81 #####
82 # System parameters appropriate for Solaris 9 and later

84 TLI             = -DTLI
85 BUGS            = -DGETPEERNAME_BUG -DBROKEN_FGETS -DLIBC_CALLS_STRTOK
86 NETGROUP        = -DNETGROUP

88 #####
89 # Start of the optional stuff.

91 #####
92 # Optional: Turning on language extensions
93 #
94 # Instead of the default access control language that is documented in
95 # the hosts_access.5 document, the wrappers can be configured to
96 # implement an extensible language documented in the hosts_options.5
97 # document. This language is implemented by the "options.c" source
98 # module, which also gives hints on how to add your own extensions.
99 # Uncomment the next definition to turn on the language extensions
100 # (examples: allow, deny, banners, twist and spawn).
101 #
102 STYLE = -DPROCESS_OPTIONS # Enable language extensions.

104 #####
105 # Optional: Reduce DNS load
106 #
107 # When looking up the address for a host.domain name, the typical DNS
108 # code will first append substrings of your own domain, so it tries
109 # host.domain.your.own.domain, then host.domain.own.domain, and then
110 # host.domain. The APPEND_DOT feature stops this waste of cycles. It is
111 # off by default because it causes problems on sites that don't use DNS
112 # and with Solaris < 2.4. APPEND_DOT will not work with hostnames taken
113 # from /etc/hosts or from NIS maps. It does work with DNS through NIS.
114 #
115 # DOT= -DAPPEND_DOT

117 #####
118 # Optional: Always attempt remote username lookups
119 #
120 # By default, the wrappers look up the remote username only when the
121 # access control rules require them to do so.
122 #
123 # Username lookups require that the remote host runs a daemon that

```

```
124 # supports an RFC 931 like protocol. Remote user name lookups are not
125 # possible for UDP-based connections, and can cause noticeable delays
126 # with connections from non-UNIX PCs. On some systems, remote username
127 # lookups can trigger a kernel bug, causing loss of service. The README
128 # file describes how to find out if your UNIX kernel has that problem.
129 #
130 # Uncomment the following definition if the wrappers should always
131 # attempt to get the remote user name. If this is not enabled you can
132 # still do selective username lookups as documented in the hosts_access.5
133 # and hosts_options.5 manual pages ('nroff -man' format).
134 #
135 #AUTH = -DALWAYS_RFC931
136 #
137 # The default username lookup timeout is 10 seconds. This may not be long
138 # enough for slow hosts or networks, but is enough to irritate PC users.
139 #
140 RFC931_TIMEOUT = 10
141 #
142 #####
143 # Optional: Changing the access control table pathnames
144 #
145 # The HOSTS_ALLOW and HOSTS_DENY macros define where the programs will
146 # look for access control information. Watch out for the quotes and
147 # backslashes when you make changes.
148 #
149 TABLES = -DHOSTS_DENY="/etc/hosts.deny\" -DHOSTS_ALLOW="/etc/hosts.allow\"
150 #
151 #####
152 # Optional: turning off hostname lookups
153 #
154 # By default, the software always attempts to look up the client
155 # hostname. With selective hostname lookups, the client hostname
156 # lookup is postponed until the name is required by an access control
157 # rule or by a %letter expansion.
158 #
159 # In order to perform selective hostname lookups, disable paranoid
160 # mode (see previous section) and comment out the following definition.
161 #
162 ALWAYS_HOSTNAME= -DALWAYS_HOSTNAME
163 #
164 ## End configuration options
