26 *
27 * The "bscbus" driver provides access to the LOMlite2 virtual registers,
28 * so that its clients (children) need not be concerned with the details
29 * of the access mechanism, which in this case is implemented via a
30 * packet-based protocol over a Xbus (similar to ebus) parallel link to the
31 * H8 host interface registers.
32 *
33 * On the other hand, this driver doesn't generally know what the virtual
34 * registers signify - only the clients need this information.
