new/usr/src/lib/libc/port/sys/sbrk.c
Code review comments from jeffpc
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

1006 # NOTE: libc.so.1 must be linked with the minimal crt1.o and crtn.o
1007 # modules whose source is provided in the $(SRC)/lib/common directory.
1008 # This must be done because otherwise the Sun C compiler would insert
1009 # its own versions of these modules and those versions contain code
1010 # to call out to C++ initialization functions. Such C++ initialization
1011 # functions can call back into libc before thread initialization is
1012 # complete and this leads to segmentation violations and other problems.
1013 # Since libc contains no C++ code, linking with the minimal crt1.o and
1014 # crtn.o modules is safe and avoids the problems described above.

114  * Long reasons must all parse/read correctly in the following contexts:
115  *
116  * "A service instance transitioned state: %s."
117  * "A service failed: %s."
118  * "Reason: %s."
119  * "The service transitioned state (%s) and ..."
120  *
121  * With the exception of restart_str_none they must also fit the following
122  * moulds:
123  *
124  * "An instance transitioned because %s, and ..."

```

```

125 * "An instance transitioned to <new-state> because %s, and ..."
126 *
127 * Note that whoever is rendering the long message must provide the
128 * terminal punctuation - don't include it here. Similarly, do not
129 * provide an initial capital letter in reason-long.
130 *
131 * The long reason strings are Volatile - within the grammatical constraints
132 * above we may improve them as need be. The intention is that a consumer
133 * may blindly render the string along the lines of the above examples,
134 * but has no other guarantees as to the exact wording. Long reasons
135 * are localized.
136 *
137 * We define revisions of the set of short reason strings in use. Within
138 * a given revision, all short reasons are Committed. Consumers must check
139 * the revision in use before relying on the semantics of the short reason
140 * codes - if the version exceeds that which they are familiar with they should
141 * fail gracefully. Having checked for version compatability, a consumer
142 * is assured that
143 *
144 *     "short_reason_A iff semantic_A", provided:
145 *
146 *         . the restarter uses this short reason code at all,
147 *         . the short reason is not "none" (which a restarter could
148 *           specify for any transition semantics)
149 *
150 * To split/refine such a Committed semantic_A into further cases,
151 * we are required to bump the revision number. This should be an
152 * infrequent occurrence. If you bump the revision number you may
153 * need to make corresponding changes in any source that calls
154 * restarter_str_version (e.g., FMA event generation).
155 *
156 * To add additional reasons to the set you must also bump the version
157 * number.
158 */

146 /*
147 * Internal interfaces for snapshot creation:
148 * _scf_snapshot_take_new(), _scf_snapshot_take_new_named(), and
149 * _scf_snapshot_take_attach() create a set of snaplevels
150 * containing frozen versions of both the instance's property groups and
151 * its parent service's property groups. _scf_snapshot_take_new() and
152 * _scf_snapshot_take_new_named() create a new snapshot to which the
153 * new snaplevels are attached, while _scf_snapshot_take_attach()
154 * attaches the new snaplevels to a pre-existing snapshot.
155 *
156 * _scf_snapshot_take_new_named() records the passed in names into the
157 * snaplevel instead of the instance and service name. This creates
158 * an inconsistency, which should be resolved by using
159 * _scf_snapshot_attach() to attach the new snaplevels to a snapshot
160 * underneath the appropriate instance. The first snapshot can
161 * then be deleted.
162 *
163 * _scf_snapshot_attach(snap1, snap2) points snap2 at the snaplevels
164 * pointed to by snap1. After a call to either
165 * _scf_snapshot_take_attach(snap1, snap2) or
166 * _scf_snapshot_attach(inst, snap), scf_snapshot_update() will be
167 * required for any open references to snap or snap2 to see the new
168 * snaplevels.
169 *
170 * _scf_snapshot_delete() deletes the snapshot object. While
171 * snaplevels, being only loosely connected to snapshots, stay
172 * around until they are no longer referenced, any references *through
173 * this snapshot object* will be invalidated.
174 *
175 * _scf_snapshot_take_new() can fail with at least HANDLE_MISMATCH,

237 * Walks all the instances matching a given fmri list. Each fmri in the array
238 * can be one of the following:
239 *
240 * - Full instance name
241 * - Full service name
242 * - Full property group or property name
243 * - Partial service or instance name
244 * - A globbed pattern
245 *
246 * The matching rules for partial fmrirs are a slightly more complex. We allow
247 * for any substring anchored at the end of the instance or service name,
248 * provided it begins with a complete element in the fmri. For example, given
249 * the fmri "svc:/system/filesystem/local:default", any of the following would
250 * be acceptable matches: 'default', 'local', 'local:default',
251 * 'filesystem/local'. The following would not be acceptable:
252 * 'system/filesystem', 'filesystem/loc', 'system/local'. Possible flag values:
253 *
254 * SCF_WALK_MULTIPLE Allow individual arguments to correspond to
255 * multiple instances.
256 */

```

```

257 *   SCF_WALK_LEGACY      Walk legacy services (indicated by a non-NULL
258 *                       property group).
259 *
260 *   SCF_WALK_SERVICE     If the user specifies a service, pass the
261 *                       service to the callback without iterating over
262 *                       its instances.
263 *
264 *   SCF_WALK_PROPERTY     Allow FMRIs which match property groups or
265 *                       individual properties. Incompatible with
266 *                       SCF_WALK_LEGACY.
267 *
268 *   SCF_WALK_NOINSTANCE  Walk only services. Must be used in
269 *                       conjunction with SCF_WALK_SERVICE.
270 *
271 *   SCF_WALK_EXPLICIT    Walk only services if the match is exact
272 *                       else return instances. Must be used in
273 *                       conjunction with SCF_WALK_SERVICE.
274 *
275 *   SCF_WALK_UNIPARTIAL  Can be combined with SCF_WALK_MULTIPLE
276 *                       so that an error is returned if a partial
277 *                       fmri matches multiple instances, unless
278 *                       a wildcard match is also used.
279 *
280 * If no arguments are given, then all instances in the service graph are
281 * walked.
282 *
283 * The second to last parameter is set to UU_EXIT_FATAL if one of the arguments
284 * is an invalid FMRI or matches multiple FMRIs when SCF_WALK_MULTIPLE is not
285 * set.
286 *
287 * The last parameter is a user-supplied error function that is called when

382 *
383 * Each scf_propvec_t represents a single property to be read (with
384 * scf_read_propvec) or written (with scf_write_propvec).
385 *
386 * The fields of a scf_propvec_t have the following meanings:
387 *
388 *   pv_prop - the name of the property

```

```

389 *   pv_desc - a description string (optional; to be consumed by the caller)
390 *   pv_type - the type of the property
391 *   pv_ptr - where to store the data read, or a pointer to the data to
392 *           be written
393 *   pv_aux - additional data influencing the interpretation of pv_ptr
394 *
395 * The meaning of pv_ptr and pv_aux depends on the type of property. For:
396 *
397 *   boolean - if pv_aux is 0, pv_ptr is a pointer to a boolean_t
398 *             if pv_aux is non-0, pv_ptr is a pointer to a uint64_t,
399 *             where pv_aux indicates the bit holding the truth value.
400 *   count - pv_ptr is a pointer to a uint64_t; pv_aux is unused
401 *   integer - pv_ptr is a pointer to an int64_t; pv_aux is unused
402 *   time - pv_ptr is a pointer to an scf_time_t; pv_aux is unused
403 *   opaque - pv_ptr is a pointer to an scf_opaque_t; pv_aux is unused
404 *   strings - (scf_read_propvec) pv_ptr is a pointer to a char *
405 *             (scf_write_propvec) pv_ptr is a pointer to an array of char
406 *             (both) pv_aux is unused

1169  * The goal of this routine is to cause the index file update and the
1170  * document save to happen as an atomic operation. We do the document
1171  * first, saving a backup copy using a hard link; if that succeeds, we go
1172  * on to the index. If that fails, we roll the document back into place.
1173  *
1174  * Strategy:
1175  *
1176  * New zone 'foo' configuration:
1177  * Create tmpfile (zonecfg.xxxxxx)
1178  * Write XML to tmpfile
1179  * Rename tmpfile to xmlfile (zonecfg.xxxxxx -> foo.xml)
1180  * Add entry to index file

```

```

1181 *      If it fails, delete foo.xml, leaving nothing behind.
1182 *
1183 * Save existing zone 'foo':
1184 *   Make backup of foo.xml -> .backup
1185 *   Create tmpfile (zonecfg.xxxxxx)
1186 *   Write XML to tmpfile
1187 *   Rename tmpfile to xmlfile (zonecfg.xxxxxx -> foo.xml)
1188 *   Modify index file as needed
1189 *   If it fails, recover from .backup -> foo.xml
1190 *
1191 * Rename 'foo' to 'bar':
1192 *   Create tmpfile (zonecfg.xxxxxx)
1193 *   Write XML to tmpfile
1194 *   Rename tmpfile to xmlfile (zonecfg.xxxxxx -> bar.xml)
1195 *   Add entry for 'bar' to index file, Remove entry for 'foo' (refresh)
1196 *   If it fails, delete bar.xml; foo.xml is left behind.

7352  * The following three routines implement a simple locking mechanism to
7353  * ensure that only one instance of zoneadm at a time is able to manipulate
7354  * a given zone. The lock is built on top of an fcntl(2) lock of
7355  * [/var/run/zones/<zonename>.zoneadm.lock. If a zoneadm instance
7356  * can grab that lock, it is allowed to manipulate the zone.
7357  *
7358  * Since zoneadm may call external applications which in turn invoke
7359  * zoneadm again, we introduce the notion of "lock inheritance". Any
7360  * instance of zoneadm that has another instance in its ancestry is assumed
7361  * to be acting on behalf of the original zoneadm, and is thus allowed to
7362  * manipulate its zone.
7363  *
7364  * This inheritance is implemented via the _ZONEADM_LOCK_HELD environment
7365  * variable. When zoneadm is granted a lock on its zone, this environment
7366  * variable is set to 1. When it releases the lock, the variable is set to
7367  * 0. Since a child process inherits its parent's environment, checking

61 Historically, the deleted-device element denoted a used-to-be
62 device element. This was used to keep track of device elements
63 deleted or modified by the user, and to cleanse /dev of such
64 entries at next zone boot.

66 With the ability to now configure devices dynamically, this
67 requirement no longer exists, but this element MUST remain in
68 perpetuity, since it is possible that an upgraded zone could
69 carry a deleted-device element, and would therefore fail XML
70 validation if removed

40 .fi
41 .SH DESCRIPTION
42 .sp
43 .LP
44 The link-editor, \fBld\fR, combines relocatable object files by resolving
45 symbol references to symbol definitions, together with performing relocations.
46 \fBld\fR operates in two modes, static or dynamic, as governed by the \fB-d\fR
47 option. In all cases, the output of \fBld\fR is left in the file \fBld.out\fR by
48 default. See NOTES.
49 .sp
50 .LP
51 In dynamic mode, \fBld-dy\fR, the default, relocatable object files that are
52 provided as arguments are combined to produce an executable object file. This
53 file is linked at execution with any shared object files that are provided as
54 arguments. If the \fB-B-G\fR option is specified, relocatable object files are
55 combined to produce a shared object. Without the \fB-B-G\fR option, a dynamic

```

```

55 executable is created.
56 .sp
57 .LP
58 In static mode, \fBld-dn\fR, relocatable object files that are provided as
59 arguments are combined to produce a static executable file. If the \fB-r\fR
60 option is specified, relocatable object files are combined to produce one
61 relocatable object file. See \fBld-static Executables\fR.
62 .sp
63 .LP
64 Dynamic linking is the most common model for combining relocatable objects, and
65 the eventual creation of processes within Solaris. This environment tightly
66 couples the work of the link-editor and the runtime linker, \fBld.so.1\fR(1).
67 Both of these utilities, together with their related technologies and
68 utilities, are extensively documented in the \fBld-linker and Libraries Guide\fR.
69 .sp
70 .LP
71 If any argument is a library, \fBld-l\fR by default searches the library exactly
72 once at the point the library is encountered on the argument list. The library
73 can be either a shared object or relocatable archive. See \fBld-library\fR(3HEAD)).
74 .sp
75 .LP
76 A shared object consists of an indivisible, whole unit that has been generated
77 by a previous link-edit of one or more input files. When the link-editor
78 processes a shared object, the entire contents of the shared object become a
79 logical part of the resulting output file image. The shared object is not
80 physically copied during the link-edit as its actual inclusion is deferred
81 until process execution. This logical inclusion means that all symbol entries
82 defined in the shared object are made available to the link-editing process.
83 See Chapter 4, \fBld-shared Objects,\fR in \fBld-linker and Libraries Guide\fR
84 .sp
85 .LP
86 For an archive library, \fBld-l\fR loads only those routines that define an
87 unresolved external reference. \fBld-l\fR searches the symbol table of the
88 archive library sequentially to resolve external references that can be
89 satisfied by library members. This search is repeated until no external
90 references can be resolved by the archive. Thus, the order of members in the
91 library is functionally unimportant, unless multiple library members exist that
92 define the same external symbol. Archive libraries that have interdependencies
93 can require multiple command line definitions, or the use of one of the
94 \fBld-l\fR \fBld-lBrescan\fR options. See \fBld-lArchive Processing\fR in \fBld-linker and
95 Libraries Guide\fR.
96 .sp
97 .LP
98 \fBld-l\fR is a cross link-editor, able to link 32-bit objects or 64-bit objects,
99 for Sparc or x86 targets. \fBld-l\fR uses the \fBld-lBelf\fR class and machine type of
100 the first relocatable object on the command line to govern the mode in which to
101 operate. The mixing of 32-bit objects and 64-bit objects is not permitted.
102 Similarly, only objects of a single machine type are allowed. See the
103 \fBld-lB-32\fR, \fBld-lB-64\fR and \fBld-lB-z target\fR options, and the \fBld-lB_NOEXEC_64\fR
104 environment variable.
105 .SS "Static Executables"
106 .sp
107 .LP
108 The creation of static executables has been discouraged for many releases. In
109 fact, 64-bit system archive libraries have never been provided. Because a
110 static executable is built against system archive libraries, the executable
111 contains system implementation details. This self-containment has a number of
112 drawbacks.
113 .RS +4
114 .TP
115 .ie t \(\bu
116 .el o
117 The executable is immune to the benefits of system patches delivered as shared
118 objects. The executable therefore, must be rebuilt to take advantage of many
119 system improvements.
120 .RE

```

```

120 .RS +4
121 .TP
122 .ie t \(bu
123 .el o
124 The ability of the executable to run on future releases can be compromised.
125 .RE
126 .RS +4
127 .TP
128 .ie t \(bu
129 .el o
130 The duplication of system implementation details negatively affects system
131 performance.
132 .RE
133 .sp
134 .LP
135 With Solaris 10, 32-bit system archive libraries are no longer provided.
136 Without these libraries, specifically \fBlibc.a\fR, the creation of static
137 executables is no longer achievable without specialized system knowledge.
138 However, the capability of \fBld\fR to process static linking options, and the
139 processing of archive libraries, remains unchanged.
140 .SH OPTIONS
141 .sp
142 The following options are supported.
143 .sp
144 .ne 2
145 .na
146 \fB-32\fR | \fB-64\fR
147 .ad
148 .sp .6
149 .RS 4n
150 Creates a 32-bit, or 64-bit object.
151 .sp
152 By default, the class of the object being generated is determined from the
153 first \fBELF\fR object processed from the command line. If no objects are
154 specified, the class is determined by the first object encountered within the
155 first archive processed from the command line. If there are no objects or
156 archives, the link-editor creates a 32-bit object.
157 .sp
158 The \fB-64\fR option is required to create a 64-bit object solely from a
159 mapfile.
160 .sp
161 This \fB-32\fR or \fB-64\fR options can also be used in the rare case of
162 linking entirely from an archive that contains a mixture of 32 and 64-bit
163 objects. If the first object in the archive is not the class of the object that
164 is required to be created, then the \fB-32\fR or \fB-64\fR option can be used
165 to direct the link-editor. See \fIThe 32-bit link-editor and 64-bit
166 link-editor\fR in \fIlinker and Libraries Guide\fR.
167 .RE
169 .sp
170 .ne 2
171 .na
172 \fB-a\fR
173 .ad
174 .sp .6
175 .RS 4n
176 In static mode only, produces an executable object file. Undefined references
177 are not permitted. This option is the default behavior for static mode. The
178 \fB-a\fR option can not be used with the \fB-r\fR option. See \fBStatic
179 Executables\fR under DESCRIPTION.
180 .RE
182 .sp
183 .ne 2
184 .na

```

```

185 \fB-b\fR
186 .ad
187 .sp .6
188 .RS 4n
189 In dynamic mode only, provides no special processing for dynamic executable
190 relocations that reference symbols in shared objects. Without the \fB-b\fR
191 option, the link-editor applies techniques within a dynamic executable so that
192 the text segment can remain read-only. One technique is the creation of special
193 position-independent relocations for references to functions that are defined
194 in shared objects. Another technique arranges for data objects that are defined
195 in shared objects to be copied into the memory image of an executable at
196 runtime.
197 .sp
198 The \fB-b\fR option is intended for specialized dynamic objects and is not
199 recommended for general use. Its use suppresses all specialized processing
200 required to ensure an object's shareability, and can even prevent the
201 relocation of 64-bit executables.
202 .RE
204 .sp
205 .ne 2
206 .na
207 \fB-B\fR | \fB-nodirect\fR
208 .ad
209 .sp .6
210 .RS 4n
211 These options govern direct binding. \fB-B\fR | \fB-nodirect\fR establishes direct
212 binding information by recording the relationship between each symbol reference
213 together with the dependency that provides the definition. In addition, direct
214 binding information is established between each symbol reference and an
215 associated definition within the object being created. The runtime linker uses
216 this information to search directly for a symbol in the associated object
217 rather than to carry out a default symbol search.
218 .sp
219 Direct binding information can only be established to dependencies specified
220 with the link-edit. Thus, you should use the \fB-z\fR | \fB-undef\fR option.
221 Objects that wish to interpose on symbols in a direct binding environment
222 should identify themselves as interposers with the \fB-z\fR | \fB-binterpose\fR
223 option. The use of \fB-B\fR | \fB-nodirect\fR enables \fB-z\fR | \fB-blazyload\fR for
224 all dependencies.
225 .sp
226 The \fB-B\fR | \fB-nodirect\fR option prevents any direct binding to the
227 interfaces offered by the object being created. The object being created can
228 continue to directly bind to external interfaces by specifying the \fB-z\fR
229 | \fB-nodirect\fR option. See Appendix D, \fIIDL Direct Bindings\fR in \fIlinker and
230 Libraries Guide\fR.
231 .RE
233 .sp
234 .ne 2
235 .na
236 \fB-dynamic\fR | \fB-static\fR
237 .ad
238 .sp .6
239 .RS 4n
240 Options governing library inclusion. \fB-dynamic\fR | \fB-static\fR is valid in dynamic
241 mode only. These options can be specified any number of times on the command
242 line as toggles: if the \fB-dynamic\fR | \fB-static\fR option is given, no shared
243 objects are accepted until \fB-dynamic\fR | \fB-static\fR is seen. See the \fB-l\fR
244 option.
245 .RE
247 .sp
248 .ne 2
249 .na
250 \fB-B\fR | \fB-eliminate\fR

```

```

251 .ad
252 .sp .6
253 .RS 4n
254 Causes any global symbols, not assigned to a version definition, to be
255 eliminated from the symbol table. Version definitions can be supplied by means
256 of a \fBmapfile\fR to indicate the global symbols that should remain visible in
257 the generated object. This option achieves the same symbol elimination as the
258 \fIauto-elimination\fR directive that is available as part of a \fBmapfile\fR
259 version definition. This option can be useful when combining versioned and
260 non-versioned relocatable objects. See also the \fB-B\fR \fBlocal\fR option and
261 the \fB-B\fR \fBreduce\fR option. See \fIDefining Additional Symbols with a
262 mapfile\fR in \fIILinker and Libraries Guide\fR.
263 .RE

265 .sp
266 .ne 2
267 .na
268 \fB-B\fR \fBgroup\fR
269 .ad
270 .sp .6
271 .RS 4n
272 Establishes a shared object and its dependencies as a group. Objects within the
273 group are bound to other members of the group at runtime. This mode is similar
274 to adding the object to the process by using \fBdlopen\fR(3C) with the
275 \fBRTLD_GROUP\fR mode. An object that has an explicit dependency on a object
276 identified as a group, becomes a member of the group.
277 .sp
278 As the group must be self contained, use of the \fB-B\fR \fBgroup\fR option
279 also asserts the \fB-z\fR \fBdefs\fR option.
280 .RE

282 .sp
283 .ne 2
284 .na
285 \fB-B\fR \fBlocal\fR
286 .ad
287 .sp .6
288 .RS 4n
289 Causes any global symbols, not assigned to a version definition, to be reduced
290 to local. Version definitions can be supplied by means of a \fBmapfile\fR to
291 indicate the global symbols that should remain visible in the generated object.
292 This option achieves the same symbol reduction as the \fIauto-reduction\fR
293 directive that is available as part of a \fBmapfile\fR version definition. This
294 option can be useful when combining versioned and non-versioned relocatable
295 objects. See also the \fB-B\fR \fBeliminate\fR option and the \fB-B\fR
296 \fBreduce\fR option. See \fIDefining Additional Symbols with a mapfile\fR in
297 \fIILinker and Libraries Guide\fR.
298 .RE

300 .sp
301 .ne 2
302 .na
303 \fB-B\fR \fBreduce\fR
304 .ad
305 .sp .6
306 .RS 4n
307 When generating a relocatable object, causes the reduction of symbolic
308 information defined by any version definitions. Version definitions can be
309 supplied by means of a \fBmapfile\fR to indicate the global symbols that should
310 remain visible in the generated object. By default, when a relocatable object
311 is generated, version definitions are only recorded in the output image. The
312 actual reduction of symbolic information is carried out when the object is used
313 in the construction of a dynamic executable or shared object. The \fB-B\fR
314 \fBreduce\fR option is applied automatically when a dynamic executable or
315 shared object is created.
316 .RE

```

```

318 .sp
319 .ne 2
320 .na
321 \fB-B\fR \fBsymbolic\fR
322 .ad
323 .sp .6
324 .RS 4n
325 In dynamic mode only. When building a shared object, binds references to global
326 symbols to their definitions, if available, within the object. Normally,
327 references to global symbols within shared objects are not bound until runtime,
328 even if definitions are available. This model allows definitions of the same
329 symbol in an executable or other shared object to override the object's own
330 definition. \fBld\fR issues warnings for undefined symbols unless \fB-z\fR
331 \fBdefs\fR overrides.
332 .sp
333 The \fB-B\fR \fBsymbolic\fR option is intended for specialized dynamic objects
334 and is not recommended for general use. To reduce the runtime relocation
335 processing that is required an object, the creation of a version definition is
336 recommended.
337 .RE

339 .sp
340 .ne 2
341 .na
342 \fB-B\fR \fBc\fR \fIname\fR
343 .ad
344 .sp .6
345 .RS 4n
346 Records the configuration file \fIname\fR for use at runtime. Configuration
347 files can be employed to alter default search paths, provide a directory cache,
348 together with providing alternative object dependencies. See \fBcrle\fR(1).
349 .RE

351 .sp
352 .ne 2
353 .na
354 \fB-B\fR \fBc\fR
355 .ad
356 .sp .6
357 .RS 4n
358 Demangles C++ symbol names displayed in diagnostic messages.
359 .RE

361 .sp
362 .ne 2
363 .na
364 \fB-B\fR \fBd\fR \fBy\fR | \fBn\fR
365 .ad
366 .sp .6
367 .RS 4n
368 When \fB-B\fR \fBy\fR, the default, is specified, \fBld\fR uses dynamic
369 linking. When \fB-B\fR \fBn\fR is specified, \fBld\fR uses static linking. See
370 \fBStatic Executables\fR under DESCRIPTION, and \fB-B\fR
371 \fBdynamic\fR|\fBstatic\fR.
372 .RE

374 .sp
375 .ne 2
376 .na
377 \fB-B\fR \fB-D\fR \fItoken\fR,...\fR
378 .ad
379 .sp .6
380 .RS 4n
381 Prints debugging information as specified by each \fItoken\fR, to the standard
382 error. The special token \fBhelp\fR indicates the full list of tokens

```

```

383 available. See \fIDebugging Aids\fR in \fILinker and Libraries Guide\fR.
384 .RE

386 .sp
387 .ne 2
388 .na

507 .na
508 \fB\fB--library\fR \fIx\fR\fR
509 .ad
510 .sp .6
511 .RS 4n
512 Searches a library \fBlib\fR\fIx\fR\fB.so\fR or \fBlib\fR\fIx\fR\fB.a\fR,
513 the conventional names for shared object and archive libraries, respectively.
514 In dynamic mode, unless the \fB-B\fR \fBbstatic\fR option is in effect, \fBld\fR

```

515 searches each directory specified in the library search path for a
 516 `\fBlib\fR\fIx\fR\FB\&.so\fR` or `\fBlib\fR\fIx\fR\FB\&.a\fR` file. The directory
 517 search stops at the first directory containing either. `\fBld\fR` chooses the
 518 file ending in `\fB\&.so\fR` if `\fB-l\fR\fIx\fR` expands to two files with names
 519 of the form `\fBlib\fR\fIx\fR\FB\&.so\fR` and `\fBlib\fR\fIx\fR\FB\&.a\fR`. If no
 520 `\fBlib\fR\fIx\fR\FB\&.so\fR` is found, then `\fBld\fR` accepts
 521 `\fBlib\fR\fIx\fR\FB\&.a\fR`. In static mode, or when the `\fB-B\fR \fBstatic\fR`
 522 option is in effect, `\fBld\fR` selects only the file ending in `\fB\&.a\fR`.
 523 `\fBld\fR` searches a library when the library is encountered, so the placement
 524 of `\fB-l\fR` is significant. See `\fILinking With Additional Libraries\fR` in
 525 `\fILinker and Libraries Guide\fR`.

 677 .ad
 678 .sp .6
 679 .RS 4n
 680 A colon-separated list of directories used to specify library search
 681 directories to the runtime linker. If present and not NULL, the path is
 682 recorded in the output object file and passed to the runtime linker. Multiple
 683 instances of this option are concatenated together with each `\fIpath\fR`
 684 separated by a colon. See `\fIIDirectories Searched by the Runtime Linker\fR` in
 685 `\fIILinker and Libraries Guide\fR`.
 686 .sp
 687 The use of a `runpath` within an associated object is preferable to setting
 688 global search paths such as through the `\fBLD_LIBRARY_PATH\fR` environment
 689 variable. Only the `runpaths` that are necessary to find the objects dependencies
 690 should be recorded. `\fBldd\fR(1)` can also be used to discover unused `runpaths`
 691 in dynamic objects, when used with the `\fB-U\fR` option.
 692 .sp
 693 Various tokens can also be supplied with a `runpath` that provide a flexible
 694 means of identifying system capabilities or an objects location. See Appendix
 695 C, `\fIEstablishing Dependencies with Dynamic String Tokens,\fR` in `\fIILinker` and
 696 `\fILibraries Guide\fR`. The `\fB$ORIGIN\fR` token is especially useful in allowing
 697 dynamic objects to be relocated to different locations in the file system.

860 .ne 2
861 .na
862 #endif /* ! codereview */
863 \fB\fB-z\fR \fBcombrelloc\fR | \fBnocombrelloc\fR\fR
864 .ad
865 .sp .6
866 .RS 4n
867 By default, \fBld\fR combines multiple relocation sections when building
868 executables or shared objects. This section combination differs from
869 relocatable objects, in which relocation sections are maintained in a
870 one-to-one relationship with the sections to which the relocations must be
871 applied. The \fB-z\fR \fBnocombrelloc\fR option disables this merging of
872 relocation sections, and preserves the one-to-one relationship found in the
873 original relocatable objects.
874 .sp
875 \fBld\fR sorts the entries of data relocation sections by their symbol
876 reference. This sorting reduces runtime symbol lookup. When multiple relocation
877 sections are combined, this sorting produces the least possible relocation
878 overhead when objects are loaded into memory, and speeds the runtime loading of
879 dynamic objects.
880 .sp
881 Historically, the individual relocation sections were carried over to any
882 executable or shared object, and the \fB-z\fR \fBcombrelloc\fR option was
883 required to enable the relocation section merging previously described.
884 Relocation section merging is now the default. The \fB-z\fR \fBcombrelloc\fR
885 option is still accepted for the benefit of old build environments, but the
886 option is unnecessary, and has no effect.

1226 .na
1227 \fB\fB-z\fR \fBld64\fR=\fIarg1\fR,\fIarg2\fR,...\fR
1228 .ad
1229 .sp .6
1230 .RS 4n
1231 The class of the link-editor is affected by the class of the output file being
1232 created and by the capabilities of the underlying operating system. The
1233 \fB-z\fR \fBld\fR[\fB32\fR|\fB64\fR] options provide a means of defining any
1234 link-editor argument. The defined argument is only interpreted, respectively,
1235 by the 32-bit class or 64-bit class of the link-editor.
1236 .sp
1237 For example, support libraries are class specific, so the correct class of
1238 support library can be ensured using:
1239 .sp
1240 .in +2

```

```

1241 .nf
1242 \fBld ... -z ld32=-Saudit32.so.1 -z ld64=-Saudit64.so.1 ... \fR
1243 .fi
1244 .in -2
1245 .sp

1247 The class of link-editor that is invoked is determined from the \fBELF\fR class
1248 of the first relocatable file that is seen on the command line. This
1249 determination is carried out \fBprior\fR to any \fB-z\fR
1250 \fBld\fR[\fB32\fR|\fB64\fR] processing.
1251 .RE

1301 .ad
1302 .sp .6
1303 .RS 4n
1304 Marks the object so that the runtime default library search path, used after
1305 any \fBLD_LIBRARY_PATH\fR or runpaths, is ignored. This option implies that all
1306 dependencies of the object can be satisfied from its runpath.

```

```

1307 .RE
1309 .sp
1310 .ne 2
1311 .na
1312 \fB\fB-z\fR \fBnodelate\fR\fR
1313 .ad
1314 .sp .6
1315 .RS 4n
1316 Marks the object as non-deletable at runtime. This mode is similar to adding
1317 the object to the process by using \fBdlopen\fR(3C) with the
1318 \fBRTLD_NODELETE\fR mode.
1319 .RE
1321 .sp
1322 .ne 2
1323 .na
1324 \fB\fB-z\fR \fBnodlopen\fR\fR
1325 .ad
1326 .sp .6
1327 .RS 4n
1328 Marks the object as not available to \fBdlopen\fR(3C), either as the object
1329 specified by the \fBdlopen()\fR, or as any form of dependency required by the
1330 object specified by the \fBdlopen()\fR. This option is only meaningful when
1331 building a shared object.
1332 .RE
1334 .sp
1335 .ne 2
1336 .na
1337 \fB\fB-z\fR \fBnodump\fR\fR
1338 .ad
1339 .sp .6
1340 .RS 4n
1341 Marks the object as not available to \fBldump\fR(3C).
1342 .RE
1344 .sp
1345 .ne 2
1346 .na
1347 \fB\fB-z\fR \fBnoldynsym\fR\fR
1348 .ad
1349 .sp .6
1350 .RS 4n
1351 Prevents the inclusion of a \fB&.SUNW_ldynsym\fR section in dynamic
1352 executables or sharable libraries. The \fB&.SUNW_ldynsym\fR section augments
1353 the \fB&.dynsym\fR section by providing symbols for local functions. Local
1354 function symbols allow debuggers to display local function names in stack
1355 traces from stripped programs. Similarly, \fBldaddr\fR(3C) is able to supply
1356 more accurate results.
1357 .sp
1358 The \fB-z\fR \fBnoldynsym\fR option also prevents the inclusion of the two
1359 symbol sort sections that are related to the \fB&.SUNW_ldynsym\fR section. The
1360 \fB&.SUNW_dynsymsort\fR section provides sorted access to regular function and
1361 variable symbols. The \fB&.SUNW_dyntlssort\fR section provides sorted access
1362 to thread local storage (\fBTLS\fR) variable symbols.
1363 .sp
1364 The \fB&.SUNW_ldynsym\fR, \fB&.SUNW_dynsymsort\fR, and
1365 \fB&.SUNW_dyntlssort\fR sections, which becomes part of the allocable text
1366 segment of the resulting file, cannot be removed by \fBstrip\fR(1). Therefore,
1367 the \fB-z\fR \fBnoldynsym\fR option is the only way to prevent their inclusion.
1368 See the \fB-s\fR and \fB-z\fR \fBbredlocs\fR options.

 1453 .RS 4n
 1454 \fBld\fR normally issues a fatal error upon encountering a relocation using a
 1455 symbol that references an eliminated COMDAT section. If \fB-z\fR
 1456 \fBrelaxreloc\fR is enabled, \fBld\fR instead redirects such relocations to the
 1457 equivalent symbol in the COMDAT section that was kept. \fB-z\fR
 1458 \fBrelaxreloc\fR is a specialized option, mainly of interest to compiler
 1459 authors, and is not intended for general use.
 1460 .RE

1462 .sp
 1463 .ne 2
 1464 .na
 1465 \fB\fB-z\fR \fBrescan-now\fR
 1466 .ad
 1467 .br
 1468 .na
 1469 \fB\fB-z\fR \fBrescan\fR
 1470 .ad
 1471 .sp .6
 1472 .RS 4n
 1473 These options rescan the archive files that are provided to the link-edit. By
 1474 default, archives are processed once as the archives appear on the command
 1475 line. Archives are traditionally specified at the end of the command line so
 1476 that their symbol definitions resolve any preceding references. However,
 1477 specifying archives multiple times to satisfy their own interdependencies can
 1478 be necessary.
 1479 .sp
 1480 \fB-z\fR \fBrescan-now\fR is a positional option, and is processed by the
 1481 link-editor immediately when encountered on the command line. All archives seen
 1482 on the command line up to that point are immediately reprocessed in an attempt
 1483 to locate additional archive members that resolve symbol references. This
 1484 archive rescanning is repeated until a pass over the archives occurs in which
 1485 no new members are extracted.
 1486 .sp
 1487 \fB-z\fR \fBrescan\fR is a position independent option. The link-editor defers
 1488 the rescan operation until after it has processed the entire command line, and
 1489 then initiates a final rescan operation over all archives seen on the command
 1490 line. The \fB-z\fR \fBrescan\fR operation can interact incorrectly
 1491 with objects that contain initialization (.init) or finalization (.fini)
 1492 sections, preventing the code in those sections from running. For this reason,
 1493 \fB-z\fR \fBrescan\fR is deprecated, and use of \fB-z\fR \fBrescan-now\fR is
 1494 advised.

 1528 Specifies the machine type for the output object. Supported targets are Sparc
 1529 and x86. The 32-bit machine type for the specified target is used unless the
 1530 \fB-64\fR option is also present, in which case the corresponding 64-bit
 1531 machine type is used. By default, the machine type of the object being
 1532 generated is determined from the first \fBELF\fR object processed from the
 1533 command line. If no objects are specified, the machine type is determined by
 1534 the first object encountered within the first archive processed from the
 1535 command line. If there are no objects or archives, the link-editor assumes the
 1536 native machine. This option is useful when creating an object directly with
 1537 \fBld\fR whose input is solely from a \fBmapfile\fR. See the \fB-M\fR option.
 1538 It can also be useful in the rare case of linking entirely from an archive that
 1539 contains objects of different machine types for which the first object is not
 1540 of the desired machine type. See \fIThe 32-bit link-editor and 64-bit
 1541 link-editor\fR in \fILinker and Libraries Guide\fR.

 1546 .na
 1547 \fB\fB-z\fR \fBtext\fR
 1548 .ad
 1549 .sp .6
 1550 .RS 4n
 1551 In dynamic mode only, forces a fatal error if any relocations against
 1552 non-writable, allocatable sections remain. For historic reasons, this mode is
 1553 not the default when building an executable or shared object. However, its use
 1554 is recommended to ensure that the text segment of the dynamic object being
 1555 built is shareable between multiple running processes. A shared text segment
 1556 incurs the least relocation overhead when loaded into memory. See
 1557 \fIPosition-Independent Code\fR in \fILinker and Libraries Guide\fR.
 1558 .RE

1560 .sp
 1561 .ne 2
 1562 .na
 1563 \fB\fB-z\fR \fBtextoff\fR
 1564 .ad
 1565 .sp .6
 1566 .RS 4n
 1567 In dynamic mode only, allows relocations against all allocatable sections,
 1568 including non-writable ones. This mode is the default when building a shared
 1569 object.
 1570 .RE

```

1572 .sp
1573 .ne 2
1574 .na
1575 \fB\fB-z\fR \fBtextwarn\fR\fR
1576 .ad
1577 .sp .6
1578 .RS 4n
1579 In dynamic mode only, lists a warning if any relocations against non-writable,
1580 allocatable sections remain. This mode is the default when building an
1581 executable.
1582 .RE

1584 .sp
1585 .ne 2
1586 .na
1587 \fB\fB-z\fR \fBverbose\fR\fR
1588 .ad
1589 .sp .6
1590 .RS 4n
1591 This option provides additional warning diagnostics during a link-edit.
1592 Presently, this option conveys suspicious use of displacement relocations. This
1593 option also conveys the restricted use of static \fBTLS\fR relocations when
1594 building shared objects. In future, this option might be enhanced to provide
1595 additional diagnostics that are deemed too noisy to be generated by default.
1596 .RE

1598 .sp
1599 .ne 2
1600 .na
1601 \fB\fB-z\fR \fBwrap=\fR \fIsymbol\fR\fR
1602 .ad
1603 .br
1604 .na
1605 \fB\fB-wrap=\fR \fIsymbol\fR\fR
1606 .ad
1607 .br
1608 .na
1609 \fB\fB--wrap=\fR \fIsymbol\fR\fR
1610 .ad
1611 .sp .6
1612 .RS 4n
1613 Rename undefined references to \fIsymbol\fR in order to allow wrapper code to
1614 be linked into the output object without having to modify source code. When
1615 \fB-z wrap\fR is specified, all undefined references to \fIsymbol\fR are
1616 modified to reference \fB__wrap_\fR \fIsymbol\fR, and all references to
1617 \fB__real_\fR \fIsymbol\fR are modified to reference \fIsymbol\fR. The user is
1618 expected to provide an object containing the \fB__wrap_\fR \fIsymbol\fR
1619 function. This wrapper function can call \fB__real_\fR \fIsymbol\fR in order to
1620 reference the actual function being wrapped.
1621 .sp
1622 The following is an example of a wrapper for the \fBmalloc\fR(3C) function:
1623 .sp
1624 .in +2
1625 .nf
1626 void *
1627 __wrap_malloc(size_t c)
1628 {
1629     (void) printf("malloc called with %zu\n", c);
1630     return (__real_malloc(c));
1631 }
1632 .fi
1633 .in -2

1635 If you link other code with this file using \fB-z\fR \fBwrap=malloc\fR to
1636 compile all the objects, then all calls to \fBmalloc\fR will call the function

```

```

1637 \fB__wrap_malloc\fR instead. The call to \fB__real_malloc\fR will call the real
1638 \fBmalloc\fR function.
1639 .sp
1640 The real and wrapped functions should be maintained in separate source files.
1641 Otherwise, the compiler or assembler may resolve the call instead of leaving
1642 that operation for the link-editor to carry out, and prevent the wrap from
1643 occurring.
1644 .RE

1646 .SH ENVIRONMENT VARIABLES
1647 .sp
1648 .ne 2
1649 .na
1649 \fB\fBLD_ALTEXEC\fR\fR
1650 .ad
1651 .sp .6
1652 .RS 4n
1653 An alternative link-editor path name. \fBld\fR executes, and passes control to
1654 this alternative link-editor. This environment variable provides a generic
1655 means of overriding the default link-editor that is called from the various
1656 compiler drivers. See the \fB-z altextec64\fR option.
1657 .RE

1659 .sp
1660 .ne 2
1661 .na
1662 \fB\fBLD_LIBRARY_PATH\fR\fR
1663 .ad
1664 .sp .6
1665 .RS 4n
1666 A list of directories in which to search for the libraries specified using the
1667 \fB-L\fR option. Multiple directories are separated by a colon. In the most
1668 general case, this environment variable contains two directory lists separated
1669 by a semicolon:
1670 .sp
1671 .in +2
1672 .nf
1673 \fIdirlist1\fR \fB;\fR \fIdirlist2\fR
1674 .fi
1675 .in -2
1676 .sp

1678 If \fBld\fR is called with any number of occurrences of \fB-L\fR, as in:
1679 .sp
1680 .in +2
1681 .nf
1682 \fBld ... -L\fIpath1\fR ... -L\fIpathn\fR ... \fR
1683 .fi
1684 .in -2
1685 .sp

1687 then the search path ordering is:
1688 .sp
1689 .in +2
1690 .nf
1691 \fB\fIdirlist1 path1\fR ... \fIpathn dirlist2\fR LIBPATH\fR
1692 .fi
1693 .in -2
1694 .sp

1696 When the list of directories does not contain a semicolon, the list is
1697 interpreted as \fIdirlist2\fR.
1698 .sp
1699 The \fBLD_LIBRARY_PATH\fR environment variable also affects the runtime linkers
1700 search for dynamic dependencies.
1701 .sp

```

1702 This environment variable can be specified with a `_32` or `_64` suffix. This makes
 1703 the environment variable specific, respectively, to 32-bit or 64-bit processes
 1704 and overrides any non-suffixed version of the environment variable that is in
 1705 effect.
 1706 .RE

1708 .sp
 1709 .ne 2
 1710 .na
 1711 \fB\fBLD_NOEXEC_64\fR\fR
 1712 .ad
 1713 .sp .6
 1714 .RS 4n
 1715 Suppresses the automatic execution of the 64-bit link-editor. By default, the
 1716 link-editor executes the 64-bit version when the `\fBELF\fR` class of the first
 1717 relocatable file identifies a 64-bit object. The 64-bit image that a 32-bit
 1718 link-editor can create, has some limitations. However, some link-edits might
 1719 find the use of the 32-bit link-editor faster.
 1720 .RE

1722 .sp
 1723 .ne 2
 1724 .na
 1725 \fB\fBLD_OPTIONS\fR\fR
 1726 .ad
 1727 .sp .6
 1728 .RS 4n
 1729 A default set of options to `\fBld\fR`. `\fBLD_OPTIONS\fR` is interpreted by
 1730 `\fBld\fR` just as though its value had been placed on the command line,
 1731 immediately following the name used to invoke `\fBld\fR`, as in:
 1732 .sp
 1733 .in +2
 1734 .nf
 1735 \fBld \$LD_OPTIONS ... \fIother-arguments\fR ... \fR
 1736 .fi
 1737 .in -2
 1738 .sp

1740 .RE

1845 .LP
1846 \fILinker and Libraries Guide\fR
1847 .SH NOTES
1848 .sp
1849 .LP
1849 Default options applied by \fBld\fR are maintained for historic reasons. In
1850 today's programming environment, where dynamic objects dominate, alternative
1851 defaults would often make more sense. However, historic defaults must be
1852 maintained to ensure compatibility with existing program development
1853 environments. Historic defaults are called out wherever possible in this
1854 manual. For a description of the current recommended options, see Appendix A,
1855 \fILink-Editor Quick Reference,\fR in \fILinker and Libraries Guide\fR.
1856 .sp
1857 .LP
1858 If the file being created by \fBld\fR already exists, the file is unlinked
1859 after all input files have been processed. A new file with the specified name
1860 is then created. This allows \fBld\fR to create a new version of the file,
1861 while simultaneously allowing existing processes that are accessing the old
1862 file contents to continue running. If the old file has no other links, the disk
1863 space of the removed file is freed when the last process referencing the file
1864 terminates.
1865 .sp
1866 .LP
1867 The behavior of \fBld\fR when the file being created already exists was changed
1868 with \fBSXCE\fR build \fB43\fR. In older versions, the existing file was
1869 rewritten in place, an approach with the potential to corrupt any running
1870 processes that is using the file. This change has an implication for output
1871 files that have multiple hard links in the file system. Previously, all links
1872 would remain intact, with all links accessing the new file contents. The new
1873 \fBld\fR behavior \fBbreaks\fR such links, with the result that only the
1874 specified output file name references the new file. All the other links
1875 continue to reference the old file. To ensure consistent behavior, applications
1876 that rely on multiple hard links to linker output files should explicitly
1877 remove and relink the other file names.
```

36.SH \"DESCRIPTION\"
37 The first invocation of the \fBpsecflags\fR command runs the specified
38 \fIcommand\fR with the security-flags modified as described by the \fI-s\fR
39 argument.
40 .P
41 The second invocation modifies the security-flags of the processes described
42 by \fIidtype\fR and \fIid\fR according as described by the \fI-s\fR argument.
43 .P
44 The third invocation describes the security-flags of the specified processes
45 or core files. The effective set is signified by '\fBE\fR', the inheritable
46 set by '\fBI\fR', the lower set by '\fBL\fR', and the upper set by '\fBU\fR'.
47 .P
48 The fourth invocation lists the supported process security-flags, documented
49 in \fBsecurity-flags\fR(5).

51.SH \"OPTIONS\"
52 The following options are supported:
53 .sp
54 .ne 2
55 .na
56 \fB-e\fR
57 .ad

```

```

58 .RS 11n
59 Interpret the remaining arguments as a command line and run the command with
60 the security-flags specified with the \fI-s\fR flag.
61 .RE

31 .SH DESCRIPTION
32 .sp
32 .LP
33 The \\fbzonecfg\\fR utility creates and modifies the configuration of a zone.
34 Zone configuration consists of a number of resources and properties.
35 .sp
36 .LP
37 To simplify the user interface, \\fbzonecfg\\fR uses the concept of a scope. The
38 default scope is global.
39 .sp
40 .LP
41 The following synopsis of the \\fbzonecfg\\fR command is for interactive usage:
42 .sp
43 .in +2
44 .nf
45 zonecfg \\fB-z\\fR \\fIzonename subcommand\\fR
46 .fi
47 .in -2
48 .sp

50 .sp
51 .LP
52 Parameters changed through \\fbzonecfg\\fR do not affect a running zone. The zone
53 must be rebooted for the changes to take effect.
54 .sp
55 .LP

```

```

56 In addition to creating and modifying a zone, the \\fbzonecfg\\fR utility can
57 also be used to persistently specify the resource management settings for the
58 global zone.
59 .sp
60 .LP
61 In the following text, "rctl" is used as an abbreviation for "resource
62 control". See \\fBresource_controls\\fR(5).
63 .sp
64 .LP
65 Every zone is configured with an associated brand. The brand determines the
66 user-level environment used within the zone, as well as various behaviors for
67 the zone when it is installed, boots, or is shutdown. Once a zone has been
68 installed the brand cannot be changed. The default brand is determined by the
69 installed distribution in the global zone. Some brands do not support all of
70 the \\fbzonecfg\\fR properties and resources. See the brand-specific man page for
71 more details on each brand. For an overview of brands, see the \\fBbrands\\fR(5)
72 man page.
73 .SS "Resources"
74 .sp
75 .LP
75 The following resource types are supported:
76 .sp
77 .ne 2
78 .na
79 \\fB\\fbattr\\fR\\fR
80 .ad
81 .sp .6
82 .RS 4n

447 .LP
448 As for the property values which are paired with these names, they are either
449 simple, complex, or lists. The type allowed is property-specific. Simple values

```

```

450 are strings, optionally enclosed within quotation marks. Complex values have
451 the syntax:
452 .sp
453 .in +2
454 .nf
455 (<\fIname\fR>=<\fIvalue\fR>,<\fIname\fR>=<\fIvalue\fR>,...)
456 .fi
457 .in -2
458 .sp

460 .sp
461 .LP
462 where each <\fIvalue\fR> is simple, and the <\fIname\fR> strings are unique
463 within a given property. Lists have the syntax:
464 .sp
465 .in +2
466 .nf
467 [<\fIvalue\fR>,...]
468 .fi
469 .in -2
470 .sp

472 .sp
473 .LP
474 where each <\fIvalue\fR> is either simple or complex. A list of a single value
475 (either simple or complex) is equivalent to specifying that value without the
476 list syntax. That is, "foo" is equivalent to "[foo]". A list can be empty
477 (denoted by "[]").
478 .sp
479 .LP
480 In interpreting property values, \fBzoncfg\fR accepts regular expressions as
481 specified in \fBfnmatch\fR(5). See \fBEXAMPLES\fR.
482 .sp
483 .LP
484 The property types are described as follows:
485 .sp
486 .ne 2
487 .na
488 \fBglobal: \fBzonename\fR\fR
489 .ad
490 .sp .6
491 .RS 4n
492 The name of the zone.
493 .RE

495 .sp
496 .ne 2
497 .na
498 \fBglobal: \fBzonepath\fR\fR
499 .ad
500 .sp .6
501 .RS 4n
502 Path to zone's file system.
503 .RE

505 .sp
506 .ne 2
507 .na
508 \fBglobal: \fBautoboot\fR\fR
509 .ad
510 .sp .6
511 .RS 4n
512 Boolean indicating that a zone should be booted automatically at system boot.
513 Note that if the zones service is disabled, the zone will not autoboot,
514 regardless of the setting of this property. You enable the zones service with a
515 \fBsvcadm\fR command, such as:

```

```

516 .sp
517 .in +2
518 .nf
519 # \fBsvcadm enable svc:/system/zones:default\fR
520 .fi
521 .in -2
522 .sp

524 Replace \fBenable\fR with \fBdisable\fR to disable the zones service. See
525 \fBsvcadm\fR(1M).
526 .RE

528 .sp
529 .ne 2
530 .na
531 \fBglobal: \fBbootargs\fR\fR
532 .ad
533 .sp .6
534 .RS 4n
535 Arguments (options) to be passed to the zone bootup, unless options are
536 supplied to the "\fBzoneadm boot\fR" command, in which case those take
537 precedence. The valid arguments are described in \fBzoneadm\fR(1M).
538 .RE

540 .sp
541 .ne 2
542 .na
543 \fBglobal: \fBpool\fR\fR
544 .ad
545 .sp .6
546 .RS 4n
547 Name of the resource pool that this zone must be bound to when booted. This
548 property is incompatible with the \fBdedicated-cpu\fR resource.
549 .RE

551 .sp
552 .ne 2
553 .na
554 \fBglobal: \fBlimitpriv\fR\fR
555 .ad
556 .sp .6
557 .RS 4n
558 The maximum set of privileges any process in this zone can obtain. The property
559 should consist of a comma-separated privilege set specification as described in
560 \fBpriv_str_to_set\fR(3C). Privileges can be excluded from the resulting set by
561 preceding their names with a dash (-) or an exclamation point (!). The special
562 privilege string "zone" is not supported in this context. If the special string
563 "default" occurs as the first token in the property, it expands into a safe set
564 of privileges that preserve the resource and security isolation described in
565 \fBzones\fR(5). A missing or empty property is equivalent to this same set of
566 safe privileges.
567 .sp
568 The system administrator must take extreme care when configuring privileges for
569 a zone. Some privileges cannot be excluded through this mechanism as they are
570 required in order to boot a zone. In addition, there are certain privileges
571 which cannot be given to a zone as doing so would allow processes inside a zone
572 to unduly affect processes in other zones. \fBzoneadm\fR(1M) indicates when an
573 invalid privilege has been added or removed from a zone's privilege set when an
574 attempt is made to either "boot" or "ready" the zone.
575 .sp
576 See \fBprivileges\fR(5) for a description of privileges. The command "\fBpriv
577 -l\fR" (see \fBpriv\fR(1)) produces a list of all Solaris privileges. You can
578 specify privileges as they are displayed by \fBpriv\fR. In
579 \fBprivileges\fR(5), privileges are listed in the form
580 PRIV_\fIprivilege_name\fR. For example, the privilege \fIisys_time\fR, as you
581 would specify it in this property, is listed in \fBprivileges\fR(5) as

```

```

582 \fBPRIV_SYS_TIME\fR.
583 .RE

585 .sp
586 .ne 2
587 .na
588 \fBglobal: \fBbrand\fR\fR
589 .ad
590 .sp .6
591 .RS 4n
592 The zone's brand type.
593 .RE

595 .sp
596 .ne 2
597 .na
598 \fBglobal: \fBip-type\fR\fR
599 .ad
600 .sp .6
601 .RS 4n
602 A zone can either share the IP instance with the global zone, which is the
603 default, or have its own exclusive instance of IP.
604 .sp
605 This property takes the values \fBshared\fR and \fBexclusive\fR.
606 .RE

608 .sp
609 .ne 2
610 .na
611 \fBglobal: \fBhostid\fR\fR
612 .ad
613 .sp .6
614 .RS 4n
615 A zone can emulate a 32-bit host identifier to ease system consolidation. A
616 zone's \fBhostid\fR property is empty by default, meaning that the zone does
617 not emulate a host identifier. Zone host identifiers must be hexadecimal values
618 between 0 and FFFFFFFE. A \fB0x\fR or \fB0X\fR prefix is optional. Both
619 uppercase and lowercase hexadecimal digits are acceptable.
620 .RE

622 .sp
623 .ne 2
624 .na
625 \fB\fBfs\fR: dir, special, raw, type, options\fR
626 .ad
627 .sp .6
628 .RS 4n
629 Values needed to determine how, where, and so forth to mount file systems. See
630 \fBmount\fR(1M), \fBmount\fR(2), \fBfsck\fR(1M), and \fBfstab\fR(4).
631 .RE

633 .sp
634 .ne 2
635 .na
636 \fB\fBnet\fR: address, physical, defrouter\fR
637 .ad
638 .sp .6
639 .RS 4n
640 The network address and physical interface name of the network interface. The
641 network address is one of:
642 .RS +4
643 .TP
644 .ie t \(\bu
645 .el o
646 a valid IPv4 address, optionally followed by "\fB/\fR" and a prefix length;
647 .RE

```

```

648 .RS +4
649 .TP
650 .ie t \(bu
651 .el o
652 a valid IPv6 address, which must be followed by "\fB\fR" and a prefix length;
653 .RE
654 .RS +4
655 .TP
656 .ie t \(bu
657 .el o
658 a host name which resolves to an IPv4 address.
659 .RE
660 Note that host names that resolve to IPv6 addresses are not supported.
661 .sp
662 The physical interface name is the network interface name.
663 .sp
664 The default router is specified similarly to the network address except that it
665 must not be followed by a \fB\fR (slash) and a network prefix length.
666 .sp
667 A zone can be configured to be either exclusive-IP or shared-IP. For a
668 shared-IP zone, you must set both the physical and address properties; setting
669 the default router is optional. The interface specified in the physical
670 property must be plumbed in the global zone prior to booting the non-global
671 zone. However, if the interface is not used by the global zone, it should be
672 configured \fBdown\fR in the global zone, and the default router for the
673 interface should be specified here.
674 .sp
675 For an exclusive-IP zone, the physical property must be set and the address and
676 default router properties cannot be set.

828 .na
829 \fB\fBdedicated-cpu\fR: ncpus, importance\fR
830 .ad
831 .sp .6
832 .RS 4n
833 The number of CPUs that should be assigned for this zone's exclusive use. The
834 zone will create a pool and processor set when it boots. See \fBpooladm\fR(1M)
835 and \fBpoolcfg\fR(1M) for more information on resource pools. The \fBncpu\fR
836 property can specify a single value or a range (for example, 1-4) of
837 processors. The \fBimportance\fR property is optional; if set, it will specify
838 the \fBpset.importance\fR value for use by \fBpoold\fR(1M). If this resource is
839 used, there must be enough free processors to allocate to this zone when it
840 boots or the zone will not boot. The processors assigned to this zone will not
841 be available for the use of the global zone or other zones. This resource is
842 incompatible with both the \fBpool\fR and \fBcpu-shares\fR properties. Only a
843 single instance of this resource can be added to the zone.
844 .RE

```

```

846 .sp
847 .ne 2
848 .na
849 \fB\fBcapped-memory\fR: physical, swap, locked\fR
850 .ad
851 .sp .6
852 .RS 4n
853 The caps on the memory that can be used by this zone. A scale (K, M, G, T) can
854 be applied to the value for each of these numbers (for example, 1M is one
855 megabyte). Each of these properties is optional but at least one property must
856 be set when adding this resource. Only a single instance of this resource can
857 be added to the zone. The \fBphysical\fR property sets the \fBmax-rss\fR for
858 this zone. This will be enforced by \fBrcapd\fR(1M) running in the global zone.
859 The \fBswap\fR property is the preferred way to set the \fBzone.max-swap\fR
860 rctl. The \fBblocked\fR property is the preferred way to set the
861 \fBzone.max-locked-memory\fR rctl.
862 .RE

864 .sp
865 .ne 2
866 .na
867 \fB\fBcapped-cpu\fR: ncpus\fR
868 .ad
869 .sp .6
870 .RS 4n
871 Sets a limit on the amount of CPU time that can be used by a zone. The unit
872 used translates to the percentage of a single CPU that can be used by all user
873 threads in a zone, expressed as a fraction (for example, \fB&.75\fR) or a
874 mixed number (whole number and fraction, for example, \fB1.25\fR). An
875 \fBncpu\fR value of \fB1\fR means 100% of a CPU, a value of \fB1.25\fR means
876 125%, \fB&.75\fR mean 75%, and so forth. When projects within a capped zone
877 have their own caps, the minimum value takes precedence.
878 .sp
879 The \fBcapped-cpu\fR property is an alias for \fBzone.cpu-cap\fR resource
880 control and is related to the \fBzone.cpu-cap\fR resource control. See
881 \fBresource_controls\fR(5).

 969 .sp

971 .sp
 972 .LP
 973 To further specify things, the breakdown of the complex property "value" of the
 974 "rctl" resource type, it consists of three name/value pairs, the names being
 975 "priv", "limit" and "action", each of which takes a simple value. The "name"
 976 property of an "attr" resource is syntactically restricted in a fashion similar
 977 but not identical to zone names: it must begin with an alphanumeric, and can

978 contain alphanumerics plus the hyphen (\fB-\fR), underscore (\fB_\fR), and dot
 979 (\fB&.\fR) characters. Attribute names beginning with "zone" are reserved for
 980 use by the system. Finally, the "autoboot" global property must have a value of
 981 "true" or "false".

982 .SS "Using Kernel Statistics to Monitor CPU Caps"

427 .sp
 983 .LP

984 Using the kernel statistics (\fBkstat\fR(3KSTAT)) module \fBcaps\fR, the system
 985 maintains information for all capped projects and zones. You can access this
 986 information by reading kernel statistics (\fBkstat\fR(3KSTAT)), specifying
 987 \fBcaps\fR as the \fBkstat\fR module name. The following command displays
 988 kernel statistics for all active CPU caps:

989 .sp
 990 .in +2
 991 .nf
 992 # \fBkstat caps::'/cpucaps/'\fR
 993 .fi
 994 .in -2
 995 .sp

997 .sp
 998 .LP
 999 A \fBkstat\fR(1M) command running in a zone displays only CPU caps relevant for
 1000 that zone and for projects in that zone. See \fBEXAMPLES\fR.

1001 .sp
 1002 .LP

1133 See \fBEXAMPLES\fR for sample output from a \fBkstat\fR command.
1134 .SH OPTIONS
1135 .LP
1136 The following options are supported:
1137 .sp
1138 .ne 2
1139 .na
1140 \fB\fB-f\fR \fIcommand_file\fR
1141 .ad
1142 .sp .6
1143 .RS 4n
1144 Specify the name of \fBzonecfg\fR command file. \fIcommand_file\fR is a text
1145 file of \fBzonecfg\fR subcommands, one per line.
1146 .RE

1148 .sp
1149 .ne 2
1150 .na
1151 \fB\fB-z\fR \fIzonename\fR
1152 .ad
1153 .sp .6
1154 .RS 4n
1155 Specify the name of a zone. Zone names are case sensitive. Zone names must
1156 begin with an alphanumeric character and can contain alphanumeric characters,
1157 the underscore (\fB_\fR) the hyphen (\fB-\fR), and the dot (\fB&.\fR). The
1158 name \fBglobal\fR and all names beginning with \fBSUNW\fR are reserved and
1159 cannot be used.
1160 .RE

1162 .SH SUBCOMMANDS
1163 .LP
1164 You can use the \fBadd\fR and \fBselect\fR subcommands to select a specific
1165 resource, at which point the scope changes to that resource. The \fBend\fR and
1166 \fBcancel\fR subcommands are used to complete the resource specification, at
1167 which time the scope is reverted back to global. Certain subcommands, such as
1168 \fBadd\fR, \fBremove\fR and \fBset\fR, have different semantics in each scope.
1169 .sp
1170 .LP
1171 \fBzonecfg\fR supports a semicolon-separated list of subcommands. For example:
1172 .sp

```

```

1173 .in +2
1174 .nf
1175 # \fBzonecfg -z myzone "add net; set physical=myvnic; end"\fR
1176 .fi
1177 .in -2
1178 .sp

1180 .sp
1181 .LP
1182 Subcommands which can result in destructive actions or loss of work have an
1183 \fB-F\fR option to force the action. If input is from a terminal device, the
1184 user is prompted when appropriate if such a command is given without the
1185 \fB-F\fR option otherwise, if such a command is given without the \fB-F\fR
1186 option, the action is disallowed, with a diagnostic message written to standard
1187 error.
1188 .sp
1189 .LP
1190 The following subcommands are supported:
1191 .sp
1192 .ne 2
1193 .na
1194 \fB\fBadd\fR \fIresource-type\fR (global scope)\fR
1195 .ad
1196 .br
1197 .na
1198 \fB\fBadd\fR \fIproperty-name property-value\fR (resource scope)\fR
1199 .ad
1200 .sp .6
1201 .RS 4n
1202 In the global scope, begin the specification for a given resource type. The
1203 scope is changed to that resource type.
1204 .sp
1205 In the resource scope, add a property of the given name with the given value.
1206 The syntax for property values varies with different property types. In
1207 general, it is a simple value or a list of simple values enclosed in square
1208 brackets, separated by commas (\fB[foo,bar,baz]\fR). See \fBPROPERTIES\fR.
1209 .RE

1211 .sp
1212 .ne 2
1213 .na
1214 \fB\fBcancel\fR\fR
1215 .ad
1216 .sp .6
1217 .RS 4n
1218 End the resource specification and reset scope to global. Abandons any
1219 partially specified resources. \fBcancel\fR is only applicable in the resource
1220 scope.
1221 .RE

1223 .sp
1224 .ne 2
1225 .na
1226 \fB\fBclear\fR \fIproperty-name\fR\fR
1227 .ad
1228 .sp .6
1229 .RS 4n
1230 Clear the value for the property.
1231 .RE

1233 .sp
1234 .ne 2
1235 .na
1236 \fB\fBcommit\fR\fR
1237 .ad
1238 .sp .6

```

```

1239 .RS 4n
1240 Commit the current configuration from memory to stable storage. The
1241 configuration must be committed to be used by \fBzoneadm\fR. Until the
1242 in-memory configuration is committed, you can remove changes with the
1243 \fBbrevert\fR subcommand. The \fBcommit\fR operation is attempted automatically
1244 upon completion of a \fBzonecfg\fR session. Since a configuration may be
1245 correct to be committed, this operation automatically does a verify.
1246 .RE

1248 .sp
1249 .ne 2
1250 .na
1251 \fB\fBcreate [\fR\fB-F\fR\fB] [\fR \fB-a\fR \fIpath\fR |\fB-b\fR \fB|\fR
1252 \fB-t\fR \fItemplate\fR\fB]\fR
1253 .ad
1254 .sp .6
1255 .RS 4n
1256 Create an in-memory configuration for the specified zone. Use \fBcreate\fR to
1257 begin to configure a new zone. See \fBcommit\fR for saving this to stable
1258 storage.
1259 .sp
1260 If you are overwriting an existing configuration, specify the \fB-F\fR option
1261 to force the action. Specify the \fB-t\fR \fItemplate\fR option to create a
1262 configuration identical to \fItemplate\fR, where \fItemplate\fR is the name of
1263 a configured zone.
1264 .sp
1265 Use the \fB-a\fR \fIpath\fR option to facilitate configuring a detached zone on
1266 a new host. The \fIpath\fR parameter is the zonepath location of a detached
1267 zone that has been moved on to this new host. Once the detached zone is
1268 configured, it should be installed using the "\fBzoneadm attach\fR" command
1269 (see \fBzoneadm\fR(1M)). All validation of the new zone happens during the
1270 \fBattach\fR process, not during zone configuration.
1271 .sp
1272 Use the \fB-b\fR option to create a blank configuration. Without arguments,
1273 \fBcreate\fR applies the Sun default settings.
1274 .RE

1276 .sp

15 .Dt LIBPROC 3LIB
16 .Os
17 .Sh NAME
18 .Nm libproc
19 .Nd process control library
20 .Sh SYNOPSIS
21 .Lb libproc
22 .In libproc.h
23 .Sh DESCRIPTION
24 The
25 .Nm
26 library provides consumers a general series of interfaces to inspect
27 and control both live processes and core files. It is intended for
28 introspection tools such as debuggers by providing a high-level
29 interface to the /proc file system
30 .Pf ( Xr proc 4 ) .
31 .Pp
32 The
33 .Nm
34 library provides interfaces that focus on:
35 .Bl -bullet -offset indent
36 .It
37 Creating and attaching to live process, core files, and arbitrary ELF
38 objects.
39 .It
40 Interrogating the state of a process or core file.
41 .It
42 Manipulating the current state of a process or thread.
43 .It
44 Interrogating the state of threads of a process or core file.
45 .It
46 Running system calls in the context of another process.
47 .It
48 Various utilities for iterating process and core file file descriptors,
49 mappings, symbols, and more.
50 .It
51 Various utilities to support debugging tools.
52 .El
53 .Ss Live Processes
54 The
55 .Nm
56 library can be used to manipulate running processes and to create new

```

```

57 ones. To manipulate an existing process first
58 .Em grab
59 it with the
60 .Em Pgrab
61 function. A process is generally stopped as a side effect of grabbing
62 it. Callers must exercise caution, as if they do not use the library
63 correctly, or they terminate unexpectedly, a process may remain
64 stopped.
65 .Pp
66 Unprivileged users may only grab their own processes. Users with the
67 privilege
68 .Sy PRIV_PROC_OWNER
69 may manipulate processes that they do not own; however, additional
70 restrictions as described in
71 .Xr privileges 5
72 apply.
73 .Pp
74 In addition, the
75 .Fn Pcreate
76 and
77 .Fn Pxcreate
78 functions may be used to create processes which are always controlled by
79 the library.
80 .Ss Core Files
81 The
82 .Nm
83 library has the ability to open and interpret core files produced by
84 processes on the system. Process core dump generation is controlled by
85 the
86 .Xr coreadm 1M
87 command. In addition, the library has the ability to understand and
88 interpret core dumps generated by Linux kernel and can provide a subset
89 of its functionality on such core files, provided the original binary is
90 also present.
91 .Pp
92 Not all functions in the
93 .Nm
94 library are valid for core files. In general, none of the commands
95 which manipulate the current state of a process or thread or that try
96 to force system calls on a victim process will work. Furthermore
97 several of the information and iteration interfaces are limited based
98 on the data that is available in the core file. For example, if the
99 core file is of a process that omits the frame pointer, the ability to
100 iterate the stack will be limited.
101 .Pp
102 Use the
103 .Fn Pgrab_core
104 or
105 .Fn Pfgrab_core
106 function to open a core file. Use the
107 .Fn Pgrab_file
108 function to open an ELF object file.
109 This is useful for obtaining information stored in ELF headers and
110 sections.
111 .Ss Debug Information
112 Many of the operations in the library rely on debug information being
113 present in a process and its associated libraries. The library
114 leverages symbol table information, CTF data
115 .Pf ( Xr CTF 4 )
116 sections, and frame unwinding information based on the use of an ABI
117 defined frame pointer, eg.
118 .Sy %ebp
119 and
120 .Sy %rbp
121 on x86 systems.
122 .Pp

```

123 Some software providers strip programs of this information or build
 124 their executables such that the information will not be present in a
 125 core dump. To deal with this fact, the library is able to consume
 126 information that is not present in the core file or the running
 127 process. It can both consume it from the underlying executable and it
 128 also supports finding it from related ELF objects that are linked to
 129 it via the
 130 .Sy .gnu_debuglink
 131 and the
 132 .Sy .note.gnu.build-id
 133 ELF sections.
 134 .Ss Iteration Interfaces
 135 The
 136 .Nm
 137 library provides the ability to iterate over the following aspects of a
 138 process or core file:
 139 .Bl -bullet -offset indent
 140 .It
 141 Active threads
 142 .It
 143 Active and zombie threads
 144 .It
 145 All non-system processes
 146 .It
 147 All process mappings
 148 .It
 149 All objects in a process
 150 .It
 151 The environment
 152 .It
 153 The symbol table
 154 .It
 155 Stack frames
 156 .It
 157 File Descriptors
 158 .El
 159 .Ss System Call Injection
 160 The
 161 .Nm
 162 library allows the caller to force system calls to be executed in the
 163 context of the running process. This can be used both as a tool for
 164 introspection, allowing one to get information outside its current
 165 context as well as performing modifications to a process.
 166 .Pp
 167 These functions run in the context of the calling process. This is
 168 often an easier way of getting non-exported information about a
 169 process from the system. For example, the
 170 .Xr pfiles 1
 171 command uses this interface to get more detailed information about a
 172 process's open file descriptors, which it would not have access to
 173 otherwise.
 174 .Sh INTERFACES
 175 The shared object
 176 .Sy libproc.so.1
 177 provides the public interfaces defined below. See
 178 .Xr Intro 3
 179 for additional information on shared object interfaces. Functions are
 180 organized into categories that describe their purpose. Individual
 181 functions are documented in their own manual pages.
 182 .Ss Creation, Grabbing, and Releasing
 183 The following routines are related to creating library handles,
 184 grabbing cores, processes, and threads, and releasing those resources.
 185 .Bl -column -offset indent ".Sy Pmapping_iter_resolved" ".Sy Psymbol_iter_by_add

341 .El
342 .Sh PROCESS STATES
343 Every process handle that exists in
344 .Nm
345 has a state. In some cases, such as for core files, these states are
346 static. In other cases, such as handles that correspond to a
347 running process or a created process, these states are dynamic and
348 change based on actions taken in the library. The state can be obtained
349 with the
350 .Xr Pstate 3PROC
351 function.
352 .Pp
353 The various states are:
354 .Bl -tag -width Dv -offset indent
355 .It Dv PS_RUN
356 An actively running process. This may be a process that was obtained
357 by creating it with functions such as
358 .Xr Pcreate 3PROC
359 or by grabbing an existing process such as
360 .Xr Pgrab 3PROC .
361 .It Dv PS_STOP
362 An active process that is no longer executing. A process may stop for
363 many reasons such as an explicit stop request (through
364 .Xr pstop 1
365 for example) or if a tracing event is hit.
366 .Pp
367 The reason a process is stopped may be obtained through the thread's
368 .Sy lwpstatus_t
369 structure read directly from /proc or obtained through the
370 .Xr Lstatus 3PROC

```

```

371 function.
372 .It Dv PS_LOST
373 Control over the process has been lost. This may happen when the
374 process executes a new image requiring a different set of privileges.
375 To resume control call
376 .Xr Preopen 3PROC . For more information on losing control of a process,
377 see
378 .Xr proc 4 .
379 .It Dv PS_UNDEAD
380 A zombie process. It has terminated, but it has not been cleaned up
381 yet by its parent. For more on the conditions of becoming a zombie,
382 see
383 .Xr exec 2 .
384 .It Dv PS_DEAD
385 Processes in this state are always core files. See the earlier section
386 .Sx Core Files
387 for more information on working with core files.
388 .It Dv PS_IDLE
389 A process that has never been run. This is always the case for handles
390 that refer to files as the files cannot be executed. Those process
391 handles are obtained through calling
392 .Xr Pgrab_file 3PROC .
393 .El
394 .Pp
395 Many functions relating to tracing processes, for example
396 .Xr Psignal 3PROC ,
397 .Xr Psetsignal 3PROC ,
398 .Xr Psetfault 3PROC ,
399 .Xr Psetentry 3PROC ,
400 and others, mention that they only act upon
401 .Em Active Processes .
402 This specifically refers to processes whose state are in
403 .Dv PS_RUN
404 and
405 .Dv PS_STOP .
406 Process handles in the other states have no notion of settable tracing
407 flags, though core files
408 .Pf ( type Dv PS_DEAD ) ,
409 =====
410 may have a read-only snapshot of their tracing settings available.
411 .Sh TYPES
412 The
413 .Nm
414 library uses many types that come from the /proc file system
415 .Pf ( Xr proc 4 )
416 and the ELF format
417 .Pf ( Xr elf 3ELF ) .
418 However, it also defines the following types:
419 .Pp
420 .Sy struct ps_prochandle
421 .Pp
422 The
423 .Sy struct ps_prochandle
424 is an opaque handle to the library and the core element of control for a
425 process. Consumers obtain pointers to a handle through the use of the
426 .Fn Pcreate ,
427 .Fn Pgrab ,
428 and related functions. When a caller is done with a handle, then it
429 should call one of the
430 .Fn Pfree
431 and
432 .Fn Prelease
433 functions to relinquish the handle, release associated resources, and
434 potentially set the process to run again.
435 .Pp
436 .Sy struct ps_lwphandle

```

```

437 .Pp
438 The
439 .Sy struct ps_lwphandle
440 is analogous to the
441 .Sy struct ps_prochandle ,
442 but it represents the control of an individual thread, rather than a
443 process. Consumers obtain pointers to a handle through the
444 .Fn Lgrab
445 function and relinquish it with the
446 .Fn Lfree
447 function.
448 .Pp
449 .Sy core_content_t
450 .Pp
451 The
452 .Sy core_content_t
453 is a value which describes the various content types of core files.
454 These are used in functions such as
455 .Xr Pcontent 3PROC
456 and
457 .Xr Pgc core 3PROC
458 to describe and control the types of content that get included. Various
459 content types may be included together through a bitwise-inclusive-OR.
460 The default system core contents are controlled with the
461 .Xr coreadm 1M
462 tool. The following table lists the current set of core contents in the
463 system, though the set may increase over time. The string after the
464 macro is the human readable string that corresponds with the constant
465 and is used by
466 .Xr coreadm 1M ,
467 .Xr proc_content2str 3PROC ,
468 and
469 .Xr proc_str2content 3PROC .
470 .Bl -tag -offset indent -width indent
471 .It Dv CC_CONTENT_STACK ("stack")
472 The contents include the process stack. Note, this only covers the main
473 thread's stack. The stack of other threads is covered by
474 .Dv CC_CONTENT_ANON .
475 .It Dv CC_CONTENT_HEAP ("heap")
476 The contents include the process heap.
477 .It Dv CC_CONTENT_SHFILE ("shfile")
478 The contents include shared mappings that are backed by files (e.g.
479 mapped through
480 .Xr mmap 2
481 with the
482 .Dv MAP_SHARED
483 flag).
484 .It Dv CC_CONTENT_SHANNON ("shannon")
485 The contents include shared mappings that are backed by anonymous memory
486 (e.g. mapped through
487 .Xr mmap 2
488 with the
489 .Dv MAP_SHARED
490 and
491 .Dv MAP_ANON
492 flags).
493 .It Dv CC_CONTENT_RODATA ("rodata")
494 The contents include private read-only file mappings, such as shared
495 library text.
496 .It Dv CC_CONTENT_ANON ("anon")
497 The contents include private anonymous mappings. This includes the
498 stacks of threads which are not the main thread.
499 .It Dv CC_CONTENT_SHM ("shm")
500 The contents include system V shared memory.
501 .It Dv CC_CONTENT_ISM ("ism")
502 The contents include ISM (intimate shared memory) mappings.

```

```

503 .It Dv CC_CONTENT_DISM ("dism")
504 The contents include DISM (dynamic shared memory) mappings.
505 .It Dv CC_CONTENT_CTF ("ctf")
506 The contents include
507 .Xr ctf 4
508 (Compact C Type Format) information. Note, not all objects in the
509 process may have CTF information available.
510 .It Dv CC_CONTENT_SYMTAB ("symtab")
511 The contents include the symbol table. Note, not all objects in the
512 process may have a symbol table available.
513 .It Dv CC_CONTENT_ALL ("all")
514 This value indicates that all of the above content values are present.
515 Note that additional values may be added in the future, in which case
516 the value of the symbol will be updated to include them. Comparisons
517 with
518 .Dv CC_CONTENT_ALL
519 should validate all the expected bits are set by an expression such as
520 .Li (c & CC_CONTENT_ALL) == CC_CONTENT_ALL .
521 .It Dv CC_CONTENT_NONE ("none")
522 This value indicates that there is no content present.
523 .It Dv CC_CONTENT_DEFAULT ("default")
524 The content includes the following set of default values:
525 .Dv CC_CONTENT_STACK ,
526 .Dv CC_CONTENT_HEAP ,
527 .Dv CC_CONTENT_ISM ,
528 .Dv CC_CONTENT_DISM ,
529 .Dv CC_CONTENT_SHM ,
530 .Dv CC_CONTENT_SHANON ,
531 .Dv CC_CONTENT_TEXT ,
532 .Dv CC_CONTENT_DATA ,
533 .Dv CC_CONTENT_RODATA ,
534 .Dv CC_CONTENT_ANON ,
535 .Dv CC_CONTENT_CTF ,
536 and
537 .Dv CC_CONTENT_SYMTAB.
538 Note that the default may change. Comparisons with CC_CONTENT_DEFAULT
539 should validate that all of the expected bits are set with an expression
540 such as
541 .Li (c\ &\ CC_CONTENT_DEFAULT)\ ==\ CC_CONTENT_DEFAULT.
542 .It Dv CC_CONTENT_INVALID
543 This indicates that the contents are invalid.
544 .El
545 .Pp
546 .Sy prfdinfo_t
547 .Pp
548 The
549 .Sy prfdinfo_t
550 structure is used with the
551 .Fn Pfdinfo_iter
552 function which describes information about a file descriptor. The
553 structure is defined as follows:
554 .Bd -literal
555 typedef struct prfdinfo {
556     int         pr_fd;
557     mode_t      pr_mode;
558     uid_t       pr_uid;
559     gid_t       pr_gid;
560     major_t     pr_major;    /* think stat.st_dev */
561     minor_t     pr_minor;
562     major_t     pr_rmajor;   /* think stat.st_rdev */
563     minor_t     pr_rminor;
564     ino64_t     pr_ino;
565     off64_t     pr_offset;
566     off64_t     pr_size;
567     int         pr_fileflags; /* fcntl(F_GETXFL), etc */
568     int         pr_fdflags;  /* fcntl(F_GETFD), etc. */

```

```

569     char        pr_path[MAXPATHLEN];
570 } prfdinfo_t;

```

```

655 .Ed
656 .Pp
657 The member
658 .Sy prs_object
659 points to a string that contains the name of the object file, if known,
660 that the symbol comes from. The member
661 .Sy prs_name
662 points to the name of the symbol, if known. This may be unknown due to a
663 stripped binary that contains no symbol table. The member
664 .Sy prs_lmid
665 indicates the link map identifier that the symbol was found on. For more
666 information on link map identifiers refer to the
667 .Em Linker and Libraries Guide
668 and
669 .Xr dlopen 3C .
670 .Pp
671 The members
672 .Sy prs_id
673 and
674 .Sy prs_table
675 can be used to determine both the symbol table that the entry came from
676 and which entry in the table it corresponds to. If the value of
677 .Sy prs_table
678 is
679 .Dv PR_SYMTAB
680 then it came from the ELF standard symbol table. However, if it is instead
681 .Dv PR_DYNSYM ,
682 then that indicates that it comes from the process's dynamic section.
683 .Pp
684 .Sy proc_lwp_f
685 .Pp
686 The
687 .Sy proc_lwp_f
688 is a function pointer type that is used with the
689 .Fn Plwp_iter
690 function. It is defined as
691 .Sy typedef
692 .Ft int
693 .Fo proc_lwp_f
694 .Fa "void *"
695 .Fa "const lwpstatus_t *"
696 .Fc .
697 The first argument is a pointer to an argument that the user specifies,
698 while the second has the thread's status information and is defined in
699 .Xr proc 4 .
700 For additional information on using this type, see
701 .Xr Plwp_iter 3PROC .
702 .Pp
703 .Sy proc_lwp_all_f
704 .Pp
705 The
706 .Sy proc_lwp_all_f
707 is a function pointer type that is used with the
708 .Fn Plwp_iter_all
709 function. It is defined as
710 .Sy typedef
711 .Ft int
712 .Fo proc_lwp_all_f
713 .Fa "void *"
714 .Fa "const lwpstatus_t *"
715 .Fa "const lwpsinfo_t *"
716 .Fc .
717 The first argument is a pointer to an argument that the user specifies.

```

```

718 The second and third arguments contain the thread's status and
719 thread-specific
720 .Xr ps 1
721 information respectively. Both structures are defined in
722 .Xr proc 4 .
723 For additional information on using this type, see
724 .Xr Plwp_iter_all 3PROC .
725 .Pp
726 .Sy proc_walk_f
727 .Pp
728 The
729 .Sy proc_walk_f
730 is a function pointer type that is used with the
731 .Fn proc_walk
732 function. It is defined as
733 .Sy typedef
734 .Ft int
735 .Fo proc_walk_f
736 .Fa "psinfo_t *"
737 .Fa "lwpsinfo_t *"
738 .Fa "void *"
739 .Fc .
740 The first argument contains the process
741 .Xr ps 1
742 information and the second argument contains the representative thread's
743 .Xr ps 1
744 information. Both structures are defined in
745 .Xr proc 4 .
746 The final argument is a pointer to an argument that the user specifies.
747 For more information on using this, see
748 .Xr proc_walk 3PROC .
749 .Pp
750 .Sy proc_map_f
751 .Pp
752 The
753 .Sy proc_map_f
754 is a function pointer type that is used with the
755 .Fn Pmapping_iter ,
756 .Fn Pmapping_iter_resolved ,
757 .Fn Pobject_iter ,
758 and
759 .Fn Pobject_iter_resolved
760 functions. It is defined as
761 .Sy typedef
762 .Ft int
763 .Fo proc_map_f
764 .Fa "void *"
765 .Fa "const prmap_t *"
766 .Fa "const char *"
767 .Fc .
768 The first argument is a pointer to an argument that the user specifies.
769 The second argument is describes the mapping information and is defined
770 in
771 .Xr proc 4 .
772 The final argument contains the name of the mapping or object file in
773 question. For additional information on using this type, see
774 .Xr Pmapping_iter 3PROC .
775 .Pp
776 .Sy proc_env_f
777 .Pp
778 The
779 .Sy proc_env_f
780 is a function pointer type that is used with the
781 .Fn Penv_iter
782 function. It is defined as
783 .Sy typedef

```

```

784 .Ft int
785 .Fo proc_env_f
786 .Fa "void *"
787 .Fa "struct ps_prochandle *"
788 .Fa "uintptr_t"
789 .Fa "const char *"
790 .Fc .
791 The first argument is a pointer to an argument that the user specifies.
792 The second argument is a pointer to the
793 .Sy struct ps_prochandle
794 that the callback was passed to. The third argument is the address of
795 the environment variable in the process. The fourth argument is the
796 environment variable. Values in the environment follow the convention of
797 the form
798 .Em variable=value .
799 For more information on environment variables see
800 .Xr exec 2
801 and
802 .Xr environ 5 .
803 For additional information on using this type, see
804 .Xr Penv_iter 3PROC .
805 .Pp
806 .Sy proc_sym_f
807 .Pp
808 The
809 .Sy proc_sym_f
810 is a function pointer type that is used with the
811 .Fn Psymbol_iter ,
812 .Fn Psymbol_iter_by_addr ,
813 .Fn Psymbol_iter_by_name ,
814 and
815 .Fn Psymbol_iter_by_lmid
816 functions. It is defined as
817 .Sy typedef
818 .Ft int
819 .Fo proc_sym_f
820 .Fa "void *"
821 .Fa "const GElf_Sym *"
822 .Fa "const char *"
823 .Fc .
824 The first argument is a pointer to an argument that the user supplies.
825 The second argument is a pointer to the ELF symbol information in a
826 32-bit and 64-bit neutral form. See
827 .Xr elf 3ELF
828 and
829 .Xr gelf 3ELF
830 for more information on it. The final argument points to a character
831 string that has the name of the symbol. For additional information on
832 using this type, see
833 .Xr Psymbol_iter 3PROC ,
834 .Xr Psymbol_iter_by_addr 3PROC ,
835 .Xr Psymbol_iter_by_name 3PROC ,
836 and
837 .Xr Psymbol_iter_by_lmid 3PROC .
838 .Pp
839 .Sy proc_xsym_f
840 .Pp
841 The
842 .Sy proc_xsym_f
843 is a function pointer type that is used with the
844 .Fn Pxsymbol_iter
845 function. It is defined as
846 .Sy typedef
847 .Ft int
848 .Fo proc_xsym_f
849 .Fa "void *"

```

```

850 .Fa "const GElf_Sym *"
851 .Fa "const char *"
852 .Fa "const prsyminfo_t *"
853 .Fc .
854 The first three arguments are identical to those of
855 .Sy proc_sym_f .
856 The final argument contains additional information about the symbol
857 itself. The members of the
858 .Sy prsyminfo_t
859 are defined earlier in this section. For additional information on using
860 this type, see
861 .Xr Pxsymbol_iter 3PROC .
862 .Pp
863 .Sy proc_stack_f
864 .Pp
865 The
866 .Sy proc_stack_f
867 is a function pointer type that is used with the
868 .Fn Pstack_iter
869 function. It is defined as
870 .Sy typedef
871 .Ft int
872 .Fo proc_stack_f
873 .Fa "void *"
874 .Fa "prgregset_t"
875 .Fa "uint_t"
876 .Fa "const long *"
877 .Fc .
878 The first argument is a pointer to an argument that the user specifies.
879 The second argument's contents are platform specific. The registers that
880 contain stack information, usually the stack pointer and frame pointer,
881 will be filled in to point to an entry. The
882 .Sy prgregset_t
883 is defined in
884 .Xr proc 4 .
885 .Pp
886 The third argument contains the number of arguments to the current stack
887 frame and the fourth argument contains an array of addresses that
888 correspond to the arguments to that stack function. The value of the
889 third argument dictates the number of entries in the fourth argument.
890 For additional information on using this type, see
891 .Xr Pstack_iter 3PROC .
892 .Pp
893 .Sy proc_fdinfo_f
894 .Pp
895 The
896 .Sy proc_fdinfo_f
897 is a function pointer type that is used with the
898 .Fn Pfdinfo_iter
899 function. It is defined as
900 .Sy typedef
901 .Ft int
902 .Fo proc_fdinfo_f
903 .Fa "void *"
904 .Fa "prfdinfo_t *"
905 .Fc .
906 The first argument is a pointer to an argument that the user specifies.
907 The second argument contains information about an open file descriptor.
908 The members of the
909 .Sy prfdinfo_t
910 are defined earlier in this section. For additional information on using
911 this type, see
912 .Xr Pfdinfo_iter 3PROC .
913 .Sh PROGRAMMING NOTES
914 When working with live processes, whether from the
915 .Xr Pgrab

```

```

916 or
917 .Xr Pcreate
918 family of functions, there are some additional considerations.
919 Importantly, if a process calls any of the
920 .Xr exec 2
921 suite of functions, much of the state information that is obtained,
922 particularly that about mappings in the process will be invalid. Callers
923 must ensure that they call
924 .Xr Preset_maps 3PROC
925 when they hold a process handle across an exec. In addition, users of
926 the library should familiarize themselves with the
927 .Sy PROGRAMMING NOTES
928 section of the
929 .Xr proc 4
930 manual page, which discusses issues of privileges and security.
931 .Sh DEBUGGING
932 The library provides a means for obtaining additional debugging
933 information. The output itself is not part of the
934 .Nm
935 library's stable interface. Setting the environment variable
936 .Ev LIBPROC_DEBUG
937 to some value will print information to standard error. For example,
938 .Ev LIBPROC_DEBUG Ns = Ns Em please .
939 .Sh LOCKING
940 Most functions operate on a handle to a process in the form of a
941 .Vt "struct ps_prochandle *" .
942 Unless otherwise indicated, the library does not provide any
943 synchronization for different routines that are operating on the
944 .Sy same
945 .Nm
946 library handle. It is up to the caller to ensure that only a single
947 thread is using a handle at any given time. Multiple threads may call
948 .Nm
949 library routines at the same time as long as each thread is using a
950 different handle.
951 .Pp
952 Each individual function notes its
953 .Sy MT-Level
954 section. The MT-Level of a routine that matches the above description
955 will refer to this manual page. If it does not, then it refers to the
956 standard attributes in
957 .Xr attributes 5 .
958 .Sh INTERFACE STABILITY
959 .Sy Uncommitted
960 .Pp
961 While the library is considered an uncommitted interface, and is still
962 evolving, changes that break compatibility have been uncommon and this
963 trend is expected to continue. It is documented to allow consumers,
964 whether part of illumos or outside of it, to understand the library and
965 make use of it with the understanding that changes may occur which break
966 both source and binary compatibility.

15 .Dt PSECFLAGS 3PROC
16 .Os
17 .Sh NAME
18 .Nm Psecflags ,
19 .Nm Psecflags_free
20 .Nd get and free process security flags
21 .Sh SYNOPSIS
22 .Lb libproc
23 .In libproc.h
24 .Ft int
25 .Fo Psecflags
26 .Fa "struct ps_prochandle *p"
27 .Fa "prsecflags_t **psf"
28 .Fc
29 .Ft void
30 .Fo Psecflags_free
31 .Fa "struct ps_prochandle *p"
32 .Fa "prsecflags_t *psf"
33 .Fc
34 .Sh DESCRIPTION
35 The
36 .Fn Psecflags
37 function obtains the security flags of the process handle
38 .Fa P .
39 The security flags structure will be dynamically allocated and a pointer to it
40 will be placed in
41 .Fa psf .
42 It must be released with a call to
43 .Fn Psecflags_free .
44 The definition of the
45 .Sy prsecflags_t
46 structure is documented in
47 .Xr proc 4 .
48 .Pp
49 The
50 .Fn Psecflags_free
51 function releases the storage in
52 .Fa psf
53 that was allocated as a result of calling
54 .Fn Psecflags .
55 .Sh RETURN VALUES
56 Upon successful completion, the
57 .Fn Psecflags

```

```

58 function returns
59 .Sy 0
60 and
61 .Fa psf
62 is updated with a pointer to the allocated security flags. Otherwise,
63 .Sy -1
64 is returned and
65 .Fa psf
66 is not updated.
67 .Sh INTERFACE STABILITY
68 .Sy Uncommitted
69 .Sh MT-LEVEL
70 See
71 .Sy LOCKING
72 in

9 .TH CORE 4 \"Jun 6, 2016\"
9 .TH CORE 4 \"Mar 31, 2013\"
10 .SH NAME
11 core \\- process core file
12 .SH DESCRIPTION
13 .sp
13 .LP
14 The operating system writes out a core file for a process when the process is
15 terminated due to receiving certain signals. A core file is a disk copy of the
16 contents of the process address space at the time the process received the
17 signal, along with additional information about the state of the process. This
18 information can be consumed by a debugger. Core files can also be generated by
19 applying the \\fbgcore\\fR(1) utility to a running process.
20 .sp
21 .LP
22 Typically, core files are produced following abnormal termination of a process
23 resulting from a bug in the corresponding application. Whatever the cause, the
24 core file itself provides invaluable information to the programmer or support
25 engineer to aid in diagnosing the problem. The core file can be inspected using
26 a debugger such as \\fbdbx\\fR(1) or \\fbmdb\\fR(1) or by applying one of the
27 \\fbproc\\fR(1) tools.
28 .sp
29 .LP
30 The operating system attempts to create up to two core files for each
31 abnormally terminating process, using a global core file name pattern and a
32 per-process core file name pattern. These patterns are expanded to determine
33 the pathname of the resulting core files, and can be configured by
34 \\fBcoreadm\\fR(1M). By default, the global core file pattern is disabled and not
35 used, and the per-process core file pattern is set to \\fBcore\\fR. Therefore, by
36 default, the operating system attempts to create a core file named \\fBcore\\fR
37 in the process's current working directory.
38 .sp
39 .LP
40 A process terminates and produces a core file whenever it receives one of the
41 signals whose default disposition is to cause a core dump. The list of signals
42 that result in generating a core file is shown in \\fBsignal.h\\fR(3HEAD).
43 Therefore, a process might not produce a core file if it has blocked or
44 modified the behavior of the corresponding signal. Additionally, no core dump
45 can be created under the following conditions:
46 .RS +4
47 .TP
48 .ie t \\(bu
49 .el o
50 If normal file and directory access permissions prevent the creation or
51 modification of the per-process core file pathname by the current process user
52 and group ID. This test does not apply to the global core file pathname
53 because, regardless of the UID of the process dumping core, the attempt to
54 write the global core file is made as the superuser.
55 .RE

```

```

56 .RS +4
57 .TP
58 .ie t \\(bu
59 .el o
60 Core files owned by the user \\fBnobody\\fR will not be produced. For example,
61 core files generated for the superuser on an NFS directory are owned by
62 \\fBnobody\\fR and are, therefore, not written.
63 .RE
64 .RS +4
65 .TP
66 .ie t \\(bu
67 .el o
68 If the core file pattern expands to a pathname that contains intermediate
69 directory components that do not exist. For example, if the global pattern is
70 set to \\fB/var/core/%n/core.%p\\fR, and no directory \\fB/var/core/'uname -n'\\fR
71 has been created, no global core files are produced.
72 .RE
73 .RS +4
74 .TP
75 .ie t \\(bu
76 .el o
77 If the destination directory is part of a filesystem that is mounted read-only.
78 .RE
79 .RS +4
80 .TP
81 .ie t \\(bu
82 .el o
83 If the resource limit \\fBRLIMIT_CORE\\fR has been set to \\fB0\\fR for the
84 process, no per-process core file is produced. Refer to \\fBsetrlimit\\fR(2) and
85 \\fBulimit\\fR(1) for more information on resource limits.
86 .RE
87 .RS +4
88 .TP
89 .ie t \\(bu
90 .el o
91 If the core file name already exists in the destination directory and is not a
92 regular file (that is, is a symlink, block or character special-file, and so
93 forth).
94 .RE
95 .RS +4
96 .TP
97 .ie t \\(bu
98 .el o
99 If the kernel cannot open the destination file \\fBEXCL\\fR, which can occur if
100 same file is being created by another process simultaneously.
101 .RE
102 .RS +4
103 .TP
104 .ie t \\(bu
105 .el o
106 If the process's effective user ID is different from its real user ID or if its
107 effective group ID is different from its real group ID. Similarly, set-user-ID
108 and set-group-ID programs do not produce core files as this could potentially
109 compromise system security. These processes can be explicitly granted
110 permission to produce core files using \\fBcoreadm\\fR(1M), at the risk of
111 exposing secure information.
112 .RE
113 .sp
114 .LP
115 The core file contains all the process information pertinent to debugging:
116 contents of hardware registers, process status, and process data. The format of
117 a core file is object file specific.
118 .sp
119 .LP
120 For ELF executable programs (see \\fBa.out\\fR(4)), the core file generated is
121 also an ELF file, containing ELF program and file headers. The \\fBe_type\\fR

```

122 field in the file header has type `\fBET_CORE`. The program header contains an
 123 entry for every segment that was part of the process address space, including
 124 shared library segments. The contents of the mappings specified by
 125 `\fBcoreadm` are also part of the core image. Each program header has its
 126 `\fBp_memsz` field set to the size of the mapping. The program headers that
 127 represent mappings whose data is included in the core file have their
 128 `\fBp_filesz` field set the same as `\fBp_memsz`, otherwise `\fBp_filesz` is
 129 `\fBzero`.
 130 .sp
 131 .LP
 132 A mapping's data can be excluded due to the core file content settings (see
 133 `\fBcoreadm`), due to a failure, or due to a signal received after
 134 core dump initiation but before its completion. If the data is excluded
 135 because of a failure, the program header entry will have the
 136 `\fBPF_SUNW_FAILURE` flag
 137 set in its `\fBp_flags` field; if the data is excluded because of a signal,
 138 the segment's `\fBp_flags` field will have the `\fBPF_SUNW_KILLED`
 139 flag set.
 140 .sp
 141 .LP
 142 The program headers of an `\fBELF` core file also contain entries for two
 143 `\fBNOTE` segments, each containing several note entries as described below.
 144 The note entry header and core file note type (`\fBn_type`) definitions are
 145 contained in `<\fBsys/elf.h>`. The first `\fBNOTE` segment exists for binary
 146 compatibility with old programs that deal with core files. It contains
 147 structures defined in `<\fBsys/old_procfs.h>`. New programs should recognize
 148 and skip this `\fBNOTE` segment, advancing instead to the new `\fBNOTE`
 149 segment. The old `\fBNOTE` segment is deleted from core files in a future
 150 release.
 151 .sp
 152 .LP
 153 The old `\fBNOTE` segment contains the following entries. Each has entry name
 154 `\fB"CORE"` and presents the contents of a system structure:
 155 .sp
 156 .ne 2
 157 .na
 158 `\fB\fBprpsinfo_t`
 159 .ad
 160 .RS 16n
 161 `\fBn_type`: `\fBNT_PRPSINFO`. This entry contains information of interest to
 162 the `\fBps` command, such as process status, `\fBCPU` usage, `\fBnice`
 163 value, controlling terminal, user-ID, process-ID, the name of the executable,
 164 and so forth. The `\fBprpsinfo_t` structure is defined in
 165 `<\fBsys/old_procfs.h>`.
 166 .RE
 168 .sp
 169 .ne 2
 170 .na
 171 `\fB\fBbchar` array
 172 .ad
 173 .RS 16n
 174 `\fBn_type`: `\fBNT_PLATFORM`. This entry contains a string describing the
 175 specific model of the hardware platform on which this core file was created.
 176 This information is the same as provided by `\fBsysinfo` when invoked with
 177 the command `\fBBI_PLATFORM`.
 178 .RE
 180 .sp
 181 .ne 2
 182 .na
 183 `\fB\fBauxv_t` array
 184 .ad
 185 .RS 16n
 186 `\fBn_type`: `\fBNT_AUXV`. This entry contains the array of `\fBauxv_t`
 187 structures that was passed by the operating system as startup information to

188 the dynamic linker. Auxiliary vector information is defined in
 189 `<\fBsys/auxv.h>`.
 190 .RE
 192 .sp
 193 .LP
 194 Following these entries, for each active (non-zombie) light-weight process
 195 (LWP) in the process, the old `\fBNOTE` segment contains an entry with a
 196 `\fBprstatus_t` structure, plus other optionally-present entries describing
 197 the LWP, as follows:
 198 .sp
 199 .ne 2
 200 .na
 201 `\fB\fBprstatus_t`
 202 .ad
 203 .RS 16n
 204 `\fBn_type`: `\fBNT_PRSTATUS`. This structure contains things of interest to
 205 a debugger from the operating system, such as the general registers, signal
 206 dispositions, state, reason for stopping, process-ID, and so forth. The
 207 `\fBprstatus_t` structure is defined in `<\fBsys/old_procfs.h>`.
 208 .RE
 210 .sp

8.TH PROC 4 "Jun 6, 2016"
9.TH PROC 4 "Mar 31, 2013"
10 .SH NAME
11 .SH DESCRIPTION
12 .sp
13 .LP
14 \fB/proc\fR is a file system that provides access to the state of each process
15 and light-weight process (lwp) in the system. The name of each entry in the
16 \fB/proc\fR directory is a decimal number corresponding to a process-ID. These
17 entries are themselves subdirectories. Access to process state is provided by
18 additional files contained within each subdirectory; the hierarchy is described
19 more completely below. In this document, ``\fB/proc\fR file'' refers to a
20 non-directory file within the hierarchy rooted at \fB/proc\fR. The owner of
21 each \fB/proc\fR file and subdirectory is determined by the user-ID of the
22 process.
23 .sp
24 .LP
25 \fB/proc\fR can be mounted on any mount point, in addition to the standard
26 \fB/proc\fR mount point, and can be mounted several places at once. Such
27 additional mounts are allowed in order to facilitate the confinement of
28 processes to subtrees of the file system via \fBchroot\fR(1M) and yet allow
29 such processes access to commands like \fBps\fR(1).
30 .sp
31 .LP
32 Standard system calls are used to access \fB/proc\fR files: \fBopen\fR(2),
33 \fBclose\fR(2), \fBread\fR(2), and \fBwrite\fR(2) (including \fBreadv\fR(2),
34 \fBwritev\fR(2), \fBpread\fR(2), and \fBpwrite\fR(2)). Most files describe
35 process state and can only be opened for reading. \fBctl\fR and \fBlwpctl\fR
36 (control) files permit manipulation of process state and can only be opened for
37 writing. \fBas\fR (address space) files contain the image of the running
38 process and can be opened for both reading and writing. An open for writing
39 allows process control; a read-only open allows inspection but not control. In
40 this document, we refer to the process as open for reading or writing if any of
41 its associated \fB/proc\fR files is open for reading or writing.
42 .sp
43 .LP
44 In general, more than one process can open the same \fB/proc\fR file at the
45 same time. \fBexclusive\fR \fBopen\fR is an advisory mechanism provided to
46 allow controlling processes to avoid collisions with each other. A process can
47 obtain exclusive control of a target process, with respect to other cooperating
48 processes, if it successfully opens any \fB/proc\fR file in the target process
49 for writing (the \fBas\fR or \fBctl\fR files, or the \fBlwpctl\fR file of any
50 lwp) while specifying \fB_EXCL\fR in the \fBopen\fR(2). Such an open will fail
51 if the target process is already open for writing (that is, if an \fBas\fR,
52 \fBctl\fR, or \fBlwpctl\fR file is already open for writing). There can be any
53 number of concurrent read-only opens; \fB_EXCL\fR is ignored on opens for
54 reading. It is recommended that the first open for writing by a controlling
55 process use the \fB_EXCL\fR flag; multiple controlling processes usually
56 result in chaos.

```

```

56 .sp
57 .LP
58 If a process opens one of its own \fB/proc\fR files for writing, the open
59 succeeds regardless of \fB_EXCL\fR and regardless of whether some other
60 process has the process open for writing. Self-opens do not count when another
61 process attempts an exclusive open. (A process cannot exclude a debugger by
62 opening itself for writing and the application of a debugger cannot prevent a
63 process from opening itself.) All self-opens for writing are forced to be
64 close-on-exec (see the \fB_SETFD\fR operation of \fBfcntl\fR(2)).
65 .sp
66 .LP
67 Data may be transferred from or to any locations in the address space of the
68 traced process by applying \fBlseek\fR(2) to position the \fBas\fR file at the
69 virtual address of interest followed by \fBread\fR(2) or \fBwrite\fR(2) (or by
70 using \fBpread\fR(2) or \fBpwrite\fR(2) for the combined operation). The
71 address-map files \fB/proc/\fR\fIpid\fR/\fBmap\fR and
72 \fB/proc/\fR\fIpid\fR/\fBxmap\fR can be read to determine the accessible areas
73 (mappings) of the address space. \fBIO\fR transfers may span contiguous
74 mappings. An \fBIO\fR request extending into an unmapped area is truncated at
75 the boundary. A write request beginning at an unmapped virtual address fails
76 with \fBEBIO\fR; a read request beginning at an unmapped virtual address returns
77 zero (an end-of-file indication).
78 .sp
79 .LP
80 Information and control operations are provided through additional files.
81 \fBprocfs.h\fR contains definitions of data structures and message formats
82 used with these files. Some of these definitions involve the use of sets of
83 flags. The set types \fBsigset_t\fR, \fBftset_t\fR, and \fBsysset_t\fR
84 correspond, respectively, to signal, fault, and system call enumerations
85 defined in \fB<sys/signal.h>\fR, \fB<sys/fault.h>\fR, and
86 \fB<sys/syscall.h>\fR. Each set type is large enough to hold flags for its
87 own enumeration. Although they are of different sizes, they have a common
88 structure and can be manipulated by these macros:
89 .sp
90 .in +2
91 .nf
92 prfillset(&set); /* turn on all flags in set */
93 premtypset(&set); /* turn off all flags in set */
94 praddset(&set, flag); /* turn on the specified flag */
95 prdelset(&set, flag); /* turn off the specified flag */
96 r = prismember(&set, flag); /* != 0 iff flag is turned on */
97 .fi
98 .in -2
100 .sp
101 .LP
102 One of \fBprfillset()\fR or \fBpremtypset()\fR must be used to initialize
103 \fBset\fR before it is used in any other operation. \fBflag\fR must be a member
104 of the enumeration corresponding to \fBset\fR.
105 .sp
106 .LP
107 Every process contains at least one \fBlight-weight process\fR, or \fBilwp\fR.
108 Each lwp represents a flow of execution that is independently scheduled by the
109 operating system. All lwps in a process share its address space as well as many
110 other attributes. Through the use of \fBlwpctl\fR and \fBctl\fR files as
111 described below, it is possible to affect individual lwps in a process or to
112 affect all of them at once, depending on the operation.
113 .sp
114 .LP
115 When the process has more than one lwp, a representative lwp is chosen by the
116 system for certain process status files and control operations. The
117 representative lwp is a stopped lwp only if all of the process's lwps are
118 stopped; is stopped on an event of interest only if all of the lwps are so
119 stopped (excluding \fBPR_SUSPENDED\fR lwps); is in a \fBPR_REQUESTED\fR stop
120 only if there are no other events of interest to be found; or, failing
121 everything else, is in a \fBPR_SUSPENDED\fR stop (implying that the process is

```

122 deadlocked). See the description of the `\fBstatus\fR` file for definitions of
 123 stopped states. See the `\fBPCSTOP\fR` control operation for the definition of
 124 'event of interest'.
 125 .sp
 126 .LP
 127 The representative lwp remains fixed (it will be chosen again on the next
 128 operation) as long as all of the lwps are stopped on events of interest or are
 129 in a `\fBPR_SUSPENDED\fR` stop and the `\fBPCRUN\fR` control operation is not
 130 applied to any of them.
 131 .sp
 132 .LP
 133 When applied to the process control file, every `\fB/proc\fR` control operation
 134 that must act on an lwp uses the same algorithm to choose which lwp to act
 135 upon. Together with synchronous stopping (see `\fBPCSET\fR`), this enables a
 136 debugger to control a multiple-lwp process using only the process-level status
 137 and control files if it so chooses. More fine-grained control can be achieved
 138 using the lwp-specific files.
 139 .sp
 140 .LP
 141 The system supports two process data models, the traditional 32-bit data model
 142 in which ints, longs and pointers are all 32 bits wide (the ILP32 data model),
 143 and on some platforms the 64-bit data model in which longs and pointers, but
 144 not ints, are 64 bits in width (the LP64 data model). In the LP64 data model
 145 some system data types, notably `\fBsize_t\fR`, `\fBoff_t\fR`, `\fBtime_t\fR` and
 146 `\fBdev_t\fR`, grow from 32 bits to 64 bits as well.
 147 .sp
 148 .LP
 149 The `\fB/proc\fR` interfaces described here are available to both 32-bit and
 150 64-bit controlling processes. However, many operations attempted by a 32-bit
 151 controlling process on a 64-bit target process will fail with `\fBEOVERFLOW\fR`
 152 because the address space range of a 32-bit process cannot encompass a 64-bit
 153 process or because the data in some 64-bit system data type cannot be
 154 compressed to fit into the corresponding 32-bit type without loss of
 155 information. Operations that fail in this circumstance include reading and
 156 writing the address space, reading the address-map files, and setting the
 157 target process's registers. There is no restriction on operations applied by a
 158 64-bit process to either a 32-bit or a 64-bit target processes.
 159 .sp
 160 .LP
 161 The format of the contents of any `\fB/proc\fR` file depends on the data model of
 162 the observer (the controlling process), not on the data model of the target
 163 process. A 64-bit debugger does not have to translate the information it reads
 164 from a `\fB/proc\fR` file for a 32-bit process from 32-bit format to 64-bit
 165 format. However, it usually has to be aware of the data model of the target
 166 process. The `\fBpr_dmodel\fR` field of the `\fBstatus\fR` files indicates the
 167 target process's data model.
 168 .sp
 169 .LP
 170 To help deal with system data structures that are read from 32-bit processes, a
 171 64-bit controlling program can be compiled with the C preprocessor symbol
 172 `\fB_SYSCALL32\fR` defined before system header files are included. This makes
 173 explicit 32-bit fixed-width data structures (like `\fBcstruct stat32\fR`) visible
 174 to the 64-bit program. See `\fBtypes32.h\fR(3HEAD)`.
 175 .SH DIRECTORY STRUCTURE
 176 .sp
 176 .LP
 177 At the top level, the directory `\fB/proc\fR` contains entries each of which
 178 names an existing process in the system. These entries are themselves
 179 directories. Except where otherwise noted, the files described below can be
 180 opened for reading only. In addition, if a process becomes a `\fBzombie\fR` (one
 181 that has exited but whose parent has not yet performed a `\fBwait\fR(3C)` upon
 182 it), most of its associated `\fB/proc\fR` files disappear from the hierarchy;
 183 subsequent attempts to open them, or to read or write files opened before the
 184 process exited, will elicit the error `\fBENOENT\fR`.
 185 .sp
 186 .LP

187 Although process state and consequently the contents of `\fB/proc\fR` files can
 188 change from instant to instant, a single `\fBread\fR(2)` of a `\fB/proc\fR` file is
 189 guaranteed to return a sane representation of state; that is, the read will be
 190 atomic with respect to the state of the process. No such guarantee applies to
 191 successive reads applied to a `\fB/proc\fR` file for a running process. In
 192 addition, atomicity is not guaranteed for `\fBI/O\fR` applied to the `\fBas\fR`
 193 (address-space) file for a running process or for a process whose address space
 194 contains memory shared by another running process.
 195 .sp
 196 .LP
 197 A number of structure definitions are used to describe the files. These
 198 structures may grow by the addition of elements at the end in future releases
 199 of the system and it is not legitimate for a program to assume that they will
 200 not.
 201 .SH STRUCTURE OF `\fB/proc\fR`
 202 .sp
 202 .LP
 203 A given directory `\fB/proc/\fR` contains the following entries. A
 204 process can use the invisible alias `\fB/proc/self\fR` if it wishes to open one
 205 of its own `\fB/proc\fR` files (invisible in the sense that the name 'self'
 206 does not appear in a directory listing of `\fB/proc\fR` obtained from
 207 `\fBls\fR(1)`, `\fBgetdents\fR(2)`, or `\fBreaddir\fR(3C)`).
 208 .SS "contracts"
 209 .sp
 210 .LP
 210 A directory containing references to the contracts held by the process. Each
 211 entry is a symlink to the contract's directory under `\fB/system/contract\fR`.
 212 See `\fBcontract\fR(4)`.
 213 .SS "as"
 214 .sp
 214 .LP
 215 Contains the address-space image of the process; it can be opened for both
 216 reading and writing. `\fBlseek\fR(2)` is used to position the file at the virtual
 217 address of interest and then the address space can be examined or changed
 218 through `\fBread\fR(2)` or `\fBwrite\fR(2)` (or by using `\fBpread\fR(2)` or
 219 `\fBpwrite\fR(2)` for the combined operation).
 220 .SS "ctl"
 221 .sp
 221 .LP
 222 A write-only file to which structured messages are written directing the system
 223 to change some aspect of the process's state or control its behavior in some
 224 way. The seek offset is not relevant when writing to this file. Individual lwps
 225 also have associated `\fBlwpcctl\fR` files in the lwp subdirectories. A control
 226 message may be written either to the process's `\fBctl\fR` file or to a specific
 227 `\fBlwpcctl\fR` file with operation-specific effects. The effect of a control
 228 message is immediately reflected in the state of the process visible through
 229 appropriate status and information files. The types of control messages are
 230 described in detail later. See `\fBCONTROL MESSAGES\fR`.
 231 .SS "status"
 232 .sp
 232 .LP
 233 Contains state information about the process and the representative lwp. The
 234 file contains a `\fBpstatus\fR` structure which contains an embedded
 235 `\fBlwpstatus\fR` structure for the representative lwp, as follows:
 236 .sp
 237 .in +2
 238 .nf
 239 typedef struct pstatus {
 240 int pr_flags; /* flags (see below) */
 241 int pr_nlwp; /* number of active lwps in the process */
 242 int pr_nzomb; /* number of zombie lwps in the process */
 243 pid_t pr_pid; /* process id */
 244 pid_t pr_ppid; /* parent process id */
 245 pid_t pr_pgid; /* process group id */
 246 pid_t pr_sid; /* session id */
 247 id_t pr_aslwpid; /* obsolete */

```

248     id_t pr_agentid;      /* lwp-id of the agent lwp, if any */
249     sigset_t pr_sigpend; /* set of process pending signals */
250     uintptr_t pr_brkbase; /* virtual address of the process heap */
251     size_t pr_brksize;    /* size of the process heap, in bytes */
252     uintptr_t pr_stkbase; /* virtual address of the process stack */
253     size_t pr_stksize;    /* size of the process stack, in bytes */
254     timestruc_t pr_utime; /* process user cpu time */
255     timestruc_t pr_stime; /* process system cpu time */
256     timestruc_t pr_cutime; /* sum of children's user times */
257     timestruc_t pr_cstime; /* sum of children's system times */
258     sigset_t pr_sigtrace; /* set of traced signals */
259     fltset_t pr_fltrace;  /* set of traced faults */
260     sysset_t pr_sysentry; /* set of system calls traced on entry */
261     sysset_t pr_sysexit; /* set of system calls traced on exit */
262     char pr_dmodel;      /* data model of the process */
263     taskid_t pr_taskid; /* task id */
264     projid_t pr_projid; /* project id */
265     zoneid_t pr_zoneid; /* zone id */
266     lwpstatus_t pr_lwp; /* status of the representative lwp */
267 } pstatus_t;

```

unchanged portion omitted

```

493 .fi
494 .in -2

496 .sp
497 .LP
498 \fBpr_flags\fR is a bit-mask holding the following lwp flags. For convenience,
499 it also contains the process flags, described previously.
500 .sp
501 .ne 2
502 .na
503 \fB\fbpr_stopped\fR
504 .ad
505 .RS 14n
506 The lwp is stopped.
507 .RE

509 .sp
510 .ne 2
511 .na
512 \fB\fbpr_istop\fR
513 .ad
514 .RS 14n
515 The lwp is stopped on an event of interest (see \fBpcstop\fR).
516 .RE

518 .sp
519 .ne 2
520 .na
521 \fB\fbpr_dstop\fR
522 .ad
523 .RS 14n
524 The lwp has a stop directive in effect (see \fBpcstop\fR).
525 .RE

527 .sp
528 .ne 2
529 .na
530 \fB\fbpr_step\fR
531 .ad
532 .RS 14n
533 The lwp has a single-step directive in effect (see \fBpcrun\fR).
534 .RE

536 .sp
537 .ne 2

```

```

538 .na
539 \fB\fbpr_asleep\fR
540 .ad
541 .RS 14n
542 The lwp is in an interruptible sleep within a system call.
543 .RE

545 .sp
546 .ne 2
547 .na
548 \fB\fbpr_pcINVAL\fR
549 .ad
550 .RS 14n
551 The lwp's current instruction (\fBpr_instr\fR) is undefined.
552 .RE

554 .sp
555 .ne 2
556 .na
557 \fB\fbpr_detach\fR
558 .ad
559 .RS 14n
560 This is a detached lwp (see \fBpthread_create\fR(3C) and
561 \fBpthread_join\fR(3C)).
562 .RE

564 .sp
565 .ne 2
566 .na
567 \fB\fbpr_daemon\fR
568 .ad
569 .RS 14n
570 This is a daemon lwp (see \fBpthread_create\fR(3C)).
571 .RE

573 .sp
574 .ne 2
575 .na
576 \fB\fbpr_aslwp\fR
577 .ad
578 .RS 14n
579 This flag is obsolete and is never set.
580 .RE

582 .sp
583 .ne 2
584 .na
585 \fB\fbpr_agent\fR
586 .ad
587 .RS 14n
588 This is the \fB/proc\fR agent lwp for the process.
589 .RE

591 .sp
592 .LP
593 \fBpr_lwpid\fR names the specific lwp.
594 .sp
595 .LP
596 \fBpr_why\fR and \fBpr_what\fR together describe, for a stopped lwp, the reason
597 for the stop. Possible values of \fBpr_why\fR and the associated \fBpr_what\fR
598 are:
599 .sp
600 .ne 2
601 .na
602 \fB\fbpr_requested\fR
603 .ad

```

```

604 .RS 17n
605 indicates that the stop occurred in response to a stop directive, normally
606 because \fBPCSTOP\fR was applied or because another lwp stopped on an event of
607 interest and the asynchronous-stop flag (see \fBPCSET\fR) was not set for the
608 process. \fBpr_what\fR is unused in this case.
609 .RE

611 .sp
612 .ne 2
613 .na
614 \fB\fBPR_SIGNALED\fR\fR
615 .ad
616 .RS 17n
617 indicates that the lwp stopped on receipt of a signal (see \fBPCSTRACE\fR);
618 \fBpr_what\fR holds the signal number that caused the stop (for a newly-stopped
619 lwp, the same value is in \fBpr_cursig\fR).
620 .RE

622 .sp
623 .ne 2
624 .na
625 \fB\fBPR_FAULTED\fR\fR
626 .ad
627 .RS 17n
628 indicates that the lwp stopped on incurring a hardware fault (see
629 \fBPCSFault\fR); \fBpr_what\fR holds the fault number that caused the stop.
630 .RE

632 .sp
633 .ne 2
634 .na
635 \fB\fBPR_SYSENTRY\fR\fR
636 .ad
637 .br
638 .na
639 \fB\fBPR_SYSEXIT\fR\fR
640 .ad
641 .RS 17n
642 indicate a stop on entry to or exit from a system call (see \fBPCSENTRY\fR and
643 \fBPCSEXIT\fR); \fBpr_what\fR holds the system call number.
644 .RE

646 .sp
647 .ne 2
648 .na
649 \fB\fBPR_JOBCONTROL\fR\fR
650 .ad
651 .RS 17n
652 indicates that the lwp stopped due to the default action of a job control stop
653 signal (see \fBsigaction\fR(2)); \fBpr_what\fR holds the stopping signal
654 number.
655 .RE

657 .sp
658 .ne 2
659 .na
660 \fB\fBPR_SUSPENDED\fR\fR
661 .ad
662 .RS 17n
663 indicates that the lwp stopped due to internal synchronization of lwps within
664 the process. \fBpr_what\fR is unused in this case.
665 .RE

667 .sp
668 .LP
669 \fBpr_cursig\fR names the current signal, that is, the next signal to be

```

```

670 delivered to the lwp, if any. \fBpr_info\fR, when the lwp is in a
671 \fBPR_SIGNALED\fR or \fBPR_FAULTED\fR stop, contains additional information
672 pertinent to the particular signal or fault (see \fB<sys/signinfo.h>\fR).
673 .sp
674 .LP
675 \fBpr_lwppend\fR identifies any synchronous or directed signals pending for the
676 lwp. \fBpr_lwphold\fR identifies those signals whose delivery is being blocked
677 by the lwp (the signal mask).
678 .sp
679 .LP
680 \fBpr_action\fR contains the signal action information pertaining to the
681 current signal (see \fBsigaction\fR(2)); it is undefined if \fBpr_cursig\fR is
682 zero. \fBpr_altstack\fR contains the alternate signal stack information for the
683 lwp (see \fBsigaltstack\fR(2)).
684 .sp
685 .LP
686 \fBpr_oldcontext\fR, if not zero, contains the address on the lwp stack of a
687 \fBpr_ucontext\fR structure describing the previous user-level context (see
688 \fBpr_ucontext.h\fR(3HEAD)). It is non-zero only if the lwp is executing in the
689 context of a signal handler.
690 .sp
691 .LP
692 \fBpr_syscall\fR is the number of the system call, if any, being executed by
693 the lwp; it is non-zero if and only if the lwp is stopped on \fBPR_SYSENTRY\fR
694 or \fBPR_SYSEXIT\fR, or is asleep within a system call ( \fBPR_ASLEEP\fR is
695 set). If \fBpr_syscall\fR is non-zero, \fBpr_nsysarg\fR is the number of
696 arguments to the system call and \fBpr_sysarg\fR contains the actual arguments.
697 .sp
698 .LP
699 \fBpr_rvall\fR, \fBpr_rval2\fR, and \fBpr_errno\fR are defined only if the lwp
700 is stopped on \fBPR_SYSEXIT\fR or if the \fBPR_VFORKP\fR flag is set. If
701 \fBpr_errno\fR is zero, \fBpr_rvall\fR and \fBpr_rval2\fR contain the return
702 values from the system call. Otherwise, \fBpr_errno\fR contains the error
703 number for the failing system call (see \fB<sys/errno.h>\fR).
704 .sp
705 .LP
706 \fBpr_clname\fR contains the name of the lwp's scheduling class.
707 .sp
708 .LP
709 \fBpr_tstamp\fR, if the lwp is stopped, contains a time stamp marking when the
710 lwp stopped, in real time seconds and nanoseconds since an arbitrary time in
711 the past.
712 .sp
713 .LP
714 \fBpr_utime\fR is the amount of user level CPU time used by this LWP.
715 .sp
716 .LP
717 \fBpr_stime\fR is the amount of system level CPU time used by this LWP.
718 .sp
719 .LP
720 \fBpr_ustack\fR is the virtual address of the \fBpr_stack_t\fR that contains the
721 stack boundaries for this LWP. See \fBpr_getustack\fR(2) and
722 \fBpr_stack_grow\fR(3C).
723 .sp
724 .LP
725 \fBpr_instr\fR contains the machine instruction to which the lwp's program
726 counter refers. The amount of data retrieved from the process is
727 machine-dependent. On SPARC based machines, it is a 32-bit word. On x86-based
728 machines, it is a single byte. In general, the size is that of the machine's
729 smallest instruction. If \fBPR_PCINVAL\fR is set, \fBpr_instr\fR is undefined;
730 this occurs whenever the lwp is not stopped or when the program counter refers
731 to an invalid virtual address.
732 .sp
733 .LP
734 \fBpr_reg\fR is an array holding the contents of a stopped lwp's general
735 registers.

```

```

736 .sp
737 .ne 2
738 .na
739 \fBSPARC\fR
740 .ad
741 .RS 2ln
742 On SPARC-based machines, the predefined constants \fBR_G0\fR ... \fBR_G7\fR,
743 \fBR_O0\fR ... \fBR_O7\fR, \fBR_L0\fR ... \fBR_L7\fR, \fBR_I0\fR ...
744 \fBR_I7\fR, \fBR_PC\fR, \fBR_nPC\fR, and \fBR_Y\fR can be used as indices to
745 refer to the corresponding registers; previous register windows can be read
746 from their overflow locations on the stack (however, see the \fBgwindows\fR
747 file in the \fB/proc/\fR\fIpid\fR/\fB/lwp/\fR\fIlwpid\fR subdirectory).
748 .RE

750 .sp
751 .ne 2
752 .na
753 \fBSPARC V8 (32-bit)\fR
754 .ad
755 .RS 2ln
756 For SPARC V8 (32-bit) controlling processes, the predefined constants
757 \fBR_PSR\fR, \fBR_WIM\fR, and \fBR_TBR\fR can be used as indices to refer to
758 the corresponding special registers. For SPARC V9 (64-bit) controlling
759 processes, the predefined constants \fBR_CCR\fR, \fBR_ASI\fR, and \fBR_FPRS\fR
760 can be used as indices to refer to the corresponding special registers.
761 .RE

763 .sp
764 .ne 2
765 .na
766 \fBx86 (32-bit)\fR
767 .ad
768 .RS 2ln
769 For 32-bit x86 processes, the predefined constants listed below can be used as
770 indices to refer to the corresponding registers.

847 .LP
848 \fBpr_fpreg\fR is a structure holding the contents of the floating-point
849 registers.
850 .sp
851 .LP
852 SPARC registers, both general and floating-point, as seen by a 64-bit
853 controlling process are the V9 versions of the registers, even if the target
854 process is a 32-bit (V8) process. V8 registers are a subset of the V9
855 registers.
856 .sp
857 .LP
858 If the lwp is not stopped, all register values are undefined.
859 .SS "psinfo"
860 .LP
861 Contains miscellaneous information about the process and the representative lwp
862 needed by the \fBps(1)\fR command. \fBpsinfo\fR remains accessible after a
863 process becomes a \fBzombie\fR. The file contains a \fBpsinfo\fR structure
864 which contains an embedded \fBlwpsinfo\fR structure for the representative lwp,
865 as follows:
866 .sp

```

```

867 .in +2
868 .nf
869 typedef struct psinfo {
870     int pr_flag; /* process flags (DEPRECATED: see below) */
871     int pr_nlwp; /* number of active lwps in the process */

956 .in -2

958 .sp
959 .LP
960 Some of the entries in \fBlwpsinfo\fR, such as \fBpr_addr\fR, \fBpr_wchan\fR,
961 \fBpr_stype\fR, \fBpr_state\fR, and \fBpr_name\fR, refer to internal kernel
962 data structures and should not be expected to retain their meanings across
963 different versions of the operating system.
964 .sp
965 .LP
966 \fBlwpsinfo_t.pr_flag\fR is a deprecated interface that should no longer be
967 used.
968 .sp
969 .LP
970 \fBpr_pctcpu\fR is a 16-bit binary fraction, as described above. It represents
971 the \fBpr_pctcpu\fR time used by the specific lwp. On a multi-processor machine, the
972 maximum value is 1/N, where N is the number of \fBpr_cpu\fRs.
973 .sp
974 .LP
975 \fBpr_contract\fR is the id of the process contract of which the process is a
976 member. See \fBpr_contract\fR(4) and \fBpr_process\fR(4).
977 .SS "cred"
978 .sp
979 Contains a description of the credentials associated with the process:
980 .sp
981 .in +2

```

```

982 .nf
983 typedef struct prcred {
984     uid_t pr_euid; /* effective user id */
985     uid_t pr_ruid; /* real user id */
986     uid_t pr_suid; /* saved user id (from exec) */
987     gid_t pr_egid; /* effective group id */
988     gid_t pr_rgid; /* real group id */
989     gid_t pr_sgid; /* saved group id (from exec) */
990     int pr_ngroups; /* number of supplementary groups */
991     gid_t pr_groups[1]; /* array of supplementary groups */
992 } prcred_t;
993 .fi
994 .in -2
995 .sp

997 .sp
998 .LP
999 The array of associated supplementary groups in \fBpr_groups\fR is of variable
1000 length; the \fBpr_cred\fR file contains all of the supplementary groups.
1001 \fBpr_ngroups\fR indicates the number of supplementary groups. (See also the
1002 \fBpr_cred\fR and \fBpr_credx\fR control operations.)
1003 .SS "priv"
1004 .sp
1005 Contains a description of the privileges associated with the process:
1006 .sp
1007 .in +2
1008 .nf
1009 typedef struct prpriv {
1010     uint32_t pr_nsets; /* number of privilege set */
1011     uint32_t pr_setsize; /* size of privilege set */
1012     uint32_t pr_infosize; /* size of supplementary data */
1013     priv_chunk_t pr_sets[1]; /* array of sets */
1014 } prpriv_t;
1015 .fi
1016 .in -2

1018 .sp
1019 .LP
1020 The actual dimension of the \fBpr_sets\fR[] field is
1021 .sp
1022 .in +2
1023 .nf
1024 pr_sets[pr_nsets][pr_setsize]
1025 .fi
1026 .in -2

1028 .sp
1029 .LP
1030 which is followed by additional information about the process state
1031 \fBpr_infosize\fR bytes in size.
1032 .sp
1033 .LP
1034 The full size of the structure can be computed using
1035 \fBPRIV_PRIV_SIZE\fR(\fBprpriv_t *\fR).
1036 .SS "secflags"
1037 .LP
1038 This file contains the security-flags of the process. It contains a
1039 description of the security flags associated with the process.
1040 .sp
1041 .in +2
1042 .nf
1043 typedef struct prsecflags {
1044     uint32_t pr_version; /* ABI Versioning of this structure */
1045     secflagset_t pr_effective; /* Effective flags */
1046     secflagset_t pr_inherit; /* Inheritable flags */

```

```

1047     secflagset_t pr_lower;      /* Lower flags */
1048     secflagset_t pr_upper;      /* Upper flags */
1049 } prsecflags_t;
1050 .in -2

1052 .sp
1053 .LP
1054 The \fBpr_version\fR field is a version number for the structure, currently
1055 \fBPRSECFLAGS_VERSION_1\fR.
1056 #endif /* ! codereview */
1057 .SS "sigact"
1058 .sp
1059 Contains an array of \fBsigaction\fR structures describing the current
1060 dispositions of all signals associated with the traced process (see
1061 \fBsigaction\fR(2)). Signal numbers are displaced by 1 from array indices, so
1062 that the action for signal number \fIn\fR appears in position \fIn-1 of the
1063 array.
1064 .SS "auxv"
1065 .sp
1066 Contains the initial values of the process's aux vector in an array of
1067 \fBauxv_t\fR structures (see \fB<sys/auxv.h>\fR). The values are those that
1068 were passed by the operating system as startup information to the dynamic
1069 linker.
1070 .SS "ldt"
1071 .sp
1072 This file exists only on x86-based machines. It is non-empty only if the
1073 process has established a local descriptor table (\fBLDT\fR). If non-empty, the
1074 file contains the array of currently active \fBLDT\fR entries in an array of
1075 elements of type \fBstruct ssd\fR, defined in \fB<sys/sysi86.h>\fR, one element
1076 for each active \fBLDT\fR entry.
1077 .SS "map, xmap"
1078 .sp
1079 Contain information about the virtual address map of the process. The map file
1080 contains an array of \fBprmap\fR structures while the xmap file contains an
1081 array of \fBprxmap\fR structures. Each structure describes a contiguous virtual
1082 address region in the address space of the traced process:
1083 .sp
1084 .in +2
1085 .nf
1086 typedef struct prmap {
1087     uintptr_t pr_vaddr;      /* virtual address of mapping */
1088     size_t pr_size;         /* size of mapping in bytes */
1089     char pr_mapname[PRMAPSZ]; /* name in /proc/pid/object */
1090     off_t pr_offset;        /* offset into mapped object, if any */
1091     int pr_mflags;          /* protection and attribute flags */
1092     int pr_pagesize;        /* pagesize for this mapping in bytes */
1093     int pr_shmid;           /* SysV shared memory identifier */
1094 } prmap_t;
1095 unchanged portion omitted
1117 .fi
1118 .in -2
1119 .sp

1121 .sp
1122 .LP
1123 \fBpr_vaddr\fR is the virtual address of the mapping within the traced process
1124 and \fBpr_size\fR is its size in bytes. \fBpr_mapname\fR, if it does not
1125 contain a null string, contains the name of a file in the \fBobject\fR
1126 directory (see below) that can be opened read-only to obtain a file descriptor
1127 for the mapped file associated with the mapping. This enables a debugger to
1128 find object file symbol tables without having to know the real path names of
1129 the executable file and shared libraries of the process. \fBpr_offset\fR is the

```

```

1130 64-bit offset within the mapped file (if any) to which the virtual address is
1131 mapped.
1132 .sp
1133 .LP
1134 \fBpr_mflags\fR is a bit-mask of protection and attribute flags:

1191 .na
1192 \fBFBMA_SHM\fR
1193 .ad
1194 .RS 17n
1195 mapping System V shared memory

```

1196 .RE

1198 .sp
 1199 .LP
 1200 A contiguous area of the address space having the same underlying mapped object
 1201 may appear as multiple mappings due to varying read, write, and execute
 1202 attributes. The underlying mapped object does not change over the range of a
 1203 single mapping. An `\fBI/O\fR` operation to a mapping marked `\fBMA_SHARED\fR`
 1204 fails if applied at a virtual address not corresponding to a valid page in the
 1205 underlying mapped object. A write to a `\fBMA_SHARED\fR` mapping that is not
 1206 marked `\fBMA_WRITE\fR` fails. Reads and writes to private mappings always
 1207 succeed. Reads and writes to unmapped addresses fail.

1208 .sp
 1209 .LP
 1210 `\fBpr_pagesize\fR` is the page size for the mapping, currently always the system
 1211 `pagesize`.

1212 .sp
 1213 .LP
 1214 `\fBpr_shmid\fR` is the shared memory identifier, if any, for the mapping. Its
 1215 value is `\fB\mi1\fR` if the mapping is not System V shared memory. See
 1216 `\fBshmget\fR(2)`.

1217 .sp
 1218 .LP
 1219 `\fBpr_dev\fR` is the device of the mapped object, if any, for the mapping. Its
 1220 value is `\fBPRNODEV\fR (-1)` if the mapping does not have a device.

1221 .sp
 1222 .LP
 1223 `\fBpr_ino\fR` is the inode of the mapped object, if any, for the mapping. Its
 1224 contents are only valid if `\fBpr_dev\fR` is not `\fBPRNODEV`.

1225 .sp
 1226 .LP
 1227 `\fBpr_rss\fR` is the number of resident pages of memory for the mapping. The
 1228 number of resident bytes for the mapping may be determined by multiplying
 1229 `\fBpr_rss\fR` by the page size given by `\fBpr_pagesize`.

1230 .sp
 1231 .LP
 1232 `\fBpr_anon\fR` is the number of resident anonymous memory pages (pages which are
 1233 private to this process) for the mapping.

1234 .sp
 1235 .LP
 1236 `\fBpr_locked\fR` is the number of locked pages for the mapping. Pages which are
 1237 locked are always resident in memory.

1238 .sp
 1239 .LP
 1240 `\fBpr_hatpagesize\fR` is the size, in bytes, of the `\fBHAT` (`\fBMMU`)
 1241 translation for the mapping. `\fBpr_hatpagesize` may be different than
 1242 `\fBpr_pagesize`. The possible values are hardware architecture specific, and
 1243 may change over a mapping's lifetime.

1244 .SS "rmap"
 1237 .sp
 1245 .LP
 1246 Contains information about the reserved address ranges of the process. The file
 1247 contains an array of `\fBprmap` structures, as defined above for the `\fBmap`
 1248 file. Each structure describes a contiguous virtual address region in the
 1249 address space of the traced process that is reserved by the system in the sense
 1250 that an `\fBmmap(2)` system call that does not specify `\fBMAP_FIXED` will
 1251 not use any part of it for the new mapping. Examples of such reservations
 1252 include the address ranges reserved for the process stack and the individual
 1253 thread stacks of a multi-threaded process.

1254 .SS "cwd"
 1248 .sp
 1255 .LP
 1256 A symbolic link to the process's current working directory. See `\fBchdir`(2).
 1257 A `\fBreadlink`(2) of `\fB/proc/\fIpid\fR/cwd` yields a null string. However,
 1258 it can be opened, listed, and searched as a directory, and can be the target of
 1259 `\fBchdir`(2).

1260 .SS "root"
 1255 .sp
 1261 .LP
 1262 A symbolic link to the process's root directory.
 1263 `\fB/proc/\fIpid\fR/\fB/root` can differ from the system root directory if
 1264 the process or one of its ancestors executed `\fBchroot`(2) as super user. It
 1265 has the same semantics as `\fB/proc/\fR/\fIpid\fR/\fB/cwd`.

1266 .SS "fd"
 1262 .sp
 1267 .LP
 1268 A directory containing references to the open files of the process. Each entry
 1269 is a decimal number corresponding to an open file descriptor in the process.

1270 .sp
 1271 .LP
 1272 If an entry refers to a regular file, it can be opened with normal file system
 1273 semantics but, to ensure that the controlling process cannot gain greater
 1274 access than the controlled process, with no file access modes other than its
 1275 read/write open modes in the controlled process. If an entry refers to a
 1276 directory, it can be accessed with the same semantics as
 1277 `\fB/proc/\fIpid\fR/cwd`. An attempt to open any other type of entry fails

1278 with `\fBEACCESS`.

1279 .SS "object"
 1276 .sp
 1280 .LP
 1281 A directory containing read-only files with names corresponding to the
 1282 `\fBpr_mapname` entries in the `\fBmap` and `\fBpagedata` files. Opening
 1283 such a file yields a file descriptor for the underlying mapped file associated
 1284 with an address-space mapping in the process. The file name `\fBa.out` appears
 1285 in the directory as an alias for the process's executable file.

1286 .sp
 1287 .LP
 1288 The `\fBobject` directory makes it possible for a controlling process to gain
 1289 access to the object file and any shared libraries (and consequently the symbol
 1290 tables) without having to know the actual path names of the executable files.

1291 .SS "path"
 1289 .sp
 1292 .LP
 1293 A directory containing symbolic links to files opened by the process. The
 1294 directory includes one entry for `\fBcwd` and `\fBroot`. The directory also
 1295 contains a numerical entry for each file descriptor in the `\fBfd` directory,
 1296 and entries matching those in the `\fBobject` directory. If this information
 1297 is not available, any attempt to read the contents of the symbolic link will
 1298 fail. This is most common for files that do not exist in the filesystem
 1299 namespace (such as `\fBFIFO`s and sockets), but can also happen for regular
 1300 files. For the file descriptor entries, the path may be different from the one
 1301 used by the process to open the file.

1302 .SS "pagedata"
 1301 .sp
 1303 .LP
 1304 Opening the page data file enables tracking of address space references and
 1305 modifications on a per-page basis.

1306 .sp
 1307 .LP
 1308 A `\fBread`(2) of the page data file descriptor returns structured page data
 1309 and atomically clears the page data maintained for the file by the system. That
 1310 is to say, each read returns data collected since the last read; the first read
 1311 returns data collected since the file was opened. When the call completes, the
 1312 read buffer contains the following structure as its header and thereafter
 1313 contains a number of section header structures and associated byte arrays that
 1314 must be accessed by walking linearly through the buffer.

1315 .sp
 1316 .in +2
 1317 .nf
 1318 typedef struct prpageheader {
 1319 timestruc_t pr_tstamp; /* real time stamp, time of read() */
 1320 ulong_t pr_nmap; /* number of address space mappings */

```

1321     ulong_t pr_npage;      /* total number of pages */
1322 } prpageheader_t;
unchanged portion omitted
1342 .fi
1343 .in -2

1345 .sp
1346 .LP
1347 Each section header is followed by \fBpr_npage\fR bytes, one byte for each page
1348 in the mapping, plus 0-7 null bytes at the end so that the next \fBprasmmap\fR
1349 structure begins on an eight-byte aligned boundary. Each data byte may contain
1350 these flags:
1351 .sp
1352 .ne 2
1353 .na
1354 \fB\FBPG_REFERENCED\fR
1355 .ad
1356 .RS 17n
1357 page has been referenced.
1358 .RE

1360 .sp
1361 .ne 2
1362 .na
1363 \fB\FBPG_MODIFIED\fR
1364 .ad
1365 .RS 17n
1366 page has been modified.
1367 .RE

1369 .sp
1370 .LP
1371 If the read buffer is not large enough to contain all of the page data, the
1372 read fails with \fBE2BIG\fR and the page data is not cleared. The required size
1373 of the read buffer can be determined through \fBfstat(2)\fR. Application of
1374 \fBlseek(2)\fR to the page data file descriptor is ineffective; every read
1375 starts from the beginning of the file. Closing the page data file descriptor
1376 terminates the system overhead associated with collecting the data.
1377 .sp
1378 .LP
1379 More than one page data file descriptor for the same process can be opened, up
1380 to a system-imposed limit per traced process. A read of one does not affect the
1381 data being collected by the system for the others. An open of the page data
1382 file will fail with \fBENOMEM\fR if the system-imposed limit would be exceeded.
1383 .SS "watch"
1384 .sp
1385 .LP
1385 Contains an array of \fBprwatch\fR structures, one for each watched area
1386 established by the \fBPCWATCH\fR control operation. See \fBPCWATCH\fR for
1387 details.
1388 .SS "usage"
1389 .sp
1390 .LP
1390 Contains process usage information described by a \fBprusage\fR structure which
1391 contains at least the following fields:
1392 .sp
1393 .in +2
1394 .nf
1395 typedef struct prusage {
1396     id_t pr_lwpid;          /* lwp id. 0: process or defunct */
1397     int pr_count;          /* number of contributing lwps */
1398     timestruc_t pr_tstamp; /* real time stamp, time of read() */
1399     timestruc_t pr_create; /* process/lwp creation time stamp */
1400     timestruc_t pr_term;   /* process/lwp termination time stamp */
1401     timestruc_t pr_rtime;  /* total lwp real (elapsed) time */
1402     timestruc_t pr_utime;  /* user level CPU time */

```

```

1403     timestruc_t pr_stime; /* system call CPU time */
1404     timestruc_t pr_ttime; /* other system trap CPU time */
1405     timestruc_t pr_tftime; /* text page fault sleep time */
1406     timestruc_t pr_dftime; /* data page fault sleep time */
1407     timestruc_t pr_kftime; /* kernel page fault sleep time */
1408     timestruc_t pr_ltime; /* user lock wait sleep time */
1409     timestruc_t pr_slptime; /* all other sleep time */
1410     timestruc_t pr_wtime; /* wait-cpu (latency) time */
1411     timestruc_t pr_stoptime; /* stopped time */
1412     ulong_t pr_minf; /* minor page faults */
1413     ulong_t pr_majf; /* major page faults */
1414     ulong_t pr_nswap; /* swaps */
1415     ulong_t pr_inblk; /* input blocks */
1416     ulong_t pr_oublk; /* output blocks */
1417     ulong_t pr_msnd; /* messages sent */
1418     ulong_t pr_mrcv; /* messages received */
1419     ulong_t pr_sigs; /* signals received */
1420     ulong_t pr_vctx; /* voluntary context switches */
1421     ulong_t pr_ictx; /* involuntary context switches */
1422     ulong_t pr_sysc; /* system calls */
1423     ulong_t pr_ioch; /* chars read and written */
1424 } prusage_t;
1425 .fi
1426 .in -2

1428 .sp
1429 .LP
1430 Microstate accounting is now continuously enabled. While this information was
1431 previously an estimate, if microstate accounting were not enabled, the current
1432 information is now never an estimate represents time the process has spent in
1433 various states.
1434 .SS "lstatus"
1436 .sp
1437 .LP
1436 Contains a \fBprheader\fR structure followed by an array of \fBBlwpstatus\fR
1437 structures, one for each active lwp in the process (see also
1438 \fB/proc/\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR, below). The
1439 \fBprheader\fR structure describes the number and size of the array entries
1440 that follow.
1441 .sp
1442 .in +2
1443 .nf
1444 typedef struct prheader {
1445     long pr_nent; /* number of entries */
1446     size_t pr_entsize; /* size of each entry, in bytes */
1447 } prheader_t;
1448 .fi
1449 .in -2

1451 .sp
1452 .LP
1453 The \fBBlwpstatus\fR structure may grow by the addition of elements at the end
1454 in future releases of the system. Programs must use \fBpr_entsize\fR in the
1455 file header to index through the array. These comments apply to all \fB/proc/\fR
1456 files that include a \fBprheader\fR structure (\fBBlpinfo\fR and \fBBlusage\fR,
1457 below).
1458 .SS "lpinfo"
1461 .sp
1462 .LP
1460 Contains a \fBprheader\fR structure followed by an array of \fBBlpinfo\fR
1461 structures, one for each active and zombie lwp in the process. See also
1462 \fB/proc/\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR\fR, below.
1463 .SS "lusage"
1467 .sp
1468 .LP
1465 Contains a \fBprheader\fR structure followed by an array of \fBprusage\fR

```

1466 structures, one for each active lwp in the process, plus an additional element
 1467 at the beginning that contains the summation over all defunct lwps (lwps that
 1468 once existed but no longer exist in the process). Excluding the `\fbpr_lwpid\fr`,
 1469 `\fbpr_tstamp\fr`, `\fbpr_create\fr`, and `\fbpr_term\fr` entries, the entry-by-entry
 1470 summation over all these structures is the definition of the process usage
 1471 information obtained from the `\fbusage\fr` file. (See also
 1472 `\fb/proc/\fr\lwpid\fr\fb/lwp/\fr\lwpid\fr/\fbusage\fr`, below.)
 1473 .SS "lwp"
 1474 .sp
 1474 .LP
 1475 A directory containing entries each of which names an active or zombie lwp
 1476 within the process. These entries are themselves directories containing
 1477 additional files as described below. Only the `\fblwpsinfo\fr` file exists in the
 1478 directory of a zombie lwp.
 1479 .SH STRUCTURE OF `\fb/proc/\fr\lwpid\fr\fb/lwp/\fr\lwpid\fr`
 1485 .sp
 1480 .LP
 1481 A given directory `\fb/proc/\fr\lwpid\fr\fb/lwp/\fr\lwpid\fr` contains the
 1482 following entries:
 1483 .SS "lwpctl"
 1490 .sp
 1484 .LP
 1485 Write-only control file. The messages written to this file affect the specific
 1486 lwp rather than the representative lwp, as is the case for the process's
 1487 `\fbctl\fr` file.
 1488 .SS "lwpstatus"
 1496 .sp
 1489 .LP
 1490 lwp-specific state information. This file contains the `\fbwlpstatus\fr`
 1491 structure for the specific lwp as described above for the representative lwp in
 1492 the process's `\fbstatus\fr` file.
 1493 .SS "lwpsinfo"
 1502 .sp
 1494 .LP
 1495 lwp-specific `\fbps\fr(1)` information. This file contains the `\fblwpsinfo\fr`
 1496 structure for the specific lwp as described above for the representative lwp in
 1497 the process's `\fbpsinfo\fr` file. The `\fblwpsinfo\fr` file remains accessible
 1498 after an lwp becomes a zombie.
 1499 .SS "lwpusage"
 1509 .sp
 1500 .LP
 1501 This file contains the `\fbprusage\fr` structure for the specific lwp as
 1502 described above for the process's `\fbusage\fr` file.
 1503 .SS "gwindows"
 1514 .sp
 1504 .LP
 1505 This file exists only on SPARC based machines. If it is non-empty, it contains
 1506 a `\fbgwindows_t\fr` structure, defined in `\fb<sys/regset.h>\fr`, with the values
 1507 of those SPARC register windows that could not be stored on the stack when the
 1508 lwp stopped. Conditions under which register windows are not stored on the
 1509 stack are: the stack pointer refers to nonexistent process memory or the stack
 1510 pointer is improperly aligned. If the lwp is not stopped or if there are no
 1511 register windows that could not be stored on the stack, the file is empty (the
 1512 usual case).
 1513 .SS "xregs"
 1525 .sp
 1514 .LP
 1515 Extra state registers. The extra state register set is architecture dependent;
 1516 this file is empty if the system does not support extra state registers. If the
 1517 file is non-empty, it contains an architecture dependent structure of type
 1518 `\fbprxregset_t\fr`, defined in `\fb<procfs.h>\fr`, with the values of the lwp's
 1519 extra state registers. If the lwp is not stopped, all register values are
 1520 undefined. See also the `\fbPCSXREG\fr` control operation, below.
 1521 .SS "asrs"
 1534 .sp
 1522 .LP

1523 This file exists only for 64-bit SPARC V9 processes. It contains an
 1524 `\fbasrset_t\fr` structure, defined in `<\fbsys/regset.h\fr>`, containing the
 1525 values of the lwp's platform-dependent ancillary state registers. If the lwp is
 1526 not stopped, all register values are undefined. See also the `\fbPCASRS\fr`
 1527 control operation, below.
 1528 .SS "spymaster"
 1542 .sp
 1529 .LP
 1530 For an agent lwp (see `\fbPCAGENT\fr`), this file contains a `\fbpsinfo_t\fr`
 1531 structure that corresponds to the process that created the agent lwp at the
 1532 time the agent was created. This structure is identical to that retrieved via
 1533 the `\fbpsinfo\fr` file, with one modification: the `\fbpr_time\fr` field does not
 1534 correspond to the CPU time for the process, but rather to the creation time of
 1535 the agent lwp.
 1536 .SS "templates"
 1551 .sp
 1537 .LP
 1538 A directory which contains references to the active templates for the lwp,
 1539 named by the contract type. Changes made to an active template descriptor do
 1540 not affect the original template which was activated, though they do affect the
 1541 active template. It is not possible to activate an active template descriptor.
 1542 See `\fbcontract\fr(4)`.
 1543 .SH CONTROL MESSAGES
 1559 .sp
 1544 .LP
 1545 Process state changes are effected through messages written to a process's
 1546 `\fbctl\fr` file or to an individual lwp's `\fbwlpctl\fr` file. All control
 1547 messages consist of a `\fblong\fr` that names the specific operation followed by
 1548 additional data containing the operand, if any.
 1549 .sp
 1550 .LP
 1551 Multiple control messages may be combined in a single `\fbwrite\fr(2)` (or
 1552 `\fbwritev\fr(2)`) to a control file, but no partial writes are permitted. That
 1553 is, each control message, operation code plus operand, if any, must be
 1554 presented in its entirety to the `\fbwrite\fr(2)` and not in pieces over several
 1555 system calls. If a control operation fails, no subsequent operations contained
 1556 in the same `\fbwrite\fr(2)` are attempted.
 1557 .sp
 1558 .LP
 1559 Descriptions of the allowable control messages follow. In all cases, writing a
 1560 message to a control file for a process or lwp that has terminated elicits the
 1561 error `\fbENOENT\fr`.
 1562 .SS "PCSTOP PCDSTOP PCWSTOP PCTWSTOP"
 1579 .sp
 1563 .LP
 1564 When applied to the process control file, `\fbPCSTOP\fr` directs all lwps to stop
 1565 and waits for them to stop, `\fbPCDSTOP\fr` directs all lwps to stop without
 1566 waiting for them to stop, and `\fbPCWSTOP\fr` simply waits for all lwps to stop.
 1567 When applied to an lwp control file, `\fbPCSTOP\fr` directs the specific lwp to
 1568 stop and waits until it has stopped, `\fbPCDSTOP\fr` directs the specific lwp to
 1569 stop without waiting for it to stop, and `\fbPCWSTOP\fr` simply waits for the
 1570 specific lwp to stop. When applied to an lwp control file, `\fbPCSTOP\fr` and
 1571 `\fbPCWSTOP\fr` complete when the lwp stops on an event of interest, immediately
 1572 if already so stopped; when applied to the process control file, they complete
 1573 when every lwp has stopped either on an event of interest or on a
 1574 `\fbPR_SUSPENDE\fr` stop.
 1575 .sp
 1576 .LP
 1577 `\fbPCTWSTOP\fr` is identical to `\fbPCWSTOP\fr` except that it enables the
 1578 operation to time out, to avoid waiting forever for a process or lwp that may
 1579 never stop on an event of interest. `\fbPCTWSTOP\fr` takes a `\fblong\fr` operand
 1580 specifying a number of milliseconds; the wait will terminate successfully after
 1581 the specified number of milliseconds even if the process or lwp has not
 1582 stopped; a timeout value of zero makes the operation identical to
 1583 `\fbPCWSTOP\fr`.
 1584 .sp

1585 .LP
 1586 An ``event of interest'' is either a \fBPR_REQUESTED\fR stop or a stop that has
 1587 been specified in the process's tracing flags (set by \fBPCSTRACE\fR,
 1588 \fBPCSFault\fR, \fBPCSENTRY\fR, and \fBPCSEXIT\fR). \fBPR_JOBCONTROL\fR and
 1589 \fBPR_SUSPENDED\fR stops are specifically not events of interest. (An lwp may
 1590 stop twice due to a stop signal, first showing \fBPR_SIGNALED\fR if the signal
 1591 is traced and again showing \fBPR_JOBCONTROL\fR if the lwp is set running
 1592 without clearing the signal.) If \fBPCSTOP\fR or \fBPCDSTOP\fR is applied to an
 1593 lwp that is stopped, but not on an event of interest, the stop directive takes
 1594 effect when the lwp is restarted by the competing mechanism. At that time, the
 1595 lwp enters a \fBPR_REQUESTED\fR stop before executing any user-level code.
 1596 .sp
 1597 .LP
 1598 A write of a control message that blocks is interruptible by a signal so that,
 1599 for example, an \fBalarm\fR(2) can be set to avoid waiting forever for a
 1600 process or lwp that may never stop on an event of interest. If \fBPCSTOP\fR is
 1601 interrupted, the lwp stop directives remain in effect even though the
 1602 \fBwrite\fR(2) returns an error. (Use of \fBPCWSTOP\fR with a non-zero timeout
 1603 is recommended over \fBPCWSTOP\fR with an \fBalarm\fR(2).)
 1604 .sp
 1605 .LP
 1606 A system process (indicated by the \fBPR_ISSYS\fR flag) never executes at user
 1607 level, has no user-level address space visible through \fB/proc\fR, and cannot
 1608 be stopped. Applying one of these operations to a system process or any of its
 1609 lwps elicits the error \fBBEBUSY\fR.
 1610 .SS "PCRUN"
 1628 .sp
 1611 .LP
 1612 Make an lwp runnable again after a stop. This operation takes a \fBlong\fR
 1613 operand containing zero or more of the following flags:
 1614 .sp
 1615 .ne 2
 1616 .na
 1617 \fB\fBPRCSIG\fR
 1618 .ad
 1619 .RS 12n
 1620 clears the current signal, if any (see \fBPCCSIG\fR).
 1621 .RE
 1623 .sp
 1624 .ne 2
 1625 .na
 1626 \fB\fBPRCFault\fR
 1627 .ad
 1628 .RS 12n
 1629 clears the current fault, if any (see \fBPCCFault\fR).
 1630 .RE
 1632 .sp
 1633 .ne 2
 1634 .na
 1635 \fB\fBPRSTEP\fR
 1636 .ad
 1637 .RS 12n
 1638 directs the lwp to execute a single machine instruction. On completion of the
 1639 instruction, a trace trap occurs. If \fBFLTRACE\fR is being traced, the lwp
 1640 stops; otherwise, it is sent \fBSIGTRAP\fR. If \fBSIGTRAP\fR is being traced
 1641 and is not blocked, the lwp stops. When the lwp stops on an event of interest,
 1642 the single-step directive is cancelled, even if the stop occurs before the
 1643 instruction is executed. This operation requires hardware and operating system
 1644 support and may not be implemented on all processors. It is implemented on
 1645 SPARC and x86-based machines.
 1646 .RE
 1648 .sp
 1649 .ne 2

1650 .na
 1651 \fB\fBPRSAORT\fR
 1652 .ad
 1653 .RS 12n
 1654 is meaningful only if the lwp is in a \fBPR_SYSENTRY\fR stop or is marked
 1655 \fBPR_ASLEEP\fR; it instructs the lwp to abort execution of the system call
 1656 (see \fBPCSENTRY\fR and \fBPCSEXIT\fR).
 1657 .RE
 1659 .sp
 1660 .ne 2
 1661 .na
 1662 \fB\fBPRSTOP\fR
 1663 .ad
 1664 .RS 12n
 1665 directs the lwp to stop again as soon as possible after resuming execution (see
 1666 \fBPCDSTOP\fR). In particular, if the lwp is stopped on \fBPR_SIGNALED\fR or
 1667 \fBPR_FAULTED\fR, the next stop will show \fBPR_REQUESTED\fR, no other stop
 1668 will have intervened, and the lwp will not have executed any user-level code.
 1669 .RE
 1671 .sp
 1672 .LP
 1673 When applied to an lwp control file, \fBPCRUN\fR clears any outstanding
 1674 directed-stop request and makes the specific lwp runnable. The operation fails
 1675 with \fBBEBUSY\fR if the specific lwp is not stopped on an event of interest or
 1676 has not been directed to stop or if the agent lwp exists and this is not the
 1677 agent lwp (see \fBPCAGENT\fR).
 1678 .sp
 1679 .LP
 1680 When applied to the process control file, a representative lwp is chosen for
 1681 the operation as described for \fB/proc\fR\fR\fR\fR\fR\fR\fR/status\fR. The
 1682 operation fails with \fBBEBUSY\fR if the representative lwp is not stopped on an
 1683 event of interest or has not been directed to stop or if the agent lwp exists.
 1684 If \fBPRSTEP\fR or \fBPRSTOP\fR was requested, the representative lwp is made
 1685 runnable and its outstanding directed-stop request is cleared; otherwise all
 1686 outstanding directed-stop requests are cleared and, if it was stopped on an
 1687 event of interest, the representative lwp is marked \fBPR_REQUESTED\fR. If, as
 1688 a consequence, all lwps are in the \fBPR_REQUESTED\fR or \fBPR_SUSPENDED\fR
 1689 stop state, all lwps showing \fBPR_REQUESTED\fR are made runnable.
 1690 .SS "PCSTRACE"
 1709 .sp
 1691 .LP
 1692 Define a set of signals to be traced in the process. The receipt of one of
 1693 these signals by an lwp causes the lwp to stop. The set of signals is defined
 1694 using an operand \fBsigset_t\fR contained in the control message. Receipt of
 1695 \fBSIGKILL\fR cannot be traced; if specified, it is silently ignored.
 1696 .sp
 1697 .LP
 1698 If a signal that is included in an lwp's held signal set (the signal mask) is
 1699 sent to the lwp, the signal is not received and does not cause a stop until it
 1700 is removed from the held signal set, either by the lwp itself or by setting the
 1701 held signal set with \fBPCSHOLD\fR.
 1702 .SS "PCCSIG"
 1722 .sp
 1703 .LP
 1704 The current signal, if any, is cleared from the specific or representative lwp.
 1705 .SS "PCCSIG"
 1726 .sp
 1706 .LP
 1707 The current signal and its associated signal information for the specific or
 1708 representative lwp are set according to the contents of the operand
 1709 \fBsiginfo_t\fR structure (see \fB<sys/signinfo.h>\fR). If the specified signal
 1710 number is zero, the current signal is cleared. The semantics of this operation
 1711 are different from those of \fBkill\fR(2) in that the signal is delivered to
 1712 the lwp immediately after execution is resumed (even if it is being blocked)

```

1713 and an additional \fBPR_SIGNALED\fR stop does not intervene even if the signal
1714 is traced. Setting the current signal to \fBSIGKILL\fR terminates the process
1715 immediately.
1716 .SS "PCKILL"
1738 .sp
1717 .LP
1718 If applied to the process control file, a signal is sent to the process with
1719 semantics identical to those of \fBkill\fR(2). If applied to an lwp control
1720 file, a directed signal is sent to the specific lwp. The signal is named in a
1721 \fBlong\fR operand contained in the message. Sending \fBSIGKILL\fR terminates
1722 the process immediately.
1723 .SS "PCUNKILL"
1746 .sp
1724 .LP
1725 A signal is deleted, that is, it is removed from the set of pending signals. If
1726 applied to the process control file, the signal is deleted from the process's
1727 pending signals. If applied to an lwp control file, the signal is deleted from
1728 the lwp's pending signals. The current signal (if any) is unaffected. The
1729 signal is named in a \fBlong\fR operand in the control message. It is an error
1730 (\fBEINVAL\fR) to attempt to delete \fBSIGKILL\fR.
1731 .SS "PCSHOLD"
1755 .sp
1732 .LP
1733 Set the set of held signals for the specific or representative lwp (signals
1734 whose delivery will be blocked if sent to the lwp). The set of signals is
1735 specified with a \fBsigset_t\fR operand. \fBSIGKILL\fR and \fBSIGSTOP\fR cannot
1736 be held; if specified, they are silently ignored.
1737 .SS "PCSAULT"
1762 .sp
1738 .LP
1739 Define a set of hardware faults to be traced in the process. On incurring one
1740 of these faults, an lwp stops. The set is defined via the operand
1741 \fBfltset_t\fR structure. Fault names are defined in \fB<sys/fault.h>\fR and
1742 include the following. Some of these may not occur on all processors; there may
1743 be processor-specific faults in addition to these.
1744 .sp

1847 .ad
1848 .RS 13n
1849 recoverable page fault
1850 .RE

1852 .sp
1853 .LP
1854 When not traced, a fault normally results in the posting of a signal to the lwp
1855 that incurred the fault. If an lwp stops on a fault, the signal is posted to
1856 the lwp when execution is resumed unless the fault is cleared by \fBPCCFault\fR
1857 or by the \fBPRCFault\fR option of \fBPCRUN\fR. \fBFLTPAGE\fR is an exception;
1858 no signal is posted. The \fBpr_info\fR field in the \fBBlwpstatus\fR structure
1859 identifies the signal to be sent and contains machine-specific information
1860 about the fault.
1861 .SS "PCCFAULT"
1862 .LP
1863 The current fault, if any, is cleared; the associated signal will not be sent
1864 to the specific or representative lwp.
1865 .SS "PCSENTRY PCSEXIT"
1866 .LP
1867 These control operations instruct the process's lwps to stop on entry to or
1868 exit from specified system calls. The set of system calls to be traced is
1869 defined via an operand \fBsysset_t\fR structure.
1870 .sp
1871 .LP
1872 When entry to a system call is being traced, an lwp stops after having begun
1873 the call to the system but before the system call arguments have been fetched
1874 from the lwp. When exit from a system call is being traced, an lwp stops on
1875 completion of the system call just prior to checking for signals and returning
1876 to user level. At this point, all return values have been stored into the lwp's
1877 registers.
1878 .sp
1879 .LP
1880 If an lwp is stopped on entry to a system call (\fBPR_SysENTRY\fR) or when
1881 sleeping in an interruptible system call (\fBPR_ASLEEP\fR is set), it may be
1882 instructed to go directly to system call exit by specifying the \fBPR_ABORT\fR
1883 flag in a \fBPCRUN\fR control message. Unless exit from the system call is
1884 being traced, the lwp returns to user level showing \fBEINTR\fR.
1885 .SS "PCWATCH"
1886 .LP
1887 Set or clear a watched area in the controlled process from a \fBprwatch\fR
1888 structure operand:
1889 .sp
1890 .in +2
1891 .nf
1892 typedef struct prwatch {
1893     uintptr_t pr_vaddr; /* virtual address of watched area */
1894     size_t pr_size; /* size of watched area in bytes */
1895     int pr_wflags; /* watch type flags */
1896 } prwatch_t;
1897 .fi
1898 .in -2

1900 .sp
1901 .LP
1902 \fBpr_vaddr\fR specifies the virtual address of an area of memory to be watched
1903 in the controlled process. \fBpr_size\fR specifies the size of the area, in

```

```

1904 bytes. \fBpr_wflags\fR specifies the type of memory access to be monitored as a
1905 bit-mask of the following flags:
1906 .sp
1907 .ne 2
1908 .na
1909 \fBpr_BWA_READ\fR\fR
1910 .ad
1911 .RS 16n
1912 read access
1913 .RE

1919 .ad
1920 .RS 16n
1921 write access
1922 .RE

1924 .sp
1925 .ne 2
1926 .na
1927 \fBpr_BWA_EXEC\fR\fR
1928 .ad
1929 .RS 16n
1930 execution access
1931 .RE

1933 .sp
1934 .ne 2
1935 .na
1936 \fBpr_BWA_TRAPAFTR\fR\fR
1937 .ad
1938 .RS 16n
1939 trap after the instruction completes
1940 .RE

1942 .sp
1943 .LP
1944 If \fBpr_wflags\fR is non-empty, a watched area is established for the virtual
1945 address range specified by \fBpr_vaddr\fR and \fBpr_size\fR. If \fBpr_wflags\fR
1946 is empty, any previously-established watched area starting at the specified
1947 virtual address is cleared; \fBpr_size\fR is ignored.
1948 .sp
1949 .LP
1950 A watchpoint is triggered when an lwp in the traced process makes a memory
1951 reference that covers at least one byte of a watched area and the memory
1952 reference is as specified in \fBpr_wflags\fR. When an lwp triggers a
1953 watchpoint, it incurs a watchpoint trap. If \fBpr_BFLTWATCH\fR is being traced, the
1954 lwp stops; otherwise, it is sent a \fBBSIGTRAP\fR signal; if \fBBSIGTRAP\fR is
1955 being traced and is not blocked, the lwp stops.
1956 .sp
1957 .LP
1958 The watchpoint trap occurs before the instruction completes unless
1959 \fBpr_BWA_TRAPAFTR\fR was specified, in which case it occurs after the instruction
1960 completes. If it occurs before completion, the memory is not modified. If it
1961 occurs after completion, the memory is modified (if the access is a write
1962 access).
1963 .sp
1964 .LP
1965 Physical i/o is an exception for watchpoint traps. In this instance, there is
1966 no guarantee that memory before the watched area has already been modified (or
1967 in the case of \fBpr_BWA_TRAPAFTR\fR, that the memory following the watched area
1968 has not been modified) when the watchpoint trap occurs and the lwp stops.
1969 .sp

```

1970 .LP
 1971 \fBpr_info\fR in the \fBlwpstatus\fR structure contains information pertinent
 1972 to the watchpoint trap. In particular, the \fBsi_addr\fR field contains the
 1973 virtual address of the memory reference that triggered the watchpoint, and the
 1974 \fBsi_code\fR field contains one of \fBTRAP_RWATCH\fR, \fBTRAP_WWATCH\fR, or
 1975 \fBTRAP_XWATCH\fR, indicating read, write, or execute access, respectively. The
 1976 \fBsi_trapafter\fR field is zero unless \fBWA_TRAPAFTR\fR is in effect for
 1977 this watched area; non-zero indicates that the current instruction is not the
 1978 instruction that incurred the watchpoint trap. The \fBsi_pc\fR field contains
 1979 the virtual address of the instruction that incurred the trap.
 1980 .sp
 1981 .LP
 1982 A watchpoint trap may be triggered while executing a system call that makes
 1983 reference to the traced process's memory. The lwp that is executing the system
 1984 call incurs the watchpoint trap while still in the system call. If it stops as
 1985 a result, the \fBlwpstatus\fR structure contains the system call number and its
 1986 arguments. If the lwp does not stop, or if it is set running again without
 1987 clearing the signal or fault, the system call fails with \fBEFAULT\fR. If
 1988 \fBWA_TRAPAFTR\fR was specified, the memory reference will have completed and
 1989 the memory will have been modified (if the access was a write access) when the
 1990 watchpoint trap occurs.
 1991 .sp
 1992 .LP
 1993 If more than one of \fBWA_READ\fR, \fBWA_WRITE\fR, and \fBWA_EXEC\fR is
 1994 specified for a watched area, and a single instruction incurs more than one of
 1995 the specified types, only one is reported when the watchpoint trap occurs. The
 1996 precedence is \fBWA_EXEC\fR, \fBWA_READ\fR, \fBWA_WRITE\fR (\fBWA_EXEC\fR and
 1997 \fBWA_READ\fR take precedence over \fBWA_WRITE\fR), unless \fBWA_TRAPAFTR\fR
 1998 was specified, in which case it is \fBWA_WRITE\fR, \fBWA_READ\fR, \fBWA_EXEC\fR
 1999 (\fBWA_WRITE\fR takes precedence).
 2000 .sp
 2001 .LP
 2002 \fBPCWATCH\fR fails with \fBEINVAL\fR if an attempt is made to specify
 2003 overlapping watched areas or if \fBpr_wflags\fR contains flags other than those
 2004 specified above. It fails with \fBENOMEM\fR if an attempt is made to establish
 2005 more watched areas than the system can support (the system can support
 2006 thousands).
 2007 .sp
 2008 .LP
 2009 The child of a \fBvfork\fR(2) borrows the parent's address space. When a
 2010 \fBvfork\fR(2) is executed by a traced process, all watched areas established
 2011 for the parent are suspended until the child terminates or performs an
 2012 \fBexec\fR(2). Any watched areas established independently in the child are
 2013 cancelled when the parent resumes after the child's termination or
 2014 \fBexec\fR(2). \fBPCWATCH\fR fails with \fBEBUSY\fR if applied to the parent of
 2015 a \fBvfork\fR(2) before the child has terminated or performed an \fBexec\fR(2).
 2016 The \fBPR_VFORKP\fR flag is set in the \fBpstatus\fR structure for such a
 2017 parent process.
 2018 .sp
 2019 .LP
 2020 Certain accesses of the traced process's address space by the operating system
 2021 are immune to watchpoints. The initial construction of a signal stack frame
 2022 when a signal is delivered to an lwp will not trigger a watchpoint trap even if
 2023 the new frame covers watched areas of the stack. Once the signal handler is
 2024 entered, watchpoint traps occur normally. On SPARC based machines, register
 2025 window overflow and underflow will not trigger watchpoint traps, even if the
 2026 register window save areas cover watched areas of the stack.
 2027 .sp
 2028 .LP
 2029 Watched areas are not inherited by child processes, even if the traced
 2030 process's inherit-on-fork mode, \fBPR_FORK\fR, is set (see \fBPCSET\fR, below).
 2031 All watched areas are cancelled when the traced process performs a successful
 2032 \fBexec\fR(2).
 2033 .SS "PCSET PCUNSET"
 2062 .sp
 2034 .LP

2035 \fBPCSET\fR sets one or more modes of operation for the traced process.
 2036 \fBPCUNSET\fR unsets these modes. The modes to be set or unset are specified by
 2037 flags in an operand \fBlong\fR in the control message:
 2038 .sp
 2039 .ne 2
 2040 .na
 2041 \fBPR_FORK\fR
 2042 .ad
 2043 .RS 13n
 2044 (inherit-on-fork): When set, the process's tracing flags and its
 2045 inherit-on-fork mode are inherited by the child of a \fBfork\fR(2),
 2046 \fBfork1\fR(2), or \fBvfork\fR(2). When unset, child processes start with all
 2047 tracing flags cleared.
 2048 .RE
 2050 .sp
 2051 .ne 2
 2052 .na
 2053 \fBPR_RLC\fR
 2054 .ad
 2055 .RS 13n
 2056 (run-on-last-close): When set and the last writable \fB/proc\fR file descriptor
 2057 referring to the traced process or any of its lwps is closed, all of the
 2058 process's tracing flags and watched areas are cleared, any outstanding stop
 2059 directives are canceled, and if any lwps are stopped on events of interest,
 2060 they are set running as though \fBPCRUN\fR had been applied to them. When
 2061 unset, the process's tracing flags and watched areas are retained and lwps are
 2062 not set running on last close.
 2063 .RE
 2065 .sp
 2066 .ne 2
 2067 .na
 2068 \fBPR_KLC\fR
 2069 .ad
 2070 .RS 13n
 2071 (kill-on-last-close): When set and the last writable \fB/proc\fR file
 2072 descriptor referring to the traced process or any of its lwps is closed, the
 2073 process is terminated with \fBSIGKILL\fR.
 2074 .RE
 2076 .sp
 2077 .ne 2
 2078 .na
 2079 \fBPR_ASYNC\fR
 2080 .ad
 2081 .RS 13n
 2082 (asynchronous-stop): When set, a stop on an event of interest by one lwp does
 2083 not directly affect any other lwp in the process. When unset and an lwp stops
 2084 on an event of interest other than \fBPR_REQUESTED\fR, all other lwps in the
 2085 process are directed to stop.
 2086 .RE
 2088 .sp
 2089 .ne 2
 2090 .na
 2091 \fBPR_MSACCT\fR
 2092 .ad
 2093 .RS 13n
 2094 (microstate accounting): Microstate accounting is now continuously enabled.
 2095 This flag is deprecated and no longer has any effect upon microstate
 2096 accounting. Applications may toggle this flag; however, microstate accounting
 2097 will remain enabled regardless.
 2098 .RE
 2100 .sp

```

2101 .ne 2
2102 .na
2103 \fb\fbPR_MSFORK\fr\fr
2104 .ad
2105 .RS 13n
2106 (inherit microstate accounting): All processes now inherit microstate
2107 accounting, as it is continuously enabled. This flag has been deprecated and
2108 its use no longer has any effect upon the behavior of microstate accounting.
2109 .RE

2111 .sp
2112 .ne 2
2113 .na
2114 \fb\fbPR_BPTADJ\fr\fr
2115 .ad
2116 .RS 13n
2117 (breakpoint trap pc adjustment): On x86-based machines, a breakpoint trap
2118 leaves the program counter (the \fBEIP\fr) referring to the breakpointed
2119 instruction plus one byte. When \fbPR_BPTADJ\fr is set, the system will adjust
2120 the program counter back to the location of the breakpointed instruction when
2121 the lwp stops on a breakpoint. This flag has no effect on SPARC based machines,
2122 where breakpoint traps leave the program counter referring to the breakpointed
2123 instruction.
2124 .RE

2126 .sp
2127 .ne 2
2128 .na
2129 \fb\fbPR_PTRACE\fr\fr
2130 .ad
2131 .RS 13n
2132 (ptrace-compatibility): When set, a stop on an event of interest by the traced
2133 process is reported to the parent of the traced process by \fbwait\fr(3C),
2134 \fbSIGTRAP\fr is sent to the traced process when it executes a successful
2135 \fbexec\fr(2), setuid/setgid flags are not honored for execs performed by the
2136 traced process, any exec of an object file that the traced process cannot read
2137 fails, and the process dies when its parent dies. This mode is deprecated; it
2138 is provided only to allow \fbptrace\fr(3C) to be implemented as a library
2139 function using \fb/proc\fr.
2140 .RE

2142 .sp
2143 .LP
2144 It is an error (\fBEINVAL\fr) to specify flags other than those described above
2145 or to apply these operations to a system process. The current modes are
2146 reported in the \fbpr_flags\fr field of \fb/proc/\fr\flpid\fr\fb/status\fr and
2147 \fb/proc/\fr\flpid\fr\fb/lwp/\fr\flwp\fr\fb/lwpstatus\fr.
2148 .SS "PCSREG"
2149 .LP
2150 Set the general registers for the specific or representative lwp according to
2151 the operand \fbprgregset_t\fr structure.
2152 .sp
2153 .LP
2154 On SPARC based systems, only the condition-code bits of the processor-status
2155 register (R_PSR) of SPARC V8 (32-bit) processes can be modified by
2156 \fbPCSREG\fr. Other privileged registers cannot be modified at all.
2157 .sp
2158 .LP
2159 On x86-based systems, only certain bits of the flags register (EFL) can be
2160 modified by \fbPCSREG\fr: these include the condition codes, direction-bit, and
2161 overflow-bit.
2162 .sp
2163 .LP
2164 \fbPCSREG\fr fails with \fbEBUSY\fr if the lwp is not stopped on an event of
2165 interest.
```

```

2166 .SS "PCSVADDR"
2167 .sp
2168 .LP
2169 Set the address at which execution will resume for the specific or
2170 representative lwp from the operand \fblong\fr. On SPARC based systems, both
2171 %pc and %npc are set, with %npc set to the instruction following the virtual
2172 address. On x86-based systems, only %eip is set. \fbPCSVADDR\fr fails with
2173 \fbEBUSY\fr if the lwp is not stopped on an event of interest.
2174 .SS "PCSFPREG"
2175 .sp
2176 .LP
2177 Set the floating-point registers for the specific or representative lwp
2178 according to the operand \fbprfpregsset_t\fr structure. An error (\fBEINVAL\fr)
2179 is returned if the system does not support floating-point operations (no
2180 floating-point hardware and the system does not emulate floating-point machine
2181 instructions). \fbPCSFPREG\fr fails with \fbEBUSY\fr if the lwp is not stopped
2182 on an event of interest.
2183 .SS "PCSXREG"
2184 .sp
2185 .LP
2186 Set the extra state registers for the specific or representative lwp according
2187 to the architecture-dependent operand \fbprxregsset_t\fr structure. An error
2188 (\fBEINVAL\fr) is returned if the system does not support extra state
2189 registers. \fbPCSXREG\fr fails with \fbEBUSY\fr if the lwp is not stopped on an
2190 event of interest.
2191 .SS "PCSASRS"
2192 .sp
2193 .LP
2194 Set the ancillary state registers for the specific or representative lwp
2195 according to the SPARC V9 platform-dependent operand \fbasrset_t\fr structure.
2196 An error (\fBEINVAL\fr) is returned if either the target process or the
2197 controlling process is not a 64-bit SPARC V9 process. Most of the ancillary
2198 state registers are privileged registers that cannot be modified. Only those
2199 that can be modified are set; all others are silently ignored. \fbPCSASRS\fr
2200 fails with \fbEBUSY\fr if the lwp is not stopped on an event of interest.
2201 .SS "PCAGENT"
2202 .sp
2203 .LP
2204 Create an agent lwp in the controlled process with register values from the
2205 operand \fbprgregset_t\fr structure (see \fbPCSREG\fr, above). The agent lwp is
2206 created in the stopped state showing \fbPR_REQUESTED\fr and with its held
2207 signal set (the signal mask) having all signals except \fbSIGKILL\fr and
2208 \fbSIGSTOP\fr blocked.
2209 .sp
2210 .LP
2211 The \fbPCAGENT\fr operation fails with \fbEBUSY\fr unless the process is fully
2212 stopped via \fb/proc\fr, that is, unless all of the lwps in the process are
2213 stopped either on events of interest or on \fbPR_SUSPENDED\fr, or are stopped
2214 on \fbPR_JOBCONTROL\fr and have been directed to stop via \fbPCDSTOP\fr. It
2215 fails with \fbEBUSY\fr if an agent lwp already exists. It fails with
2216 \fbBENOMEM\fr if system resources for creating new lwps have been exhausted.
2217 .sp
2218 .LP
2219 Any \fbPCRUN\fr operation applied to the process control file or to the control
2220 file of an lwp other than the agent lwp fails with \fbEBUSY\fr as long as the
2221 agent lwp exists. The agent lwp must be caused to terminate by executing the
2222 \fbSYS_lwp_exit\fr system call trap before the process can be restarted.
2223 .sp
2224 .LP
2225 Once the agent lwp is created, its lwp-ID can be found by reading the process
2226 status file. To facilitate opening the agent lwp's control and status files,
2227 the directory name \fb/proc/\fr\flpid\fr\fb/lwp/agent\fr is accepted for
2228 lookup operations as an invisible alias for
2229 \fb/proc/\fr\flpid\fr\fb/lwp/\fr\flwpid\fr \fr \flwpid\fr being the lwp-ID of
2230 the agent lwp (invisible in the sense that the name 'agent' does not appear
2231 in a directory listing of \fb/proc/\fr\flpid\fr\fb/lwp\fr obtained from
```

```

2227 \fBlis\fR(1), \fBgetdents\fR(2), or \fBreaddir\fR(3C)).
2228 .sp
2229 .LP
2230 The purpose of the agent lwp is to perform operations in the controlled process
2231 on behalf of the controlling process: to gather information not directly
2232 available via \fB/proc\fR files, or in general to make the process change state
2233 in ways not directly available via \fB/proc\fR control operations. To make use
2234 of an agent lwp, the controlling process must be capable of making it execute
2235 system calls (specifically, the \fBSYS_lwp_exit\fR system call trap). The
2236 register values given to the agent lwp on creation are typically the registers
2237 of the representative lwp, so that the agent lwp can use its stack.
2238 .sp
2239 .LP
2240 If the controlling process neglects to force the agent lwp to execute the
2241 \fBSYS_lwp_exit\fR system call (due to either logic error or fatal failure on
2242 the part of the controlling process), the agent lwp will remain in the target
2243 process. For purposes of being able to debug these otherwise rogue agents,
2244 information as to the creator of the agent lwp is reflected in that lwp's
2245 \fBspymaster\fR file in \fB/proc\fR. Should the target process generate a core
2246 dump with the agent lwp in place, this information will be available via the
2247 \fBNT_SPYMASTER\fR note in the core file (see \fBcore\fR(4)).
2248 .sp
2249 .LP
2250 The agent lwp is not allowed to execute any variation of the \fBSYS_fork\fR or
2251 \fBSYS_exec\fR system call traps. Attempts to do so yield \fBENOTSUP\fR to the
2252 agent lwp.
2253 .sp
2254 .LP
2255 Symbolic constants for system call trap numbers like \fBSYS_lwp_exit\fR and
2256 \fBSYS_lwp_create\fR can be found in the header file <\fBsys/syscall.h\fR>.
2257 .SS "PCREAD PCWRITE"
2258 .sp
2259 .LP
2259 Read or write the target process's address space via a \fBpriovec\fR structure
2260 operand:
2261 .sp
2262 .in +2
2263 .nf
2264 typedef struct priovec {
2265     void *pio_base;      /* buffer in controlling process */
2266     size_t pio_len;     /* size of read/write request in bytes */
2267     off_t pio_offset;   /* virtual address in target process */
2268 } priovec_t;
2269 .fi
2270 .in -2

```

```

2272 .sp
2273 .LP
2274 These operations have the same effect as \fBpread\fR(2) and \fBpwrite\fR(2),
2275 respectively, of the target process's address space file. The difference is
2276 that more than one \fBPCREAD\fR or \fBPCWRITE\fR control operation can be
2277 written to the control file at once, and they can be interspersed with other
2278 control operations in a single write to the control file. This is useful, for
2279 example, when planting many breakpoint instructions in the process's address
2280 space, or when stepping over a breakpointed instruction. Unlike \fBpread\fR(2)
2281 and \fBpwrite\fR(2), no provision is made for partial reads or writes; if the
2282 operation cannot be performed completely, it fails with \fBEIO\fR.
2283 .SS "PCNICE"
2284 .sp
2285 .LP
2285 The traced process's \fBnice\fR(2) value is incremented by the amount in the
2286 operand \fBlong\fR. Only a process with the {\fBPRIV_PROC_PRIOCNTL\fR}
2287 privilege asserted in its effective set can better a process's priority in this
2288 way, but any user may lower the priority. This operation is not meaningful for
2289 all scheduling classes.
2290 .SS "PCSCRED"

```

```

2328 .sp
2329 .LP
2329 Set the target process credentials to the values contained in the
2329 \fBprcred_t\fR structure operand (see \fB/proc/\fR\fR\fR\fR\fR\fR\fR). The
2329 effective, real, and saved user-IDs and group-IDs of the target process are
2329 set. The target process's supplementary groups are not changed; the
2329 \fBprngroups\fR and \fBprgroups\fR members of the structure operand are
2329 ignored. Only the privileged processes can perform this operation; for all
2329 others it fails with \fBPERM\fR.
2329 .SS "PCSCREDD"
2338 .sp
2339 .LP
2339 Operates like \fBPCSCRED\fR but also sets the supplementary groups; the length
2339 of the data written with this control operation should be "sizeof
2339 (\fBprcred_t\fR) + sizeof (\fBgid_t\fR) * (#groups - 1)".
2340 .SS "PCSPRIV"
2344 .sp
2345 .LP
2345 Set the target process privilege to the values contained in the \fBprpriv_t\fR
2345 operand (see \fB/proc/pid/priv\fR). The effective, permitted, inheritable, and
2345 limit sets are all changed. Privilege flags can also be set. The process is
2345 made privilege aware unless it can relinquish privilege awareness. See
2345 \fBprivileges\fR(5).
2345 .sp
2346 .LP
2346 The limit set of the target process cannot be grown. The other privilege sets
2346 must be subsets of the intersection of the effective set of the calling process
2346 with the new limit set of the target process or subsets of the original values
2346 of the sets in the target process.
2347 .sp
2348 .LP
2348 If any of the above restrictions are not met, \fBPERM\fR is returned. If the
2348 structure written is improperly formatted, \fBINVAL\fR is returned.
2349 .SH PROGRAMMING NOTES
2352 .sp
2353 .LP
2353 For security reasons, except for the \fBpsinfo\fR, \fBusage\fR, \fBlpsinfo\fR,
2353 \fBlusage\fR, \fBlwpsinfo\fR, and \fBlwusage\fR files, which are
2353 world-readable, and except for privileged processes, an open of a \fB/proc/\fR
2353 file fails unless both the user-ID and group-ID of the caller match those of
2353 the traced process and the process's object file is readable by the caller. The
2353 effective set of the caller is a superset of both the inheritable and the
2353 permitted set of the target process. The limit set of the caller is a superset
2353 of the limit set of the target process. Except for the world-readable files
2353 just mentioned, files corresponding to setuid and setgid processes can be
2353 opened only by the appropriately privileged process.
2353 .sp
2354 .LP
2354 A process that is missing the basic privilege {\fBPRIV_PROC_INFO\fR} cannot see
2354 any processes under \fB/proc/\fR that it cannot send a signal to.
2355 .sp
2356 .LP
2356 A process that has {\fBPRIV_PROC_OWNER\fR} asserted in its effective set can
2356 open any file for reading. To manipulate or control a process, the controlling
2356 process must have at least as many privileges in its effective set as the
2356 target process has in its effective, inheritable, and permitted sets. The limit
2356 set of the controlling process must be a superset of the limit set of the
2356 target process. Additional restrictions apply if any of the uids of the target
2356 process are 0. See \fBprivileges\fR(5).
2356 .sp
2357 .LP
2357 Even if held by a privileged process, an open process or lwp file descriptor
2357 (other than file descriptors for the world-readable files) becomes invalid if
2357 the traced process performs an \fBexec\fR(2) of a setuid/setgid object file or
2357 an object file that the traced process cannot read. Any operation performed on
2357 an invalid file descriptor, except \fBclose\fR(2), fails with \fBEAGAIN\fR. In

```

2353 this situation, if any tracing flags are set and the process or any lwp file
 2354 descriptor is open for writing, the process will have been directed to stop and
 2355 its run-on-last-close flag will have been set (see \fBPCSET\fR). This enables a
 2356 controlling process (if it has permission) to reopen the \fB/proc\fR files to
 2357 get new valid file descriptors, close the invalid file descriptors, unset the
 2358 run-on-last-close flag (if desired), and proceed. Just closing the invalid file
 2359 descriptors causes the traced process to resume execution with all tracing
 2360 flags cleared. Any process not currently open for writing via \fB/proc\fR, but
 2361 that has left-over tracing flags from a previous open, and that executes a
 2362 setuid/setgid or unreadable object file, will not be stopped but will have all
 2363 its tracing flags cleared.

2364 .sp
 2365 .LP
 2366 To wait for one or more of a set of processes or lwps to stop or terminate,
 2367 \fB/proc\fR file descriptors (other than those obtained by opening the
 2368 \fB/cwd\fR or \fB/root\fR directories or by opening files in the \fB/fd\fR or
 2369 \fB/object\fR directories) can be used in a \fBpoll\fR(2) system call. When
 2370 requested and returned, either of the polling events \fBPOLLPRI\fR or
 2371 \fBPOLLWRNORM\fR indicates that the process or lwp stopped on an event of
 2372 interest. Although they cannot be requested, the polling events \fBPOLLHUP\fR,
 2373 \fBPOLLERR\fR, and \fBPOLLNVAL\fR may be returned. \fBPOLLHUP\fR indicates that
 2374 the process or lwp has terminated. \fBPOLLERR\fR indicates that the file
 2375 descriptor has become invalid. \fBPOLLNVAL\fR is returned immediately if
 2376 \fBPOLLPRI\fR or \fBPOLLWRNORM\fR is requested on a file descriptor referring
 2377 to a system process (see \fBPCSTOP\fR). The requested events may be empty to
 2378 wait simply for termination.

2838 .sp
2795 .LP
2796 Errors that can occur in addition to the errors normally associated with file
2797 system access:
2798 .sp
2799 .ne 2
2800 .na
2801 \fB\FBE2BIG\fR\fR
2802 .ad
2803 .RS 13n
2804 Data to be returned in a \fBread\fR(2) of the page data file exceeds the size
2805 of the read buffer provided by the caller.
2806 .RE

2808 .sp
2809 .ne 2
2810 .na

```

```

2811 \fB\FBEACCES\fR\fR
2812 .ad
2813 .RS 13n
2814 An attempt was made to examine a process that ran under a different uid than
2815 the controlling process and {\fBPRIV_PROC_OWNER\fR} was not asserted in the
2816 effective set.
2817 .RE

2819 .sp
2820 .ne 2
2821 .na
2822 \fB\FBEAGAIN\fR\fR
2823 .ad
2824 .RS 13n
2825 The traced process has performed a \fBexec\fR(2) of a setuid/setgid object
2826 file or of an object file that it cannot read; all further operations on the
2827 process or lwp file descriptor (except \fBclose\fR(2)) elicit this error.
2828 .RE

2830 .sp
2831 .ne 2
2832 .na
2833 \fB\FBEBUSY\fR\fR
2834 .ad
2835 .RS 13n
2836 \fBPCSTOP\fR, \fBPCDSTOP\fR, \fBPCWSTOP\fR, or \fBPCTWSTOP\fR was applied to a
2837 system process; an exclusive \fBopen\fR(2) was attempted on a \fB/proc\fR file
2838 for a process already open for writing; \fBPCRUN\fR, \fBPCREG\fR,
2839 \fBPCSVADDR\fR, \fBPCSFPPREG\fR, or \fBPCSXREG\fR was applied to a process or
2840 lwp not stopped on an event of interest; an attempt was made to mount
2841 \fB/proc\fR when it was already mounted; \fBPCAGENT\fR was applied to a process
2842 that was not fully stopped or that already had an agent lwp.
2843 .RE

2845 .sp
2846 .ne 2
2847 .na
2848 \fB\FBEINVAL\fR\fR
2849 .ad
2850 .RS 13n
2851 In general, this means that some invalid argument was supplied to a system
2852 call. A non-exhaustive list of conditions eliciting this error includes: a
2853 control message operation code is undefined; an out-of-range signal number was
2854 specified with \fBPCSSIG\fR, \fBPCCKILL\fR, or \fBPCUNKILL\fR; \fBSIGKILL\fR was
2855 specified with \fBPCUNKILL\fR; \fBPCSFPPREG\fR was applied on a system that does
2856 not support floating-point operations; \fBPCSXREG\fR was applied on a system
2857 that does not support extra state registers.
2858 .RE

2860 .sp
2861 .ne 2
2862 .na
2863 \fB\FBEINTR\fR\fR
2864 .ad
2865 .RS 13n
2866 A signal was received by the controlling process while waiting for the traced
2867 process or lwp to stop via \fBPCSTOP\fR, \fBPCWSTOP\fR, or \fBPCTWSTOP\fR.
2868 .RE

2870 .sp
2871 .ne 2
2872 .na
2873 \fB\FBEIO\fR\fR
2874 .ad
2875 .RS 13n
2876 A \fBwrite\fR(2) was attempted at an illegal address in the traced process.

```

2877 .RE

2879 .sp
 2880 .ne 2
 2881 .na
 2882 \fB\FBENOENT\fR\fR
 2883 .ad
 2884 .RS 13n
 2885 The traced process or lwp has terminated after being opened. The basic
 2886 privilege {\fBPRIV_PROC_INFO\fR} is not asserted in the effective set of the
 2887 calling process and the calling process cannot send a signal to the target
 2888 process.
 2889 .RE

2891 .sp
 2892 .ne 2
 2893 .na
 2894 \fB\FBENOMEM\fR\fR
 2895 .ad
 2896 .RS 13n
 2897 The system-imposed limit on the number of page data file descriptors was
 2898 reached on an open of \fB/proc/\fR\fIpid\fR\fB/pagedata\fR; an attempt was made
 2899 with \fBPCWATCH\fR to establish more watched areas than the system can support;
 2900 the \fBPCAGENT\fR operation was issued when the system was out of resources for
 2901 creating lwps.
 2902 .RE

2904 .sp
 2905 .ne 2
 2906 .na
 2907 \fB\FBENOSYS\fR\fR
 2908 .ad
 2909 .RS 13n
 2910 An attempt was made to perform an unsupported operation (such as
 2911 \fBcreat\fR(2), \fBlink\fR(2), or \fBunlink\fR(2)) on an entry in \fB/proc\fR.
 2912 .RE

2914 .sp
 2915 .ne 2
 2916 .na
 2917 \fB\FBEOVERFLOW\fR\fR
 2918 .ad
 2919 .RS 13n
 2920 A 32-bit controlling process attempted to read or write the \fBas\fR file or
 2921 attempted to read the \fBmap\fR, \fBbrmap\fR, or \fBpagedata\fR file of a 64-bit
 2922 target process. A 32-bit controlling process attempted to apply one of the
 2923 control operations \fBPCSRREG\fR, \fBPCSXREG\fR, \fBPCSVADDR\fR, \fBPCWATCH\fR,
 2924 \fBPCAGENT\fR, \fBPCREAD\fR, \fBPCWRITE\fR to a 64-bit target process.
 2925 .RE

2927 .sp
 2928 .ne 2
 2929 .na
 2930 \fB\FBEPERM\fR\fR
 2931 .ad
 2932 .RS 13n
 2933 The process that issued the \fBPCSCRED\fR or \fBPCSCREDX\fR operation did not
 2934 have the {\fBPRIV_PROC_SETID\fR} privilege asserted in its effective set, or
 2935 the process that issued the \fBPCNICE\fR operation did not have the
 2936 {\fBPRIV_PROC_PRIOCNL\fR} in its effective set.
 2937 .sp
 2938 An attempt was made to control a process of which the E, P, and I privilege
 2939 sets were not a subset of the effective set of the controlling process or the
 2940 limit set of the controlling process is not a superset of limit set of the
 2941 controlled process.
 2942 .sp

2943 Any of the uids of the target process are 0 or an attempt was made to change
 2944 any of the uids to 0 using PCSCRED and the security policy imposed additional
 2945 restrictions. See \fBprivileges\fR(5).
 2946 .RE

2948 .SH NOTES
 2993 .sp
 2949 .LP
 2950 Descriptions of structures in this document include only interesting structure
 2951 elements, not filler and padding fields, and may show elements out of order for
 2952 descriptive clarity. The actual structure definitions are contained in
 2953 \fB<procfs.h>\fR&.
 2954 .SH BUGS
 3000 .sp
 2955 .LP
 2956 Because the old \fBioctl\fR(2)-based version of \fB/proc\fR is currently
 2957 supported for binary compatibility with old applications, the top-level
 2958 directory for a process, \fB/proc/\fR\fIpid\fR, is not world-readable, but it
 2959 is world-searchable. Thus, anyone can open \fB/proc/\fR\fIpid\fR\fB/psinfo\fR
 2960 even though \fBls\fR(1) applied to \fB/proc/\fR\fIpid\fR will fail for anyone
 2961 but the owner or an appropriately privileged process. Support for the old
 2962 \fBioctl\fR(2)-based version of \fB/proc\fR will be dropped in a future
 2963 release, at which time the top-level directory for a process will be made
 2964 world-readable.
 2965 .sp
 2966 .LP
 2967 On SPARC based machines, the types \fBgregset_t\fR and \fBfpregset_t\fR defined
 2968 in <\fBsys/regset.h\fR> are similar to but not the same as the types
 2969 \fBprgregset_t\fR and \fBprfpregset_t\fR defined in <\fBprocfs.h\fR>.

```

new/usr/src/man/man5/privileges.5
Code review comments from jeffpc
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

9 .SH NAME
9 privileges \\- process privilege model
10 .SH DESCRIPTION
11 .LP
12 Solaris software implements a set of privileges that provide fine-grained
13 control over the actions of processes. The possession of a certain privilege
14 allows a process to perform a specific set of restricted operations.
15 .sp
16 .LP
17 The change to a primarily privilege-based security model in the Solaris
18 operating system gives developers an opportunity to restrict processes to those
19 privileged operations actually needed instead of all (super-user) or no
20 privileges (non-zero UIDs). Additionally, a set of previously unrestricted
21 operations now requires a privilege; these privileges are dubbed the \"basic\"
22 privileges and are by default given to all processes.
23 .sp
24 .LP
25 Taken together, all defined privileges with the exception of the \"basic\"
26 privileges compose the set of privileges that are traditionally associated with
27 the root user. The \"basic\" privileges are \"privileges\" unprivileged processes
28 were accustomed to having.
29 .sp
30 .LP
31 The defined privileges are:
32 .sp
33 .ne 2
34 .na
35 \\fb\\fbPRIV_CONTRACT_EVENT\\fr\\fr
36 .ad
37 .sp .6
38 .RS 4n
39 Allow a process to request reliable delivery of events to an event endpoint.
40 .sp
41 Allow a process to include events in the critical event set term of a template
42 which could be generated in volume by the user.
43 .RE

45 .sp
46 .ne 2
47 .na
48 \\fb\\fbPRIV_CONTRACT_IDENTITY\\fr\\fr
49 .ad
50 .sp .6
51 .RS 4n
52 Allows a process to set the service FMRI value of a process contract template.
53 .RE

55 .sp
56 .ne 2

```

```

57 .na
58 \\fb\\fbPRIV_CONTRACT_OBSERVER\\fr\\fr
59 .ad
60 .sp .6
61 .RS 4n
62 Allow a process to observe contract events generated by contracts created and
63 owned by users other than the process's effective user ID.
64 .sp
65 Allow a process to open contract event endpoints belonging to contracts created
66 and owned by users other than the process's effective user ID.
67 .RE

69 .sp
70 .ne 2
71 .na
72 \\fb\\fbPRIV_CPC_CPU\\fr\\fr
73 .ad
74 .sp .6
75 .RS 4n
76 Allow a process to access per-CPU hardware performance counters.
77 .RE

79 .sp
80 .ne 2
81 .na
82 \\fb\\fbPRIV_DTRACE_KERNEL\\fr\\fr
83 .ad
84 .sp .6
85 .RS 4n
86 Allow DTrace kernel-level tracing.
87 .RE

89 .sp
90 .ne 2
91 .na
92 \\fb\\fbPRIV_DTRACE_PROC\\fr\\fr
93 .ad
94 .sp .6
95 .RS 4n
96 Allow DTrace process-level tracing. Allow process-level tracing probes to be
97 placed and enabled in processes to which the user has permissions.
98 .RE

100 .sp
101 .ne 2
102 .na
103 \\fb\\fbPRIV_DTRACE_USER\\fr\\fr
104 .ad
105 .sp .6
106 .RS 4n
107 Allow DTrace user-level tracing. Allow use of the syscall and profile DTrace
108 providers to examine processes to which the user has permissions.
109 .RE

111 .sp
112 .ne 2
113 .na
114 \\fb\\fbPRIV_FILE_CHOWN\\fr\\fr
115 .ad
116 .sp .6
117 .RS 4n
118 Allow a process to change a file's owner user ID. Allow a process to change a
119 file's group ID to one other than the process's effective group ID or one of
120 the process's supplemental group IDs.
121 .RE

```

```

123 .sp
124 .ne 2
125 .na
126 \fb\fbPRIV_FILE_CHOWN_SELF\fr\fr
127 .ad
128 .sp .6
129 .RS 4n
130 Allow a process to give away its files. A process with this privilege runs as
131 if {\fb_POSIX_CHOWN_RESTRICTED\fr} is not in effect.
132 .RE

134 .sp
135 .ne 2
136 .na
137 \fb\fbPRIV_FILE_DAC_EXECUTE\fr\fr
138 .ad
139 .sp .6
140 .RS 4n
141 Allow a process to execute an executable file whose permission bits or ACL
142 would otherwise disallow the process execute permission.
143 .RE

145 .sp
146 .ne 2
147 .na
148 \fb\fbPRIV_FILE_DAC_READ\fr\fr
149 .ad
150 .sp .6
151 .RS 4n
152 Allow a process to read a file or directory whose permission bits or ACL would
153 otherwise disallow the process read permission.
154 .RE

156 .sp
157 .ne 2
158 .na
159 \fb\fbPRIV_FILE_DAC_SEARCH\fr\fr
160 .ad
161 .sp .6
162 .RS 4n
163 Allow a process to search a directory whose permission bits or ACL would not
164 otherwise allow the process search permission.
165 .RE

167 .sp
168 .ne 2
169 .na
170 \fb\fbPRIV_FILE_DAC_WRITE\fr\fr
171 .ad
172 .sp .6
173 .RS 4n
174 Allow a process to write a file or directory whose permission bits or ACL do
175 not allow the process write permission. All privileges are required to write
176 files owned by UID 0 in the absence of an effective UID of 0.
177 .RE

179 .sp
180 .ne 2
181 .na
182 \fb\fbPRIV_FILE_DOWNGRADE_SL\fr\fr
183 .ad
184 .sp .6
185 .RS 4n
186 Allow a process to set the sensitivity label of a file or directory to a
187 sensitivity label that does not dominate the existing sensitivity label.
188 .sp

```

```

189 This privilege is interpreted only if the system is configured with Trusted
190 Extensions.
191 .RE

193 .sp
194 .ne 2
195 .na
196 \fb\fbPRIV_FILE_FLAG_SET\fr\fr
197 .ad
198 .sp .6
199 .RS 4n
200 Allows a process to set immutable, nounlink or appendonly file attributes.
201 .RE

203 .sp
204 .ne 2
205 .na
206 \fb\fbPRIV_FILE_LINK_ANY\fr\fr
207 .ad
208 .sp .6
209 .RS 4n
210 Allow a process to create hardlinks to files owned by a UID different from the
211 process's effective UID.
212 .RE

214 .sp
215 .ne 2
216 .na
217 \fb\fbPRIV_FILE_OWNER\fr\fr
218 .ad
219 .sp .6
220 .RS 4n
221 Allow a process that is not the owner of a file to modify that file's access
222 and modification times. Allow a process that is not the owner of a directory to
223 modify that directory's access and modification times. Allow a process that is
224 not the owner of a file or directory to remove or rename a file or directory
225 whose parent directory has the "save text image after execution" (sticky) bit
226 set. Allow a process that is not the owner of a file to mount a \fbnamefs\fr
227 upon that file. Allow a process that is not the owner of a file or directory to
228 modify that file's or directory's permission bits or ACL.
229 .RE

231 .sp
232 .ne 2
233 .na
234 \fb\fbPRIV_FILE_READ\fr\fr
235 .ad
236 .sp .6
237 .RS 4n
238 Allow a process to open objects in the filesystem for reading. This
239 privilege is not necessary to read from an already open file which was opened
240 before dropping the \fbPRIV_FILE_READ\fr privilege.
241 .RE

243 .sp
244 .ne 2
245 .na
246 \fb\fbPRIV_FILE_SETID\fr\fr
247 .ad
248 .sp .6
249 .RS 4n
250 Allow a process to change the ownership of a file or write to a file without
251 the set-user-ID and set-group-ID bits being cleared. Allow a process to set the
252 set-group-ID bit on a file or directory whose group is not the process's
253 effective group or one of the process's supplemental groups. Allow a process to
254 set the set-user-ID bit on a file with different ownership in the presence of

```

```

255 \fbPRIV_FILE_OWNER\fr. Additional restrictions apply when creating or modifying
256 a setuid 0 file.
257 .RE

259 .sp
260 .ne 2
261 .na
262 \fb\fbPRIV_FILE_UPGRADE_SL\fr\fr
263 .ad
264 .sp .6
265 .RS 4n
266 Allow a process to set the sensitivity label of a file or directory to a
267 sensitivity label that dominates the existing sensitivity label.
268 .sp
269 This privilege is interpreted only if the system is configured with Trusted
270 Extensions.
271 .RE

273 .sp
274 .ne 2
275 .na
276 \fb\fbPRIV_FILE_WRITE\fr\fr
277 .ad
278 .sp .6
279 .RS 4n
280 Allow a process to open objects in the filesystem for writing, or otherwise
281 modify them. This privilege is not necessary to write to an already open file
282 which was opened before dropping the \fbPRIV_FILE_WRITE\fr privilege.
283 .RE

```

```

321 .na
322 \fb\fbPRIV_IPC_DAC_WRITE\fr\fr
323 .ad
324 .sp .6
325 .RS 4n
326 Allow a process to write a System V IPC Message Queue, Semaphore Set, or Shared
327 Memory Segment whose permission bits would not otherwise allow the process
328 write permission.
329 .RE

331 .sp
332 .ne 2
333 .na
334 \fb\fbPRIV_IPC_OWNER\fr\fr
335 .ad
336 .sp .6
337 .RS 4n
338 Allow a process that is not the owner of a System V IPC Message Queue,
339 Semaphore Set, or Shared Memory Segment to remove, change ownership of, or
340 change permission bits of the Message Queue, Semaphore Set, or Shared Memory
341 Segment.
342 .RE

344 .sp
345 .ne 2
346 .na
347 \fb\fbPRIV_NET_ACCESS\fr\fr
348 .ad
349 .sp .6
350 .RS 4n
351 Allow a process to open a TCP, UDP, SDP, or SCTP network endpoint. This
352 privilege is not necessary to communicate using an existing endpoint already
353 opened before dropping the \fbPRIV_NET_ACCESS\fr privilege.
354 .RE

356 .sp
357 .ne 2
358 .na
359 \fb\fbPRIV_NET_BINDMLP\fr\fr
360 .ad
361 .sp .6
362 .RS 4n
363 Allow a process to bind to a port that is configured as a multi-level port
364 (MLP) for the process's zone. This privilege applies to both shared address and
365 zone-specific address MLPs. See \fb\fbB4\fr from the Trusted
366 Extensions manual pages for information on configuring MLP ports.
367 .sp
368 This privilege is interpreted only if the system is configured with Trusted
369 Extensions.
370 .RE

372 .sp
373 .ne 2
374 .na
375 \fb\fbPRIV_NET_ICMPACCESS\fr\fr
376 .ad
377 .sp .6
378 .RS 4n
379 Allow a process to send and receive ICMP packets.
380 .RE

382 .sp
383 .ne 2
384 .na
385 \fb\fbPRIV_NET_MAC_AWARE\fr\fr
386 .ad

```

```

387 .sp .6
388 .RS 4n
389 Allow a process to set the \fBNET_MAC_AWARE\fR process flag by using
390 \fBsetpflags\fR(2). This privilege also allows a process to set the
391 \fBBSO_MAC_EXEMPT\fR socket option by using \fBsetsockopt\fR(3SOCKET). The
392 \fBNET_MAC_AWARE\fR process flag and the \fBBSO_MAC_EXEMPT\fR socket option both
393 allow a local process to communicate with an unlabeled peer if the local
394 process's label dominates the peer's default label, or if the local process
395 runs in the global zone.
396 .sp
397 This privilege is interpreted only if the system is configured with Trusted
398 Extensions.

1077 .ad
1078 .sp .6
1079 .RS 4n
1080 Allows a process access to the \fBxVM\fR(5) control devices for managing guest
1081 domains and the hypervisor. This privilege is used only if booted into xVM on
1082 x86 platforms.
1083 .RE

1085 .sp
1086 .LP
1087 Of the privileges listed above, the privileges \fBPRIV_FILE_LINK_ANY\fR,
1088 \fBPRIV_PROC_INFO\fR, \fBPRIV_PROC_SESSION\fR, \fBPRIV_PROC_FORK\fR,
1089 \fBPRIV_FILE_READ\fR, \fBPRIV_FILE_WRITE\fR, \fBPRIV_NET_ACCESS\fR and
1090 \fBPRIV_PROC_EXEC\fR are considered "basic" privileges. These are privileges
1091 that used to be always available to unprivileged processes. By default,
1092 processes still have the basic privileges.
1093 .sp
1094 .LP
1095 The privileges \fBPRIV_PROC_SETID\fR and \fBPRIV_PROC_AUDIT\fR must be present
1096 in the Limit set (see below) of a process in order for set-uid root \fBExec\fRs
1097 to be successful, that is, get an effective UID of 0 and additional privileges.
1098 .sp
1099 .LP
1100 The privilege implementation in Solaris extends the process credential with
1101 four privilege sets:
1102 .sp
1103 .ne 2
1104 .na
1105 \fBBI, the inheritable set\fR
1106 .ad
1107 .RS 26n
1108 The privileges inherited on \fBExec\fR.
1109 .RE

1111 .sp
1112 .ne 2

```

```

1113 .na
1114 \fBFBP, the permitted set\fR
1115 .ad
1116 .RS 26n
1117 The maximum set of privileges for the process.
1118 .RE

1120 .sp
1121 .ne 2
1122 .na
1123 \fBFE, the effective set\fR
1124 .ad
1125 .RS 26n
1126 The privileges currently in effect.
1127 .RE

1129 .sp
1130 .ne 2
1131 .na
1132 \fBFL, the limit set\fR
1133 .ad
1134 .RS 26n
1135 The upper bound of the privileges a process and its offspring can obtain.
1136 Changes to L take effect on the next \fBExec\fR.
1137 .RE

1139 .sp
1140 .LP
1141 The sets I, P and E are typically identical to the basic set of privileges for
1142 unprivileged processes. The limit set is typically the full set of privileges.
1143 .sp
1144 .LP
1145 Each process has a Privilege Awareness State (PAS) that can take the value PA
1146 (privilege-aware) and NPA (not-PA). PAS is a transitional mechanism that allows
1147 a choice between full compatibility with the old superuser model and completely
1148 ignoring the effective UID.
1149 .sp
1150 .LP
1151 To facilitate the discussion, we introduce the notion of "observed effective
1152 set" (oE) and "observed permitted set" (oP) and the implementation sets iE and
1153 iP.
1154 .sp
1155 .LP
1156 A process becomes privilege-aware either by manipulating the effective,
1157 permitted, or limit privilege sets through \fBsetpriv\fR(2) or by using
1158 \fBsetpflags\fR(2). In all cases, oE and oP are invariant in the process of
1159 becoming privilege-aware. In the process of becoming privilege-aware, the
1160 following assignments take place:
1161 .sp
1162 .in +2
1163 .nf
1164 iE = oE
1165 iP = oP
1166 .fi
1167 .in -2

1169 .sp
1170 .LP
1171 When a process is privilege-aware, oE and oP are invariant under UID changes.
1172 When a process is not privilege-aware, oE and oP are observed as follows:
1173 .sp
1174 .in +2
1175 .nf
1176 oE = euid == 0 ? L : iE
1177 oP = (euid == 0 || ruid == 0 || suid == 0) ? L : iP
1178 .fi

```

```

1179 .in -2
1181 .sp
1182 .LP
1183 When a non-privilege-aware process has an effective UID of 0, it can exercise
1184 the privileges contained in its limit set, the upper bound of its privileges.
1185 If a non-privilege-aware process has any of the UIDs 0, it appears to be
1186 capable of potentially exercising all privileges in L.
1187 .sp
1188 .LP
1189 It is possible for a process to return to the non-privilege aware state using
1190 \fBsetpflags()\fR. The kernel always attempts this on \fBexec\fR(2). This
1191 operation is permitted only if the following conditions are met:
1192 .RS +4
1193 .TP
1194 .ie t \(\bu
1195 .el o
1196 If any of the UIDs is equal to 0, P must be equal to L.
1197 .RE
1198 .RS +4
1199 .TP
1200 .ie t \(\bu
1201 .el o
1202 If the effective UID is equal to 0, E must be equal to L.
1203 .RE
1204 .sp
1205 .LP
1206 When a process gives up privilege awareness, the following assignments take
1207 place:
1208 .sp
1209 .in +2
1210 .nf
1211 if (euid == 0) iE = L & I
1212 if (any uid == 0) iP = L & I
1213 .fi
1214 .in -2

1216 .sp
1217 .LP
1218 The privileges obtained when not having a UID of \fB0\fR are the inheritable
1219 set of the process restricted by the limit set.
1220 .sp
1221 .LP
1222 Only privileges in the process's (observed) effective privilege set allow the
1223 process to perform restricted operations. A process can use any of the
1224 privilege manipulation functions to add or remove privileges from the privilege
1225 sets. Privileges can be removed always. Only privileges found in the permitted
1226 set can be added to the effective and inheritable set. The limit set cannot
1227 grow. The inheritable set can be larger than the permitted set.
1228 .sp
1229 .LP
1230 When a process performs an \fBexec\fR(2), the kernel first tries to relinquish
1231 privilege awareness before making the following privilege set modifications:
1232 .sp
1233 .in +2
1234 .nf
1235 E' = P' = I' = L & I
1236 L is unchanged
1237 .fi
1238 .in -2

1240 .sp
1241 .LP
1242 If a process has not manipulated its privileges, the privilege sets effectively
1243 remain the same, as E, P and I are already identical.
1244 .sp

```

```

1245 .LP
1246 The limit set is enforced at \fBexec\fR time.
1247 .sp
1248 .LP
1249 To run a non-privilege-aware application in a backward-compatible manner, a
1250 privilege-aware application should start the non-privilege-aware application
1251 with I=basic.
1252 .sp
1253 .LP
1254 For most privileges, absence of the privilege simply results in a failure. In
1255 some instances, the absence of a privilege can cause system calls to behave
1256 differently. In other instances, the removal of a privilege can force a set-uid
1257 application to seriously malfunction. Privileges of this type are considered
1258 "unsafe". When a process is lacking any of the unsafe privileges from its limit
1259 set, the system does not honor the set-uid bit of set-uid root applications.
1260 The following unsafe privileges have been identified: \fBproc_setid\fR,
1261 \fBsys_resource\fR and \fBproc_audit\fR.
1262 .SS "Privilege Escalation"
1263 .LP
1264 In certain circumstances, a single privilege could lead to a process gaining
1265 one or more additional privileges that were not explicitly granted to that
1266 process. To prevent such an escalation of privileges, the security policy
1267 requires explicit permission for those additional privileges.
1268 .sp
1269 .LP
1270 Common examples of escalation are those mechanisms that allow modification of
1271 system resources through "raw" interfaces; for example, changing kernel data
1272 structures through \fB/dev/kmem\fR or changing files through \fB/dev/dsk/*\fR.
1273 Escalation also occurs when a process controls processes with more privileges
1274 than the controlling process. A special case of this is manipulating or
1275 creating objects owned by UID 0 or trying to obtain UID 0 using
1276 \fBsetuid\fR(2). The special treatment of UID 0 is needed because the UID 0
1277 owns all system configuration files and ordinary file protection mechanisms
1278 allow processes with UID 0 to modify the system configuration. With appropriate
1279 file modifications, a given process running with an effective UID of 0 can gain
1280 all privileges.
1281 .sp
1282 .LP
1283 In situations where a process might obtain UID 0, the security policy requires
1284 additional privileges, up to the full set of privileges. Such restrictions
1285 could be relaxed or removed at such time as additional mechanisms for
1286 protection of system files became available. There are no such mechanisms in
1287 the current Solaris release.
1288 .sp
1289 .LP
1290 The use of UID 0 processes should be limited as much as possible. They should
1291 be replaced with programs running under a different UID but with exactly the
1292 privileges they need.
1293 .sp
1294 .LP
1295 Daemons that never need to \fBexec\fR subprocesses should remove the
1296 \fBPRIV_PROC_EXEC\fR privilege from their permitted and limit sets.
1297 .SS "Assigned Privileges and Safeguards"
1298 .LP
1299 When privileges are assigned to a user, the system administrator could give
1300 that user more powers than intended. The administrator should consider whether
1301 safeguards are needed. For example, if the \fBPRIV_PROC_LOCK_MEMORY\fR
1302 privilege is given to a user, the administrator should consider setting the
1303 \fBproject.max-locked-memory\fR resource control as well, to prevent that user
1304 from locking all memory.
1305 .SS "Privilege Debugging"
1306 .LP
1307 When a system call fails with a permission error, it is not always immediately
1308 obvious what caused the problem. To debug such a problem, you can use a tool
1309 called \fBprivilege debugging\fR. When privilege debugging is enabled for a
1310 process, the kernel reports missing privileges on the controlling terminal of

```

```
1311 the process. (Enable debugging for a process with the \fB-D\fR option of
1312 \fBppriv\fR(1).) Additionally, the administrator can enable system-wide
1313 privilege debugging by setting the \fBsystem\fR(4) variable \fBpriv_debug\fR
1314 using:
1315 .sp
1316 .in +2
1317 .nf
1318 set priv_debug = 1
1319 .fi
1320 .in -2

1322 .sp
1323 .LP
1324 On a running system, you can use \fBmdb\fR(1) to change this variable.
1325 .SS "Privilege Administration"
1326 .LP
1327 The Solaris Management Console (see \fBsmc\fR(1M)) is the preferred method of
1328 modifying privileges for a command. Use \fBusermod\fR(1M) or \fBsmrole\fR(1M)
1329 to assign privileges to or modify privileges for, respectively, a user or a
1330 role. Use \fBppriv\fR(1) to enumerate the privileges supported on a system and
1331 \fBtruss\fR(1) to determine which privileges a program requires.

13 .TH "SECURITY-FLAGS" "5" "June 6, 2016"
14 .SH "NAME"
15 \fBsecurity-flags\fR - process security flags
16 .SH "DESCRIPTION"
17 Each process on an illumos system has an associated set of security-flags
18 which describe additional per-process security and exploit mitigation
19 features which are enabled for that process.
20 .P
21 There are four sets of these flags for each process, the effective set
22 (abbreviated \fIE\fR) are the set which currently apply to the process and are
23 immutable. The inheritable set (abbreviated \fII\fR) are the flags which will
24 become effective the next time the process calls one of the \fBexec(2)\fR
25 family of functions, and will be inherited as both the effective and
26 inheritable sets by any child processes. The upper set (abbreviated \fIU\fR)
27 specify the maximal flags that a process can have in its inheritable set. The
28 lower set (abbreviated \fIL\fR) specify the minimal amount of flags that a
29 process must have in its inheritable set. The inheritable set may be changed
30 at any time, subject to permissions and the lower and upper sets.
31 .P
32 To change the security-flags of a process one must have both permissions
33 equivalent to those required to send a signal to the process and have the
34 \fBPRIV_PROC_SECFLAGS\fR privilege.
35 .P
36 Currently available features are:

38 .sp
39 .ne 2
40 .na
41 Address Space Layout Randomisation (\fBASLR\fR)
42 .ad
43 .RS 11n
44 The base addresses of the stack, heap and shared library (including
45 \fBld.so\fR) mappings are randomised, the bases of mapped regions other than
46 those using \fBMAP_FIXED\fR are randomised.
47 .P
48 Currently, executable base addresses are \fInot\fR randomised, due to which
49 the mitigation provided by this feature is currently limited.
50 .P
51 This flag may also be enabled by the presence of the \fBBDT_SUNW_ASLR\fR
52 dynamic tag in the \fBdynamic\fR section of the executable file. If this
53 tag has a value of 1, ASLR will be enabled. If the flag has a value of
54 \fB0\fR ASLR will be disabled. If the tag is not present, the value of the
55 ASLR flag will be inherited as normal.
56 .RE

```

```

58 .sp
59 .ne 2
60 .na
61 Forbid mappings at NULL (\fBFORBIDNULLMAP\fR)
62 .ad
63 .RS 11n
64 Mappings with an address of 0 are forbidden, and return EINVAL rather than
65 being honored.
66 .RE

68 .sp
69 .ne 2
70 .na
71 Make the userspace stack non-executable (\fBNOEXECSTACK\fR)
72 .ad
73 .RS 11n
74 The stack will be mapped without executable permission, and attempts to
75 execute it will fault.
76 .RE

78 System default security-flags are configured via properties on the
79 \fBsvc:/system/process-security\fR service, which contains a boolean property
80 per-flag in the \fBdefault\fR, \fBblower\fR and \fBbupper\fR, property groups.
81 For example, to enable ASLR by default you would execute the following
82 commands:
83 .sp
84 .in +2
85 .nf
86 # svccfg -s svc:/system/process-security setprop default/aslr = true
87 .fi
88 .in -2
89 .sp
90 .P
91 This can be done by any user with the \fBsolaris.smf.value.process-security\fR
92 authorization.
93 .P
94 Since security-flags are strictly inherited, this will not take effect until
95 the system or zone is next booted.

97 .SH "SEE ALSO"
98 .BR psecflags (1),
99 .BR svccfg (1M),
100 .BR brk (2),
101 .BR exec (2),

6 .TH SMF_METHOD 5 \"May 20, 2009\"
7 .SH NAME
8 smf_method \- service management framework conventions for methods
9 .SH DESCRIPTION
10 .sp
10 .LP
11 The class of services managed by \fBsvc.startd\fR(1M) in the service management
12 framework, \fBsmf\fR(5), consists of applications that fit a simple
13 \fBfork\fR(2)-\fBexec\fR(2) model. The \fBsvc.startd\fR(1M) master daemon and
14 other restarters support the \fBfork\fR(2)-\fBexec\fR(2) model, potentially
15 with additional capabilities. The \fBsvc.startd\fR(1M) daemon and other
16 restarters require that the methods which activate, manipulate, or examine a
17 service instance follow the conventions described in this manual page.
18 .SS \"Invocation form\"
20 .sp
19 .LP
20 The form of a method invocation is not dictated by convention. In some cases, a
21 method invocation might consist of the direct invocation of the daemon or other
22 binary executable that provides the service. For cases in which an executable
23 script or other mediating executable is used, the convention recommends the
24 form:
25 .sp
26 .in +2
27 .nf
28 /path/to/method_executable abbr_method_name
29 .fi
30 .in -2

32 .sp
33 .LP
34 The \fIabbr_method_name\fR used for the recommended form is a supported method
35 such as \fBstart\fR or \fBstop\fR. The set of methods supported by a restarter
36 is given on the related restarter page. The \fBsvc.startd\fR(1M) daemon
37 supports \fBstart\fR, \fBstop\fR, and \fBrefresh\fR methods.
38 .sp
39 .LP
40 A restarter might define other kinds of methods beyond those referenced in this
41 page. The conventions surrounding such extensions are defined by the restarter
42 and might not be identical to those given here.
43 .SS \"Environment Variables\"
46 .sp
44 .LP
45 The restarter provides four environment variables to the method that determine
46 the context in which the method is invoked.
47 .sp
48 .ne 2
49 .na
50 \fB\BFSMF_FMRI\fR
51 .ad
52 .sp .6
53 .RS 4n

```

```

54 The service fault management resource identifier (FMRI) of the instance for
55 which the method is invoked.
56 .RE

58 .sp
59 .ne 2
60 .na
61 \fB\BFSMF_METHOD\fR
62 .ad
63 .sp .6
64 .RS 4n
65 The full name of the method being invoked, such as \fBstart\fR or \fBstop\fR.
66 .RE

68 .sp
69 .ne 2
70 .na
71 \fB\BFSMF_RESTARTER\fR
72 .ad
73 .sp .6
74 .RS 4n
75 The service FMRI of the restarter that invokes the method
76 .RE

78 .sp
79 .ne 2
80 .na
81 \fB\BFSMF_ZONENAME\fR
82 .ad
83 .sp .6
84 .RS 4n
85 The name of the zone in which the method is running. This can also be obtained
86 by using the \fBzonename\fR(1) command.
87 .RE

89 .sp
90 .LP
91 These variables should be removed from the environment prior to the invocation
92 of any persistent process by the method. A convenience shell function,
93 \fBsmf_clear_env\fR, is given for service authors who use Bourne-compatible
94 shell scripting to compose service methods in the include file described below.
95 .sp
96 .LP
97 The method context can cause other environment variables to be set as described
98 below.
99 .SS \"Method Definition\"
103 .sp
100 .LP
101 A method is defined minimally by three properties in a propertygroup of type
102 \fBmethod\fR.
103 .sp
104 .LP
105 These properties are:
106 .sp
107 .ne 2
108 .na
109 \fB\Bexec (\fIastring\fR)\fR
110 .ad
111 .RS 27n
112 Method executable string.
113 .RE

115 .sp
116 .ne 2
117 .na
118 \fB\Btimeout_seconds (\fIcount\fR)\fR

```

```

119 .ad
120 .RS 27n
121 Number of seconds before method times out. See the \fBTimeouts\fR section for
122 more detail.
123 .RE

125 .sp
126 .ne 2
127 .na
128 \fBtype (\fIastring\fR)\fR
129 .ad
130 .RS 27n
131 Method type. Currently always set to \fBmethod\fR.
132 .RE

134 .sp
135 .LP
136 A Method Context can be defined to further refine the execution environment of
137 the method. See the \fBMethod Context\fR section for more information.
138 .SS "Method Tokens"
139 .sp
140 When defined in the \fBexec\fR string of the method by the restarter
141 \fBsvc.startd\fR, a set of tokens are parsed and expanded with appropriate
142 value. Other restarters might not support method tokens. The delegated
143 restarter for inet services, \fBinetd\fR(1M), does not support the following
144 method expansions.
145 .sp
146 .ne 2
147 .na
148 \fB\fB%\fR\fR
149 .ad
150 .sp .6
151 .RS 4n
152 %
153 .RE

155 .sp
156 .ne 2
157 .na
158 \fB\fB:r\fR\fR
159 .ad
160 .sp .6
161 .RS 4n
162 Name of the restarter, such as \fBsvc.startd\fR
163 .RE

165 .sp
166 .ne 2
167 .na
168 \fB\fB:m\fR\fR
169 .ad
170 .sp .6
171 .RS 4n
172 The full name of the method being invoked, such as \fBstart\fR or \fBstop\fR.
173 .RE

175 .sp
176 .ne 2
177 .na
178 \fB\fB:s\fR\fR
179 .ad
180 .sp .6
181 .RS 4n
182 Name of the service
183 .RE

```

```

185 .sp
186 .ne 2
187 .na
188 \fB\fB:i\fR\fR
189 .ad
190 .sp .6
191 .RS 4n
192 Name of the instance
193 .RE

195 .sp
196 .ne 2
197 .na
198 \fB\fB:f\fR\fR
199 .ad
200 .sp .6
201 .RS 4n
202 FMRI of the instance
203 .RE

205 .sp
206 .ne 2
207 .na
208 \fB\fB{prop[:]}\fR\fR
209 .ad
210 .sp .6
211 .RS 4n
212 Value(s) of a property. The \fBprop\fR might be a property FMRI, a property
213 group name and a property name separated by a \fB/\fR, or a property name in
214 the \fBApplication\fR property group. These values can be followed by a \fB,\fR
215 (comma) or \fB:\fR (colon). If present, the separators are used to separate
216 multiple values. If absent, a space is used. The following shell metacharacters
217 encountered in string values are quoted with a \ (backslash):
218 .sp
219 .in +2
220 .nf
221 ; & ( ) | ^ < > newline space tab \ " '
222 .fi
223 .in -2

225 An invalid expansion constitutes method failure.
226 .RE

228 .sp
229 .LP
230 Two explicit tokens can be used in the place of method commands.
231 .sp
232 .ne 2
233 .na
234 \fB\fB:kill [-signal]\fR\fR
235 .ad
236 .sp .6
237 .RS 4n
238 Sends the specified signal, which is \fBSIGTERM\fR by default, to all processes
239 in the primary instance contract. Always returns \fBEXIT_OK\fR. This token
240 should be used to replace common \fBkill\fR invocations.
241 .RE

243 .sp
244 .ne 2
245 .na
246 \fB\fB:true\fR\fR
247 .ad
248 .sp .6
249 .RS 4n

```

```

250 Always returns \fB$EXIT_OK\fR. This token should be used for methods that
251 are required by the restarters but which are unnecessary for the particular
252 service implementation.
253 .RE

255 .SS "Exiting and Exit Status"
256 .sp
257 .LP
258 The required behavior of a start method is to delay exiting until the service
259 instance is ready to answer requests or is otherwise functional.
260 .sp
261 .LP
262 The following exit status codes are defined in \fB<libscf.h>\fR and in the
263 shell support file.

265 .sp
266 .TS
267 1 1 1
268 1 1 1 .
269 \fB$EXIT_OK\fR          \fB0\fR T{
270 Method exited, performing its operation successfully.
271 T}
272 \fB$EXIT_ERR_FATAL\fR   \fB95\fR T{
273 Method failed fatally and is unrecoverable without administrative intervention.
274 T}
275 \fB$EXIT_ERR_CONFIG\fR   \fB96\fR T{
276 Unrecoverable configuration error. A common condition that returns this exit sta
277 T}
278 \fB$EXIT_ERR_NOSMF\fR    \fB99\fR T{
279 Method has been mistakenly invoked outside the \fB$smf(5)\fR facility. Services t
280 T}
281 \fB$EXIT_ERR_PERM\fR     \fB100\fR T{
282 Method requires a form of permission such as file access, privilege, authorizati
283 T}
284 \fB$EXIT_ERR_OTHER\fR    \fBnon-zero\fR T{
285 Any non-zero exit status from a method is treated as an unknown error. A series
286 T}
287 .TE

289 .sp
290 .LP
291 Use of a precise exit code allows the responsible restarters to categorize an
292 error response as likely to be intermittent and worth pursuing restart or
293 permanent and request administrative intervention.
294 .SS "Timeouts"
295 .sp
296 .LP
297 Each method can have an independent timeout, given in seconds. The choice of a
298 particular timeout should be based on site expectations for detecting a method
299 failure due to non-responsiveness. Sites with replicated filesystems or other
300 failover resources can elect to lengthen method timeouts from the default.
301 Sites with no remote resources can elect to shorten the timeouts. Method
302 timeout is specified by the \fBtimeout_seconds\fR property.
303 .sp
304 .LP
305 If you specify \fB0 timeout_seconds\fR for a method, it declares to the
306 restarters that there is no timeout for the service. This setting is not
307 preferred, but is available for services that absolutely require it.
308 .sp
309 .LP
310 \fB-1 timeout_seconds\fR is also accepted, but is a deprecated specification.
311 .SS "Shell Programming Support"
312 .sp
313 A set of environment variables that define the above exit status values is

```

```

313 provided with convenience shell functions in the file
314 \fB/lib/svc/share/smf_include.sh\fR. This file is a Bourne shell script
315 suitable for inclusion via the source operator in any Bourne-compatible shell.
316 .sp
317 .LP
318 To assist in the composition of scripts that can serve as SMF methods as well
319 as \fB/etc/init.d\fR scripts, the \fBsmf_present()\fR shell function is
320 provided. If the \fB$smf(5)\fR facility is not available, \fBsmf_present()\fR
321 returns a non-zero exit status.
322 .sp
323 .LP
324 One possible structure for such a script follows:
325 .sp
326 .in +2
327 .nf
328 if smf_present; then
329     # Shell code to run application as managed service
330     ....
331
332     smf_clear_env
333 else
334     # Shell code to run application as /etc/init.d script
335     ....
336 fi
337 .fi
338 .in -2

340 .sp
341 .LP
342 This example shows the use of both convenience functions that are provided.
343 .SS "Method Context"
344 .sp
345 .LP
346 The service management facility offers a common mechanism set the context in
347 which the \fBfork(2)\fR-\fBexec(2)\fR model services execute.
348 .sp
349 .LP
350 The desired method context should be provided by the service developer. All
351 service instances should run with the lowest level of privileges possible to
352 limit potential security compromises.
353 .sp
354 .LP
355 A method context can contain the following properties:
356 .sp
357 .ne 2
358 .na
359 \fB$Buse_profile\fR
360 .ad
361 .sp .6
362 .RS 4n
363 A boolean that specifies whether the profile should be used instead of the
364 \fB$Buser\fR, \fB$Bgroup\fR, \fB$Bprivileges\fR, and \fB$Blimit_privileges\fR
365 properties.
366 .RE

367 .sp
368 .ne 2
369 .na
370 \fB$Benvironment\fR
371 .ad
372 .sp .6
373 .RS 4n
374 Environment variables to insert into the environment of the method, in the form
375 of a number of \fB$BNAME=value\fR strings.
376 .RE

```

```

378 .sp
379 .ne 2
380 .na
381 \fB\fBprofile\fR\fR
382 .ad
383 .sp .6
384 .RS 4n
385 The name of an RBAC (role-based access control) profile which, along with the
386 method executable, identifies an entry in \fBexec_attr\fR(4).
387 .RE

389 .sp
390 .ne 2
391 .na
392 \fB\fBuser\fR\fR
393 .ad
394 .sp .6
395 .RS 4n
396 The user ID in numeric or text form.
397 .RE

399 .sp
400 .ne 2
401 .na
402 \fB\fBgroup\fR\fR
403 .ad
404 .sp .6
405 .RS 4n
406 The group ID in numeric or text form.
407 .RE

409 .sp
410 .ne 2
411 .na
412 \fB\fBsupp_groups\fR\fR
413 .ad
414 .sp .6
415 .RS 4n
416 An optional string that specifies the supplemental group memberships by ID, in
417 numeric or text form.
418 .RE

420 .sp
421 .ne 2
422 .na
423 \fB\fBprivileges\fR\fR
424 .ad
425 .sp .6
426 .RS 4n
427 An optional string specifying the privilege set as defined in
428 \fBprivileges\fR(5).
429 .RE

431 .sp
432 .ne 2
433 .na
434 \fB\fBlimit_privileges\fR\fR
435 .ad
436 .sp .6
437 .RS 4n
438 An optional string specifying the limit privilege set as defined in
439 \fBprivileges\fR(5).
440 .RE

442 .sp
443 .ne 2

```

```

444 .na
445 \fB\fBworking_directory\fR\fR
446 .ad
447 .sp .6
448 .RS 4n
449 The home directory from which to launch the method. \fB:home\fR can be used as
450 a token to indicate the home directory of the user whose \fBuid\fR is used to
451 launch the method. If the property is unset, \fB:home\fR is used.
452 .RE

454 .sp
455 .ne 2
456 .na
457 \fB\fBsecurity_flags\fR\fR
458 .ad
459 .sp .6
460 .RS 4n
461 The security flags to apply when launching the method. See \fBsecurity-flags\fR
462 .sp
463 .LP
464 The "default" keyword specifies those flags specified in
465 \fBsvc:/system/process-security\fR. The "all" keyword enables all flags, the
466 "none" keyword enables no flags. Further flags may be added by specifying
467 their name, or removed by specifying their name prefixed by '-' or '!'.
468 .sp
469 .LP
470 Use of "all" has associated risks, as future versions of the system may
471 include further flags which may harm poorly implemented software.
472 .RE

474 .sp
475 .ne 2
476 .na
477 #endif /* ! codereview */
478 \fB\fBcorefile_pattern\fR\fR
479 .ad
480 .sp .6
481 .RS 4n
482 An optional string that specifies the corefile pattern to use for the service,
483 as per \fBcoreadm\fR(1M). Most restarters supply a default. Setting this
484 property overrides local customizations to the global core pattern.
485 .RE

487 .sp
488 .ne 2
489 .na
490 \fB\fBproject\fR\fR
491 .ad
492 .sp .6
493 .RS 4n
494 The project ID in numeric or text form. \fB:default\fR can be used as a token
495 to indicate a project identified by \fBgetdefaultproj\fR(3PROJECT) for the user
496 whose \fBuid\fR is used to launch the method.
497 .RE

499 .sp
500 .ne 2
501 .na
502 \fB\fBresource_pool\fR\fR
503 .ad
504 .sp .6
505 .RS 4n
506 The resource pool name on which to launch the method. \fB:default\fR can be
507 used as a token to indicate the pool specified in the \fBproject\fR(4) entry
508 given in the \fBproject\fR attribute above.
509 .RE

```

```

511 .sp
512 .LP
513 The method context can be set for the entire service instance by specifying a
514 \fBmethod_context\fR property group for the service or instance. A method might
515 override the instance method context by providing the method context properties
516 on the method property group.
517 .sp
518 .LP
519 Invalid method context settings always lead to failure of the method, with the
520 exception of invalid environment variables that issue warnings.
521 .sp
522 .LP
523 In addition to the context defined above, many \fBfork\fR(2)-\fBexec\fR(2)
524 model restarters also use the following conventions when invoking executables
525 as methods:
526 .sp
527 .ne 2
528 .na
529 \fBArgument array\fR
530 .ad
531 .sp .6
532 .RS 4n
533 The arguments in \fBargv[]\fR are set consistently with the result \fB/bin/sh
534 -c\fR of the \fBexec\fR string.
535 .RE

537 .sp
538 .ne 2
539 .na
540 \fBFile descriptors\fR
541 .ad
542 .sp .6
543 .RS 4n
544 File descriptor \fB0\fR is \fB/dev/null\fR. File descriptors \fB1\fR and
545 \fB2\fR are recommended to be a per-service log file.
546 .RE

548 .SH FILES
466 .sp
549 .ne 2
550 .na
551 \fB\fB/lib/svc/share/smf_include.sh\fR\fR
552 .ad
553 .sp .6
554 .RS 4n
555 Definitions of exit status values.
556 .RE

558 .sp
559 .ne 2
560 .na
561 \fB\fB/usr/include/libscf.h\fR\fR
562 .ad
563 .sp .6
564 .RS 4n
565 Definitions of exit status codes.
566 .RE

576 .SH NOTES
495 .sp
577 .LP
578 The present version of \fBsmf\fR(5) does not support multiple repositories.
579 .sp
580 .LP
581 When a service is configured to be started as root but with privileges
582 different from \fBlimit_privileges\fR, the resulting process is privilege
583 aware. This can be surprising to developers who expect \fBsetuid<non-zero
584 UID>\fR to reduce privileges to basic or less.

new/usr/src/pkg/manifests/SUNWcs.mf
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

new/usr/src/pkg/manifests/consolidation-osnet-osnet-message-files.mf
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

new/usr/src/pkg/manifests/system-extended-system-utilities.mf
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

new/usr/src/pkg/manifests/system-header.mf
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

30 # uts/common/Makefile.rules
31 #
32 # This Makefile defines all the file build rules for the directory
33 # uts/common and its children. These are the source files which may
34 # be considered common to all SunOS systems.
35 #
36 # The following two-level ordering must be maintained in this file.
37 # Lines are sorted first in order of decreasing specificity based on
38 # the first directory component. That is, sun4u rules come before
39 # sparc rules come before common rules.
40 #
41 # Lines whose initial directory components are equal are sorted
42 # alphabetically by the remaining components.
43 #
44 #
45 # Section 1a: C objects build rules

709 /*
710 * ROUTINE:      AUDIT_CLOSEF
711 * PURPOSE:
712 * CALLBY:      CLOSEF
713 * NOTE:
714 * release per file audit resources when file structure is being released.
715 *
716 * IMPORTANT NOTE: Since we generate an audit record here, we may sleep
717 * on the audit queue if it becomes full. This means
718 * audit_closef can not be called when f_count == 0. Since
719 * f_count == 0 indicates the file structure is free, another
720 * process could attempt to use the file while we were still
721 * asleep waiting on the audit queue. This would cause the
722 * per file audit data to be corrupted when we finally do
723 * wakeup.
724 * TODO:
725 * QUESTION:
726 */

*****
14681 Thu Jun 30 22:03:16 2016
new/usr/src/uts/common/c2/audit_record.h
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.

new/usr/src/uts/common/exec/elf/elf.c
7029 want per-process exploit mitigation features (secflags)
7030 want basic address space layout randomization (aslr)
7031 noexec_user_stack should be a secflag
7032 want a means to forbid mappings around NULL.
