# Makefile.master, global definitions for system source
#
ROOT=           /proto

#
# Adjunct root, containing an additional proto area to be used for headers
# and libraries.
#
ADJUNCT_PROTO=

#
# Adjunct for building things that run on the build machine.
#
NATIVE_ADJUNCT= /usr

#
# RELEASE_BUILD should be cleared for final release builds.
# NOT_RELEASE_BUILD is exactly what the name implies.
#
# INTERNAL_RELEASE_BUILD is a subset of RELEASE_BUILD. It mostly controls
# identification strings. Enabling RELEASE_BUILD automatically enables
# INTERNAL_RELEASE_BUILD.
#
# STRIP_COMMENTS toggles comment section striping. Generally the same setting
# as INTERNAL_RELEASE_BUILD.
#
# __GNUC toggles the building of ON components using gcc and related tools.
# Normally set to '#', set it to '' to do gcc build.
#
# The declaration POUND_SIGN is always '#'. This is needed to get around the
# make feature that '#' is always a comment delimiter, even when escaped or
# quoted. We use this macro expansion method to get POUND_SIGN rather than
# always breaking out a shell because the general case can cause a noticable
```

```
# slowdown in build times when so many Makefiles include Makefile.master.
#
# While the majority of users are expected to override the setting below
# with an env file (via nightly or bldenv), if you aren't building that way
# (ie, you're using "ws" or some other bootstrapping method) then you need
# this definition in order to avoid the subshell invocation mentioned above.
#

PRE_POUND=                              pre\#

# The variables below control the compilers used during the build.
# There are a number of permutations.
#
# __GNUC and __SUNC control (and indicate) the primary compiler.  Whichever
# one is not POUND_SIGN is the primary, with the other as the shadow.  They
# may also be used to control entirely compiler-specific Makefile assignments.
# __SUNC and Sun Studio are the default.
#
# __GNUC64 indicates that the 64bit build should use the GNU C compiler.
# There is no Sun C analogue.
#
# The following version-specific options are operative regardless of which
# compiler is primary, and control the versions of the given compilers to be
# used.  They also allow compiler-version specific Makefile fragments.
#

#    POST_PROCESS_SO:   Post-processing for '.so' files.
#    POST_PROCESS:      Post-processing for executable files (no suffix).
# Note that these macros are not completely generalized as they are to be
# used with the file name to be processed following.
#
# It is left as an exercise to Release Engineering to embellish the generation
# of the release comment string.
#
#       If this is a standard development build:
#               compress the comment section (mcs -c)
#               add the standard comment (mcs -a $(RELEASE_CM))
#               add the development specific comment (mcs -a $(DEV_CM))
#
#       If this is an installation build:
#               delete the comment section (mcs -d)
#               add the standard comment (mcs -a $(RELEASE_CM))
#               add the development specific comment (mcs -a $(DEV_CM))
#
#       If this is an release build:
#               delete the comment section (mcs -d)
#               add the standard comment (mcs -a $(RELEASE_CM))
#
# The following list of macros are used in the definition of RELEASE_CM
# which is used to label all binaries in the build:
#
#       RELEASE         Specific release of the build, eg: 5.2
#       RELEASE_MAJOR   Major version number part of $(RELEASE)
#       RELEASE_MINOR   Minor version number part of $(RELEASE)
#       VERSION         Version of the build (alpha, beta, Generic)
#       PATCHID         If this is a patch this value should contain
#                       the patchid value (eg: "Generic 100832-01"), otherwise
#                       it will be set to $(VERSION)
#       RELEASE_DATE    Date of the Release Build
#       PATCH_DATE      Date the patch was created, if this is blank it
#                       will default to the RELEASE_DATE
#

include ../Makefile.master

#
#       Note that the commands 'agents', 'lp', 'perl', and 'man' are first in
#       the list, violating alphabetical order.  This is because they are very
#       long-running and should be given the most wall-clock time for a
#       parallel build.
#
#       Commands in the FIRST_SUBDIRS list are built before starting the build
#       of other commands.  Currently this includes only 'isaexec' and
#       'platexec'.  This is necessary because $(ROOT)/usr/lib/isaexec or
#       $(ROOT)/usr/lib/platexec must exist when some other commands are built
#       because their 'make install' creates a hard link to one of them.
#
#       Commands are listed one per line so that TeamWare can auto-merge most
#       changes.
#

   1 ----------------------------------------
   2 18 December 2013. Summary of changes for version 20131218:
   2 27 May 2011. Summary of changes for version 20110527:

   4 Global note: The ACPI 5.0A specification was released this month. There
   5 are no changes needed for ACPICA since this release of ACPI is an
   6 errata/clarification release. The specification is available at
   7 acpi.info.
   4 This release is available at www.acpica.org/downloads

  10 1) ACPICA kernel-resident subsystem:

  12 Added validation of the XSDT root table if it is present. Some older
  13 platforms contain an XSDT that is ill-formed or otherwise invalid (such
  14 as containing some or all entries that are NULL pointers). This change
  15 adds a new function to validate the XSDT before actually using it. If the
  16 XSDT is found to be invalid, ACPICA will now automatically fall back to
  17 using the RSDT instead. Original implementation by Zhao Yakui. Ported to
  18 ACPICA and enhanced by Lv Zheng and Bob Moore.

  20 Added a runtime option to ignore the XSDT and force the use of the RSDT.
  21 This change adds a runtime option that will force ACPICA to use the RSDT
  22 instead of the XSDT (AcpiGbl_DoNotUseXsdt). Although the ACPI spec
  23 requires that an XSDT be used instead of the RSDT, the XSDT has been
  24 found to be corrupt or ill-formed on some machines. Lv Zheng.

  26 Added a runtime option to favor 32-bit FADT register addresses over the
  27 64-bit addresses. This change adds an option to favor 32-bit FADT
  28 addresses when there is a conflict between the 32-bit and 64-bit versions
  29 of the same register. The default behavior is to use the 64-bit version
  30 in accordance with the ACPI specification. This can now be overridden via
  31 the AcpiGbl_Use32BitFadtAddresses flag. ACPICA BZ 885. Lv Zheng.

  33 During the change above, the internal "Convert FADT" and "Verify FADT"
  34 functions have been merged to simplify the code, making it easier to
  35 understand and maintain. ACPICA BZ 933.

  37 Improve exception reporting and handling for GPE block installation.
  38 Return an actual status from AcpiEvGetGpeXruptBlock and don't clobber the
  39 status when exiting AcpiEvInstallGpeBlock. ACPICA BZ 1019.

  41 Added helper macros to extract bus/segment numbers from the HEST table.
  42 This change adds two macros to extract the encoded bus and segment
  43 numbers from the HEST Bus field - ACPI_HEST_BUS and ACPI_HEST_SEGMENT.
  44 Betty Dall <betty.dall@hp.com>

  46 Removed the unused ACPI_FREE_BUFFER macro. This macro is no longer used
  47 by ACPICA. It is not a public macro, so it should have no effect on
  48 existing OSV code. Lv Zheng.

  50 Example Code and Data Size: These are the sizes for the OS-independent
  51 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
  52 debug version of the code includes the debug output trace mechanism and
  53 has a much larger code and data size.

  55   Current Release:
```

```
  56     Non-Debug Version:  96.1K Code, 27.0K Data, 123.1K Total
  57     Debug Version:     185.6K Code, 77.3K Data, 262.9K Total
  58   Previous Release:
  59     Non-Debug Version:  95.9K Code, 27.0K Data, 122.9K Total
  60     Debug Version:     185.1K Code, 77.2K Data, 262.3K Total

  63 2) iASL Compiler/Disassembler and Tools:

  65 Disassembler: Improved pathname support for emitted External()
  66 statements. This change adds full pathname support for external names
  67 that have been resolved internally by the inclusion of additional ACPI
  68 tables (via the iASL -e option). Without this change, the disassembler
  69 can emit multiple externals for the same object, or it become confused
  70 when the Scope() operator is used on an external object. Overall, greatly
  71 improves the ability to actually recompile the emitted ASL code when
  72 objects a referenced across multiple ACPI tables. Reported by Michael
  73 Tsirkin (mst@redhat.com).

  75 Tests/ASLTS: Updated functional control suite to execute with no errors.
  76 David Box. Fixed several errors related to the testing of the interpreter
  77 slack mode. Lv Zheng.

  79 iASL: Added support to detect names that are declared within a control
  80 method, but are unused (these are temporary names that are only valid
  81 during the time the method is executing). A remark is issued for these
  82 cases. ACPICA BZ 1022.

  84 iASL: Added full support for the DBG2 table. Adds full disassembler,
  85 table compiler, and template generator support for the DBG2 table (Debug
  86 Port 2 table).

  88 iASL: Added full support for the PCCT table, update the table definition.
  89 Updates the PCCT table definition in the actbl3.h header and adds table
  90 compiler and template generator support.

  92 iASL: Added an option to emit only error messages (no warnings/remarks).
  93 The -ve option will enable only error messages, warnings and remarks are
  94 suppressed. This can simplify debugging when only the errors are
  95 important, such as when an ACPI table is disassembled and there are many
  96 warnings and remarks -- but only the actual errors are of real interest.

  98 Example ACPICA code (source/tools/examples): Updated the example code so
  99 that it builds to an actual working program, not just example code. Added
 100 ACPI tables and execution of an example control method in the DSDT. Added
 101 makefile support for Unix generation.

 103 ----------------------------------------
 104 15 November 2013. Summary of changes for version 20131115:

 106 This release is available at https://acpica.org/downloads

 109 1) ACPICA kernel-resident subsystem:

 111 Resource Manager: Fixed loop termination for the "get AML length"
 112 function. The loop previously had an error termination on a NULL resource
 113 pointer, which can never happen since the loop simply increments a valid
 114 resource pointer. This fix changes the loop to terminate with an error on
 115 an invalid end-of-buffer condition. The problem can be seen as an
 116 infinite loop by callers to AcpiSetCurrentResources with an invalid or
 117 corrupted resource descriptor, or a resource descriptor that is missing
 118 an END_TAG descriptor. Reported by Dan Carpenter
 119 <dan.carpenter@oracle.com>. Lv Zheng, Bob Moore.

 121 Table unload and ACPICA termination: Delete all attached data objects
```

during namespace node deletion. This fix updates namespace node deletion to delete the entire list of attached objects (attached via AcpiAttachObject) instead of just one of the attached items. ACPICA BZ 1024. Tomasz Nowicki (tomasz.nowicki@linaro.org).

ACPICA termination: Added support to delete all objects attached to the root namespace node. This fix deletes any and all objects that have been attached to the root node via AcpiAttachData. Previously, none of these objects were deleted. Reported by Tomasz Nowicki. ACPICA BZ 1026.

Debug output: Do not emit the function nesting level for the in-kernel build. The nesting level is really only useful during a single-thread execution. Therefore, only enable this output for the AcpiExec utility. Also, only emit the thread ID when executing under AcpiExec (Context switches are still always detected and a message is emitted). ACPICA BZ 972.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Current Release:
    Non-Debug Version:  95.9K Code, 27.0K Data, 122.9K Total
    Debug Version:     185.1K Code, 77.2K Data, 262.3K Total
  Previous Release:
    Non-Debug Version:  95.8K Code, 27.0K Data, 122.8K Total
    Debug Version:     185.2K Code, 77.2K Data, 262.4K Total
```

2) iASL Compiler/Disassembler and Tools:

AcpiExec/Unix-OSL: Use <termios.h> instead of <termio.h>. This is the correct portable POSIX header for terminal control functions.

Disassembler: Fixed control method invocation issues related to the use of the CondRefOf() operator. The problem is seen in the disassembly where control method invocations may not be disassembled properly if the control method name has been used previously as an argument to CondRefOf. The solution is to not attempt to emit an external declaration for the CondRefOf target (it is not necessary in the first place). This prevents disassembler object type confusion. ACPICA BZ 988.

Unix Makefiles: Added an option to disable compiler optimizations and the _FORTIFY_SOURCE flag. Some older compilers have problems compiling ACPICA with optimizations (reportedly, gcc 4.4 for example). This change adds a command line option for make (NOOPT) that disables all compiler optimizations and the _FORTIFY_SOURCE compiler flag. The default optimization is -O2 with the _FORTIFY_SOURCE flag specified. ACPICA BZ 1034. Lv Zheng, Bob Moore.

Tests/ASLTS: Added options to specify individual test cases and modes. This allows testers running aslts.sh to optionally specify individual test modes and test cases. Also added an option to disable the forced generation of the ACPICA tools from source if desired. Lv Zheng.

---

27 September 2013. Summary of changes for version 20130927:

This release is available at https://acpica.org/downloads

1) ACPICA kernel-resident subsystem:

Fixed a problem with store operations to reference objects. This change fixes a problem where a Store operation to an ArgX object that contained a reference to a field object did not complete the automatic dereference and then write to the actual field object. Instead, the object type of the field object was inadvertently changed to match the type of the source operand. The new behavior will actually write to the field object (buffer field or field unit), thus matching the correct ACPI-defined behavior.

Implemented support to allow the host to redefine individual OSL prototypes. This change enables the host to redefine OSL prototypes found in the acpiosxf.h file. This allows the host to implement OSL interfaces with a macro or inlined function. Further, it allows the host to add any additional required modifiers such as __iomem, __init, __exit, etc., as necessary on a per-interface basis. Enables maximum flexibility for the OSL interfaces. Lv Zheng.

Hardcoded the access width for the FADT-defined reset register. The ACPI specification requires the reset register width to be 8 bits. ACPICA now hardcodes the width to 8 and ignores the FADT width value. This provides compatibility with other ACPI implementations that have allowed BIOS code with bad register width values to go unnoticed. Matthew Garett, Bob Moore,
Lv Zheng.

Changed the position/use of the ACPI_PRINTF_LIKE macro. This macro is used in the OSL header (acpiosxf). The change modifies the position of this macro in each instance where it is used (AcpiDebugPrint, etc.) to avoid build issues if the OSL defines the implementation of the interface to be an inline stub function. Lv Zheng.

Deployed a new macro ACPI_EXPORT_SYMBOL_INIT for the main ACPICA initialization interfaces. This change adds a new macro for the main init and terminate external interfaces in order to support hosts that require additional or different processing for these functions. Changed from ACPI_EXPORT_SYMBOL to ACPI_EXPORT_SYMBOL_INIT for these functions. Lv Zheng, Bob Moore.

Cleaned up the memory allocation macros for configurability. In the common case, the ACPI_ALLOCATE and related macros now resolve directly to their respective AcpiOs* OSL interfaces. Two options:
1) The ACPI_ALLOCATE_ZEROED macro uses a simple local implementation by default, unless overridden by the USE_NATIVE_ALLOCATE_ZEROED define.
2) For AcpiExec (and for debugging), the macros can optionally be resolved to the local ACPICA interfaces that track each allocation (local tracking is used to immediately detect memory leaks).
Lv Zheng.

Simplified the configuration for ACPI_REDUCED_HARDWARE. Allows the kernel to predefine this macro to either TRUE or FALSE during the system build.

Replaced __FUNCTION_ with __func__ in the gcc-specific header.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Current Release:
    Non-Debug Version:  95.8K Code, 27.0K Data, 122.8K Total
    Debug Version:     185.2K Code, 77.2K Data, 262.4K Total
  Previous Release:
    Non-Debug Version:  96.7K Code, 27.1K Data, 123.9K Total
    Debug Version:     184.4K Code, 76.8K Data, 261.2K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented wildcard support for the -e option. This simplifies use when there are many SSDTs that must be included to resolve external method declarations. ACPICA BZ 1041. Example:

```
iasl -e ssdt*.dat -d dsdt.dat
```

AcpiExec: Add history/line-editing for Unix/Linux systems. This change adds a portable module that implements full history and limited line editing for Unix and Linux systems. It does not use readline() due to portability issues. Instead it uses the POSIX termio interface to put the terminal in raw input mode so that the various special keys can be trapped (such as up/down-arrow for history support and left/right-arrow for line editing). Uses the existing debugger history mechanism. ACPICA BZ 1036.

AcpiXtract: Add support to handle (ignore) "empty" lines containing only one or more spaces. This provides compatible with early or different versions of the AcpiDump utility. ACPICA BZ 1044.

AcpiDump: Do not ignore tables that contain only an ACPI table header. Apparently, some BIOSs create SSDTs that contain an ACPI table header but no other data. This change adds support to dump these tables. Any tables shorter than the length of an ACPI table header remain in error (an error message is emitted). Reported by Yi Li.

Debugger: Echo actual command along with the "unknown command" message.

---

23 August 2013. Summary of changes for version 20130823:

1) ACPICA kernel-resident subsystem:

Implemented support for host-installed System Control Interrupt (SCI) handlers. Certain ACPI functionality requires the host to handle raw SCIs. For example, the "SCI Doorbell" that is defined for memory power state support requires the host device driver to handle SCIs to examine if the doorbell has been activated. Multiple SCI handlers can be installed to allow for future expansion. New external interfaces are AcpiInstallSciHandler, AcpiRemoveSciHandler; see the ACPICA reference for details. Lv Zheng, Bob Moore. ACPICA BZ 1032.

Operation region support: Never locally free the handler "context" pointer. This change removes some dangerous code that attempts to free the handler context pointer in some (rare) circumstances. The owner of the handler owns this pointer and the ACPICA code should never touch it. Although not seen to be an issue in any kernel, it did show up as a problem (fault) under AcpiExec. Also, set the internal storage field for the context pointer to zero when the region is deactivated, simply for sanity. David Box. ACPICA BZ 1039.

AcpiRead: On error, do not modify the return value target location. If an error happens in the middle of a split 32/32 64-bit I/O operation, do not modify the target of the return value pointer. Makes the code consistent with the rest of ACPICA. Bjorn Helgaas.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Current Release:
    Non-Debug Version:  96.7K Code, 27.1K Data, 123.9K Total
```

```
    Debug Version:     184.4K Code, 76.8K Data, 261.2K Total
  Previous Release:
    Non-Debug Version:  96.2K Code, 27.1K Data, 123.3K Total
    Debug Version:     185.4K Code, 77.1K Data, 262.5K Total
```

2) iASL Compiler/Disassembler and Tools:

AcpiDump: Implemented several new features and fixed some problems:
1) Added support to dump the RSDP, RSDT, and XSDT tables.
2) Added support for multiple table instances (SSDT, UEFI).
3) Added option to dump "customized" (overridden) tables (-c).
4) Fixed a problem where some table filenames were improperly constructed.
5) Improved some error messages, removed some unnecessary messages.

iASL: Implemented additional support for disassembly of ACPI tables that contain invocations of external control methods. The -fe<file> option allows the import of a file that specifies the external methods along with the required number of arguments for each -- allowing for the correct disassembly of the table. This is a workaround for a limitation of AML code where the disassembler often cannot determine the number of arguments required for an external control method and generates incorrect ASL code. See the iASL reference for details. ACPICA BZ 1030.

Debugger: Implemented a new command (paths) that displays the full pathnames (namepaths) and object types of all objects in the namespace. This is an alternative to the namespace command.

Debugger: Implemented a new command (sci) that invokes the SCI dispatch mechanism and any installed handlers.

iASL: Fixed a possible segfault for "too many parent prefixes" condition. This can occur if there are too many parent prefixes in a namepath (for example, ^^^^^^PCI0.ECRD). ACPICA BZ 1035.

Application OSLs: Set the return value for the PCI read functions. These functions simply return AE_OK, but should set the return value to zero also. This change implements this. ACPICA BZ 1038.

Debugger: Prevent possible command line buffer overflow. Increase the size of a couple of the debugger line buffers, and ensure that overflow cannot happen. ACPICA BZ 1037.

iASL: Changed to abort immediately on serious errors during the parsing phase. Due to the nature of ASL, there is no point in attempting to compile these types of errors, and they typically end up causing a cascade of hundreds of errors which obscure the original problem.

---

25 July 2013. Summary of changes for version 20130725:

1) ACPICA kernel-resident subsystem:

Fixed a problem with the DerefOf operator where references to FieldUnits and BufferFields incorrectly returned the parent object, not the actual value of the object. After this change, a dereference of a FieldUnit reference results in a read operation on the field to get the value, and likewise, the appropriate BufferField value is extracted from the target buffer.

Fixed a problem where the _WAK method could cause a fault under these circumstances: 1) Interpreter slack mode was not enabled, and 2) the _WAK method returned no value. The problem is rarely seen because most kernels run ACPICA in slack mode.

For the DerefOf operator, a fatal error now results if an attempt is made
to dereference a reference (created by the Index operator) to a NULL
package element. Provides compatibility with other ACPI implementations,
and this behavior will be added to a future version of the ACPI
specification.

The ACPI Power Management Timer (defined in the FADT) is now optional.
This provides compatibility with other ACPI implementations and will
appear in the next version of the ACPI specification. If there is no PM
Timer on the platform, AcpiGetTimer returns AE_SUPPORT. An address of
zero in the FADT indicates no PM timer.

Implemented a new interface for _OSI support, AcpiUpdateInterfaces. This
allows the host to globally enable/disable all vendor strings, all
feature strings, or both. Intended to be primarily used for debugging
purposes only. Lv Zheng.

Expose the collected _OSI data to the host via a global variable. This
data tracks the highest level vendor ID that has been invoked by the BIOS
so that the host (and potentially ACPICA itself) can change behaviors
based upon the age of the BIOS.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

```
  Current Release:
    Non-Debug Version:  96.2K Code, 27.1K Data, 123.3K Total
    Debug Version:     184.4K Code, 76.8K Data, 261.2K Total
  Previous Release:
    Non-Debug Version:  95.9K Code, 26.9K Data, 122.8K Total
    Debug Version:     184.1K Code, 76.7K Data, 260.8K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Created the following enhancements for the -so option (create
offset table):
1)Add offsets for the last nameseg in each namepath for every supported
object type
2)Add support for Processor, Device, Thermal Zone, and Scope objects
3)Add the actual AML opcode for the parent object of every supported
object type
4)Add support for the ZERO/ONE/ONES AML opcodes for integer objects

Disassembler: Emit all unresolved external symbols in a single block.
These are external references to control methods that could not be
resolved, and thus, the disassembler had to make a guess at the number of
arguments to parse.

iASL: The argument to the -T option (create table template) is now
optional. If not specified, the default table is a DSDT, typically the
most common case.

---

26 June 2013. Summary of changes for version 20130626:

1) ACPICA kernel-resident subsystem:

Fixed an issue with runtime repair of the _CST object. Null or invalid
elements were not always removed properly. Lv Zheng.

Removed an arbitrary restriction of 256 GPEs per GPE block (such as the
FADT-defined GPE0 and GPE1). For GPE0, GPE1, and each GPE Block Device,
the maximum number of GPEs is 1016. Use of multiple GPE block devices

makes the system-wide number of GPEs essentially unlimited.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

```
  Current Release:
    Non-Debug Version:  95.9K Code, 26.9K Data, 122.8K Total
    Debug Version:     184.1K Code, 76.7K Data, 260.8K Total
  Previous Release:
    Non-Debug Version:  96.0K Code, 27.0K Data, 123.0K Total
    Debug Version:     184.1K Code, 76.8K Data, 260.9K Total
```

2) iASL Compiler/Disassembler and Tools:

Portable AcpiDump: Implemented full support for the Linux and FreeBSD
hosts. Now supports Linux, FreeBSD, and Windows.

Disassembler: Added some missing types for the HEST and EINJ tables: "Set
Error Type With Address", "CMCI", "MCE", and "Flush Cacheline".

iASL/Preprocessor: Implemented full support for nested
#if/#else/#elif/#endif blocks. Allows arbitrary depth of nested blocks.

Disassembler: Expanded maximum output string length to 64K. Was 256 bytes
max. The original purpose of this constraint was to limit the amount of
debug output. However, the string function in question (UtPrintString) is
now used for the disassembler also, where 256 bytes is insufficient.
Reported by RehabMan@GitHub.

iASL/DataTables: Fixed some problems and issues with compilation of DMAR
tables. ACPICA BZ 999. Lv Zheng.

iASL: Fixed a couple of error exit issues that could result in a "Could
not delete <file>" message during ASL compilation.

AcpiDump: Allow "FADT" and "MADT" as valid table signatures, even though
the actual signatures for these tables are "FACP" and "APIC",
respectively.

AcpiDump: Added support for multiple UEFI tables. Only SSDT and UEFI
tables are allowed to have multiple instances.

---

17 May 2013. Summary of changes for version 20130517:

1) ACPICA kernel-resident subsystem:

Fixed a regression introduced in version 20130328 for _INI methods. This
change fixes a problem introduced in 20130328 where _INI methods are no
longer executed properly because of a memory block that was not
initialized correctly. ACPICA BZ 1016. Tomasz Nowicki
<tomasz.nowicki@linaro.org>.

Fixed a possible problem with the new extended sleep registers in the
ACPI
5.0 FADT. Do not use these registers (even if populated) unless the HW-
reduced bit is set in the FADT (as per the ACPI specification). ACPICA BZ
1020. Lv Zheng.

Implemented return value repair code for _CST predefined objects: Sort
the
list and detect/remove invalid entries. ACPICA BZ 890. Lv Zheng.

Implemented a debug-only option to disable loading of SSDTs from the
RSDT/XSDT during ACPICA initialization. This can be useful for debugging
ACPI problems on some machines. Set AcpiGbl_DisableSsdtTableLoad in
acglobal.h - ACPICA BZ 1005. Lv Zheng.

Fixed some issues in the ACPICA initialization and termination code:
Tomasz Nowicki <tomasz.nowicki@linaro.org>
1) Clear events initialized flag upon event component termination. ACPICA
BZ 1013.
2) Fixed a possible memory leak in GPE init error path. ACPICA BZ 1018.
3) Delete global lock pending lock during termination. ACPICA BZ 1012.
4) Clear debug buffer global on termination to prevent possible multiple
delete. ACPICA BZ 1010.

Standardized all switch() blocks across the entire source base. After
many
years, different formatting for switch() had crept in. This change makes
the formatting of every switch block identical. ACPICA BZ 997. Chao Guan.

Split some files to enhance ACPICA modularity and configurability:
1) Split buffer dump routines into utilities/utbuffer.c
2) Split internal error message routines into utilities/uterror.c
3) Split table print utilities into tables/tbprint.c
4) Split iASL command-line option processing into asloptions.c

Makefile enhancements:
1) Support for all new files above.
2) Abort make on errors from any subcomponent. Chao Guan.
3) Add build support for Apple Mac OS X. Liang Qi.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

  Current Release:
    Non-Debug Version: 96.0K Code, 27.0K Data, 123.0K Total
    Debug Version: 184.1K Code, 76.8K Data, 260.9K Total
  Previous Release:
    Non-Debug Version: 95.6K Code, 26.8K Data, 122.4K Total
    Debug Version: 183.5K Code, 76.6K Data, 260.1K Total

2) iASL Compiler/Disassembler and Tools:

New utility: Implemented an easily portable version of the acpidump
utility to extract ACPI tables from the system (or a file) in an ASCII
hex
dump format. The top-level code implements the various command line
options, file I/O, and table dump routines. To port to a new host, only
three functions need to be implemented to get tables -- since this
functionality is OS-dependent. See the tools/acpidump/apmain.c module and
the ACPICA reference for porting instructions. ACPICA BZ 859. Notes:
1) The Windows version obtains the ACPI tables from the Registry.
2) The Linux version is under development.
3) Other hosts - If an OS-dependent module is submitted, it will be
distributed with ACPICA.

iASL: Fixed a regression for -D preprocessor option (define symbol). A
restructuring/change to the initialization sequence caused this option to
no longer work properly.

iASL: Implemented a mechanism to disable specific warnings and remarks.
Adds a new command line option, "-vw <messageid> as well as "#pragma
disable <messageid>". ACPICA BZ 989. Chao Guan, Bob Moore.

iASL: Fix for too-strict package object validation. The package object
validation for return values from the predefined names is a bit too
strict, it does not allow names references within the package (which will
be resolved at runtime.) These types of references cannot be validated at
compile time. This change ignores named references within package objects
for names that return or define static packages.

Debugger: Fixed the 80-character command line limitation for the History
command. Now allows lines of arbitrary length. ACPICA BZ 1000. Chao Guan.

iASL: Added control method and package support for the -so option
(generates AML offset table for BIOS support.)

iASL: issue a remark if a non-serialized method creates named objects. If
a thread blocks within the method for any reason, and another thread
enters the method, the method will fail because an attempt will be made
to
create the same (named) object twice. In this case, issue a remark that
the method should be marked serialized. NOTE: may become a warning later.
ACPICA BZ 909.

----
18 April 2013. Summary of changes for version 20130418:

1) ACPICA kernel-resident subsystem:

Fixed a possible buffer overrun during some rare but specific field unit
read operations. This overrun can only happen if the DSDT version is 1 --
meaning that all AML integers are 32 bits -- and the field length is
between 33 and 55 bits long. During the read, an internal buffer object
is
created for the field unit because the field is larger than an integer
(32
bits). However, in this case, the buffer will be incorrectly written
beyond the end because the buffer length is less than the internal
minimum
of 64 bits (8 bytes) long. The buffer will be either 5, 6, or 7 bytes
long, but a full 8 bytes will be written.

Updated the Embedded Controller "orphan" _REG method support. This refers
to _REG methods under the EC device that have no corresponding operation
region. This is allowed by the ACPI specification. This update removes a
dependency on the existence an ECDT table. It will execute an orphan _REG
method as long as the operation region handler for the EC is installed at
the EC device node and not the namespace root. Rui Zhang (original
update), Bob Moore (update/integrate).

Implemented run-time argument typechecking for all predefined ACPI names
(_STA, _BIF, etc.) This change performs object typechecking on all
incoming arguments for all predefined names executed via
AcpiEvaluateObject. This ensures that ACPI-related device drivers are
passing correct object types as well as the correct number of arguments
(therefore identifying any issues immediately). Also, the ASL/namespace
definition of the predefined name is checked against the ACPI
specification for the proper argument count. Adds one new file,
nsarguments.c

Changed an exception code for the ASL UnLoad() operator. Changed the
exception code for the case where the input DdbHandle is invalid, from
AE_BAD_PARAMETER to the more appropriate AE_AML_OPERAND_TYPE.

Unix/Linux makefiles: Removed the use of the -O2 optimization flag in the
global makefile. The use of this flag causes compiler errors on earlier
versions of GCC, so it has been removed for compatibility.

Miscellaneous cleanup:

```
1) Removed some unused/obsolete macros
2) Fixed a possible memory leak in the _OSI support
3) Removed an unused variable in the predefined name support
4) Windows OSL: remove obsolete reference to a memory list field

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

  Current Release:
    Non-Debug Version:  95.2K Code, 26.4K Data, 121.6K Total
    Debug Version:     183.0K Code, 76.0K Data, 259.0K Total
  Previous Release:
    Non-Debug Version:  95.6K Code, 26.8K Data, 122.4K Total
    Debug Version:     183.5K Code, 76.6K Data, 260.1K Total

2) iASL Compiler/Disassembler and Tools:

AcpiExec: Added installation of a handler for the SystemCMOS address
space. This prevents control method abort if a method accesses this
space.

AcpiExec: Added support for multiple EC devices, and now install EC
operation region handler(s) at the actual EC device instead of the
namespace root. This reflects the typical behavior of host operating
systems.

AcpiExec: Updated to ensure that all operation region handlers are
installed before the _REG methods are executed. This prevents a _REG
method from aborting if it accesses an address space has no handler.
AcpiExec installs a handler for every possible address space.

Debugger: Enhanced the "handlers" command to display non-root handlers.
This change enhances the handlers command to display handlers associated
with individual devices throughout the namespace, in addition to the
currently supported display of handlers associated with the root
namespace
node.

ASL Test Suite: Several test suite errors have been identified and
resolved, reducing the total error count during execution. Chao Guan.

---------------------------------------
28 March 2013. Summary of changes for version 20130328:

1) ACPICA kernel-resident subsystem:

Fixed several possible race conditions with the internal object reference
counting mechanism. Some of the external ACPICA interfaces update object
reference counts without holding the interpreter or namespace lock. This
change adds a spinlock to protect reference count updates on the internal
ACPICA objects. Reported by and with assistance from Andriy Gapon
(avg@FreeBSD.org).

FADT support: Removed an extraneous warning for very large GPE register
sets. This change removes a size mismatch warning if the legacy length
field for a GPE register set is larger than the 64-bit GAS structure can
accommodate. GPE register sets can be larger than the 255-bit width
limitation of the GAS structure. Linn Crosetto (linn@hp.com).

_OSI Support: handle any errors from AcpiOsAcquireMutex. Check for error
return from this interface. Handles a possible timeout case if
ACPI_WAIT_FOREVER is modified by the host to be a value less than
"forever". Jung-uk Kim.
```

```
Predefined name support: Add allowed/required argument type information
to
the master predefined info table. This change adds the infrastructure to
enable typechecking on incoming arguments for all predefined
methods/objects. It does not actually contain the code that will fully
utilize this information, this is still under development. Also condenses
some duplicate code for the predefined names into a new module,
utilities/utpredef.c

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

  Previous Release:
    Non-Debug Version:  95.0K Code, 25.9K Data, 120.9K Total
    Debug Version:     182.9K Code, 75.6K Data, 258.5K Total
  Current Release:
    Non-Debug Version:  95.2K Code, 26.4K Data, 121.6K Total
    Debug Version:     183.0K Code, 76.0K Data, 259.0K Total

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented a new option to simplify the development of ACPI-
related
BIOS code. Adds support for a new "offset table" output file. The -so
option will create a C table containing the AML table offsets of various
named objects in the namespace so that BIOS code can modify them easily
at
boot time. This can simplify BIOS runtime code by eliminating expensive
searches for "magic values", enhancing boot times and adding greater
reliability. With assistance from Lee Hamel.

iASL: Allow additional predefined names to return zero-length packages.
Now, all predefined names that are defined by the ACPI specification to
return a "variable-length package of packages" are allowed to return a
zero length top-level package. This allows the BIOS to tell the host that
the requested feature is not supported, and supports existing BIOS/ASL
code and practices.

iASL: Changed the "result not used" warning to an error. This is the case
where an ASL operator is effectively a NOOP because the result of the
operation is not stored anywhere. For example:
    Add (4, Local0)
There is no target (missing 3rd argument), nor is the function return
value used. This is potentially a very serious problem -- since the code
was probably intended to do something, but for whatever reason, the value
was not stored. Therefore, this issue has been upgraded from a warning to
an error.

AcpiHelp: Added allowable/required argument types to the predefined names
info display. This feature utilizes the recent update to the predefined
names table (above).

---------------------------------------
14 February 2013. Summary of changes for version 20130214:

1) ACPICA Kernel-resident Subsystem:

Fixed a possible regression on some hosts: Reinstated the safe return
macros (return_ACPI_STATUS, etc.) that ensure that the argument is
evaluated only once. Although these macros are not needed for the ACPICA
code itself, they are often used by ACPI-related host device drivers
where
```

```
the safe feature may be necessary.

Fixed several issues related to the ACPI 5.0 reduced hardware support
(SOC): Now ensure that if the platform declares itself as hardware-
reduced
via the FADT, the following functions become NOOPs (and always return
AE_OK) because ACPI is always enabled by definition on these machines:
  AcpiEnable
  AcpiDisable
  AcpiHwGetMode
  AcpiHwSetMode

Dynamic Object Repair: Implemented additional runtime repairs for
predefined name return values. Both of these repairs can simplify code in
the related device drivers that invoke these methods:
1) For the _STR and _MLS names, automatically repair/convert an ASCII
string to a Unicode buffer.
2) For the _CRS, _PRS, and _DMA names, return a resource descriptor with
a
lone end tag descriptor in the following cases: A Return(0) was executed,
a null buffer was returned, or no object at all was returned (non-slack
mode only). Adds a new file, nsconvert.c
ACPICA BZ 998. Bob Moore, Lv Zheng.

Resource Manager: Added additional code to prevent possible infinite
loops
while traversing corrupted or ill-formed resource template buffers. Check
for zero-length resource descriptors in all code that loops through
resource templates (the length field is used to index through the
template). This change also hardens the external AcpiWalkResources and
AcpiWalkResourceBuffer interfaces.

Local Cache Manager: Enhanced the main data structure to eliminate an
unnecessary mechanism to access the next object in the list. Actually
provides a small performance enhancement for hosts that use the local
ACPICA cache manager. Jung-uk Kim.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

  Previous Release:
    Non-Debug Version:  94.5K Code, 25.4K Data, 119.9K Total
    Debug Version:     182.3K Code, 75.0K Data, 257.3K Total
  Current Release:
    Non-Debug Version:  95.0K Code, 25.9K Data, 120.9K Total
    Debug Version:     182.9K Code, 75.6K Data, 258.5K Total

2) iASL Compiler/Disassembler and Tools:

iASL/Disassembler: Fixed several issues with the definition of the ACPI
5.0 RASF table (RAS Feature Table). This change incorporates late changes
that were made to the ACPI 5.0 specification.

iASL/Disassembler: Added full support for the following new ACPI tables:
  1) The MTMR table (MID Timer Table)
  2) The VRTC table (Virtual Real Time Clock Table).
Includes header file, disassembler, table compiler, and template support
for both tables.

iASL: Implemented compile-time validation of package objects returned by
predefined names. This new feature validates static package objects
returned by the various predefined names defined to return packages. Both
object types and package lengths are validated, for both parent packages
```

```
and sub-packages, if any. The code is similar in structure and behavior
to
the runtime repair mechanism within the AML interpreter and uses the
existing predefined name information table. Adds a new file, aslprepkg.c.
ACPICA BZ 938.

iASL: Implemented auto-detection of binary ACPI tables for disassembly.
This feature detects a binary file with a valid ACPI table header and
invokes the disassembler automatically. Eliminates the need to
specifically invoke the disassembler with the -d option. ACPICA BZ 862.

iASL/Disassembler: Added several warnings for the case where there are
unresolved control methods during the disassembly. This can potentially
cause errors when the output file is compiled, because the disassembler
assumes zero method arguments in these cases (it cannot determine the
actual number of arguments without resolution/definition of the method).

Debugger: Added support to display all resources with a single command.
Invocation of the resources command with no arguments will now display
all
resources within the current namespace.

AcpiHelp: Added descriptive text for each ACPICA exception code displayed
via the -e option.

----------------------------------------
17 January 2013. Summary of changes for version 20130117:

1) ACPICA Kernel-resident Subsystem:

Updated the AcpiGetSleepTypeData interface: Allow the \_Sx methods to
return either 1 or 2 integers. Although the ACPI spec defines the \_Sx
objects to return a package containing one integer, most BIOS code
returns
two integers and the previous code reflects that. However, we also need
to
support BIOS code that actually implements to the ACPI spec, and this
change reflects this.

Fixed two issues with the ACPI_DEBUG_PRINT macros:
1) Added the ACPI_DO_WHILE macro to the main DEBUG_PRINT helper macro for
C compilers that require this support.
2) Renamed the internal ACPI_DEBUG macro to ACPI_DO_DEBUG_PRINT since
ACPI_DEBUG is already used by many of the various hosts.

Updated all ACPICA copyrights and signons to 2013. Added the 2013
copyright to all module headers and signons, including the standard Linux
header. This affects virtually every file in the ACPICA core subsystem,
iASL compiler, all ACPICA utilities, and the test suites.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a much larger code and data size.

  Previous Release:
    Non-Debug Version:  94.5K Code, 25.5K Data, 120.0K Total
    Debug Version:     182.2K Code, 74.9K Data, 257.1K Total
  Current Release:
    Non-Debug Version:  94.5K Code, 25.4K Data, 119.9K Total
    Debug Version:     182.3K Code, 75.0K Data, 257.3K Total

2) iASL Compiler/Disassembler and Tools:

Generic Unix OSL: Use a buffer to eliminate multiple vfprintf()s and
```

prevent a possible fault on some hosts. Some C libraries modify the arg pointer parameter to vfprintf making it difficult to call it twice in the AcpiOsVprintf function. Use a local buffer to workaround this issue. This does not affect the Windows OSL since the Win C library does not modify the arg pointer. Chao Guan, Bob Moore.

iASL: Fixed a possible infinite loop when the maximum error count is reached. If an output file other than the .AML file is specified (such as a listing file), and the maximum number of errors is reached, do not attempt to flush data to the output file(s) as the compiler is aborting. This can cause an infinite loop as the max error count code essentially keeps calling itself.

iASL/Disassembler: Added an option (-in) to ignore NOOP opcodes/operators. Implemented for both the compiler and the disassembler. Often, the NOOP opcode is used as padding for packages that are changed dynamically by the BIOS. When disassembled and recompiled, these NOOPs will cause syntax errors. This option causes the disassembler to ignore all NOOP opcodes (0xA3), and it also causes the compiler to ignore all ASL source code NOOP statements as well.

Debugger: Enhanced the Sleep command to execute all sleep states. This change allows Sleep to be invoked with no arguments and causes the debugger to execute all of the sleep states, 0-5, automatically.

---

20 December 2012. Summary of changes for version 20121220:

1) ACPICA Kernel-resident Subsystem:

Implemented a new interface, AcpiWalkResourceBuffer. This interface is an alternate entry point for AcpiWalkResources and improves the usability of the resource manager by accepting as input a buffer containing the output of either a _CRS, _PRS, or _AEI method. The key functionality is that the input buffer is not deleted by this interface so that it can be used by the host later. See the ACPICA reference for details.

Interpreter: Add a warning if a 64-bit constant appears in a 32-bit table (DSDT version < 2). The constant will be truncated and this warning reflects that behavior.

Resource Manager: Add support for the new ACPI 5.0 wake bit in the IRQ, ExtendedInterrupt, and GpioInt descriptors. This change adds support to both get and set the new wake bit in these descriptors, separately from the existing share bit. Reported by Aaron Lu.

Interpreter: Fix Store() when an implicit conversion is not possible. For example, in the cases such as a store of a string to an existing package object, implement the store as a CopyObject(). This is a small departure from the ACPI specification which states that the control method should be aborted in this case. However, the ASLTS suite depends on this behavior.

Performance improvement for the various FUNCTION_TRACE and DEBUG_PRINT macros: check if debug output is currently enabled as soon as possible to minimize performance impact if debug is in fact not enabled.

Source code restructuring: Cleanup to improve modularity. The following new files have been added: dbconvert.c, evhandler.c, nsprepkg.c, psopinfo.c, psobject.c, rsdumpinfo.c, utstring.c, and utownerid.c. Associated makefiles and project files have been updated.

Changed an exception code for LoadTable operator. For the case where one

of the input strings is too long, change the returned exception code from AE_BAD_PARAMETER to AE_AML_STRING_LIMIT.

Fixed a possible memory leak in dispatcher error path. On error, delete the mutex object created during method mutex creation. Reported by tim.gardner@canonical.com.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  94.3K Code, 25.3K Data, 119.6K Total
    Debug Version:     175.5K Code, 74.5K Data, 250.0K Total
  Current Release:
    Non-Debug Version:  94.5K Code, 25.5K Data, 120.0K Total
    Debug Version:     182.2K Code, 74.9K Data, 257.1K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Disallow a method call as argument to the ObjectType ASL operator. This change tracks an errata to the ACPI 5.0 document. The AML grammar will not allow the interpreter to differentiate between a method and a method invocation when these are used as an argument to the ObjectType operator. The ACPI specification change is to disallow a method invocation (UserTerm) for the ObjectType operator.

Finish support for the TPM2 and CSRT tables in the headers, table compiler, and disassembler.

Unix user-space OSL: Fix a problem with WaitSemaphore where the timeout always expires immediately if the semaphore is not available. The original code was using a relative-time timeout, but sem_timedwait requires the use of an absolute time.

iASL: Added a remark if the Timer() operator is used within a 32-bit table. This operator returns a 64-bit time value that will be truncated within a 32-bit table.

iASL Source code restructuring: Cleanup to improve modularity. The following new files have been added: aslhex.c, aslxref.c, aslnamesp.c, aslmethod.c, and aslfileio.c. Associated makefiles and project files have been updated.

---

14 November 2012. Summary of changes for version 20121114:

1) ACPICA Kernel-resident Subsystem:

Implemented a performance enhancement for ACPI/AML Package objects. This change greatly increases the performance of Package objects within the interpreter. It changes the processing of reference counts for packages by optimizing for the most common case where the package sub-objects are either Integers, Strings, or Buffers. Increases the overall performance of the ASLTS test suite by 1.5X (Increases the Slack Mode performance by 2X.) Chao Guan. ACPICA BZ 943.

Implemented and deployed common macros to extract flag bits from resource descriptors. Improves readability and maintainability of the code. Fixes a problem with the UART serial bus descriptor for the number of data bits flags (was incorrectly 2 bits, should be 3).

Enhanced the ACPI_GETx and ACPI_SETx macros. Improved the implementation of the macros and changed the SETx macros to the style of (destination, source). Also added ACPI_CASTx companion macros. Lv Zheng.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  93.9K Code, 25.2K Data, 119.1K Total
    Debug Version:     175.5K Code, 74.5K Data, 250.0K Total
  Current Release:
    Non-Debug Version:  94.3K Code, 25.3K Data, 119.6K Total
    Debug Version:     175.5K Code, 74.5K Data, 250.0K Total
```

2) iASL Compiler/Disassembler and Tools:

Disassembler: Added the new ACPI 5.0 interrupt sharing flags. This change adds the ShareAndWake and ExclusiveAndWake flags which were added to the Irq, Interrupt, and Gpio resource descriptors in ACPI 5.0. ACPICA BZ 986.

Disassembler: Fixed a problem with external declaration generation. Fixes a problem where an incorrect pathname could be generated for an external declaration if the original reference to the object includes leading carats (^). ACPICA BZ 984.

Debugger: Completed a major update for the Disassemble<method> command. This command was out-of-date and did not properly disassemble control methods that had any reasonable complexity. This fix brings the command up to the same level as the rest of the disassembler. Adds one new file, dmdeferred.c, which is existing code that is now common with the main disassembler and the debugger disassemble command. ACPICA MZ 978.

iASL: Moved the parser entry prototype to avoid a duplicate declaration. Newer versions of Bison emit this prototype, so moved the prototype out of the iASL header to where it is actually used in order to avoid a duplicate declaration.

iASL/Tools: Standardized use of the stream I/O functions:
  1) Ensure check for I/O error after every fopen/fread/fwrite
  2) Ensure proper order of size/count arguments for fread/fwrite
  3) Use test of (Actual != Requested) after all fwrite, and most fread
  4) Standardize I/O error messages
Improves reliability and maintainability of the code. Bob Moore, Lv Zheng.
ACPICA BZ 981.

Disassembler: Prevent duplicate External() statements. During generation of external statements, detect similar pathnames that are actually duplicates such as these:
  External (\ABCD)
  External (ABCD)
Remove all leading '\' characters from pathnames during the external statement generation so that duplicates will be detected and tossed.
ACPICA BZ 985.

Tools: Replace low-level I/O with stream I/O functions. Replace open/read/write/close with the stream I/O equivalents fopen/fread/fwrite/fclose for portability and performance. Lv Zheng, Bob Moore.

AcpiBin: Fix for the dump-to-hex function. Now correctly output the table name header so that AcpiXtract recognizes the output file/table.

iASL: Remove obsolete -2 option flag. Originally intended to force the compiler/disassembler into an ACPI 2.0 mode, this was never implemented and the entire concept is now obsolete.

---

18 October 2012. Summary of changes for version 20121018:

1) ACPICA Kernel-resident Subsystem:

Updated support for the ACPI 5.0 MPST table. Fixes some problems introduced by late changes to the table as it was added to the ACPI 5.0 specification. Includes header, disassembler, and data table compiler support as well as a new version of the MPST template.

AcpiGetObjectInfo: Enhanced the device object support to include the ACPI 5.0 _SUB method. Now calls _SUB in addition to the other PNP-related ID methods: _HID, _CID, and _UID.

Changed ACPI_DEVICE_ID to ACPI_PNP_DEVICE_ID. Also changed ACPI_DEVICE_ID_LIST to ACPI_PNP_DEVICE_ID_LIST. These changes prevent name collisions on hosts that reserve the *_DEVICE_ID (or *DeviceId) names for their various drivers. Affects the AcpiGetObjectInfo external interface, and other internal interfaces as well.

Added and deployed a new macro for ACPI_NAME management: ACPI_MOVE_NAME. This macro resolves to a simple 32-bit move of the 4-character ACPI_NAME on machines that support non-aligned transfers. Optimizes for this case rather than using a strncpy. With assistance from Zheng Lv.

Resource Manager: Small fix for buffer size calculation. Fixed a one byte error in the output buffer calculation. Feng Tang. ACPICA BZ 849.

Added a new debug print message for AML mutex objects that are force-released. At control method termination, any currently acquired mutex objects are force-released. Adds a new debug-only message for each one that is released.

Audited/updated all ACPICA return macros and the function debug depth counter: 1) Ensure that all functions that use the various TRACE macros also use the appropriate ACPICA return macros. 2) Ensure that all normal return statements surround the return expression (value) with parens to ensure consistency across the ACPICA code base. Guan Chao, Tang Feng, Zheng Lv, Bob Moore. ACPICA Bugzilla 972.

Global source code changes/maintenance: All extra lines at the start and end of each source file have been removed for consistency. Also, within comments, all new sentences start with a single space instead of a double space, again for consistency across the code base.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  93.7K Code, 25.3K Data, 119.0K Total
```

```
    Debug Version:     175.0K Code, 74.4K Data, 249.4K Total
  Current Release:
    Non-Debug Version:  93.9K Code, 25.2K Data, 119.1K Total
    Debug Version:     175.5K Code, 74.5K Data, 250.0K Total

2) iASL Compiler/Disassembler and Tools:

AcpiExec: Improved the algorithm used for memory leak/corruption
detection. Added some intelligence to the code that maintains the global
list of allocated memory. The list is now ordered by allocated memory
address, significantly improving performance. When running AcpiExec on
the ASLTS test suite, speed improvements of 3X to 5X are seen, depending
on the platform and/or the environment. Note, this performance
enhancement affects the AcpiExec utility only, not the kernel-resident
ACPICA code.

Enhanced error reporting for invalid AML opcodes and bad ACPI_NAMEs. For
the disassembler, dump the 48 bytes surrounding the invalid opcode. Fix
incorrect table offset reported for invalid opcodes. Report the original
32-bit value for bad ACPI_NAMEs (as well as the repaired name.)

Disassembler: Enhanced the -vt option to emit the binary table data in
hex format to assist with debugging.

Fixed a potential filename buffer overflow in osunixdir.c. Increased the
size of file structure. Colin Ian King.

----------------------------------------
13 September 2012. Summary of changes for version 20120913:

1) ACPICA Kernel-resident Subsystem:

ACPI 5.0: Added two new notify types for the Hardware Error Notification
Structure within the Hardware Error Source Table (HEST) table -- CMCI(5)
and
MCE(6).

Table Manager: Merged/removed duplicate code in the root table resize
functions. One function is external, the other is internal. Lv Zheng,
ACPICA
BZ 846.

Makefiles: Completely removed the obsolete "Linux" makefiles under
acpica/generate/linux. These makefiles are obsolete and have been
replaced
by
the generic unix makefiles under acpica/generate/unix.

Makefiles: Ensure that binary files always copied properly. Minor rule
change
to ensure that the final binary output files are always copied up to the
appropriate binary directory (bin32 or bin64.)

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug
version of the code includes the debug output trace mechanism and has a
much
larger code and data size.

  Previous Release:
    Non-Debug Version:  93.8K Code, 25.3K Data, 119.1K Total
    Debug Version:     175.7K Code, 74.8K Data, 250.5K Total
  Current Release:
```

```
    Non-Debug Version:  93.7K Code, 25.3K Data, 119.0K Total
    Debug Version:     175.0K Code, 74.4K Data, 249.4K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: Fixed a possible fault during the disassembly of resource
descriptors when a second parse is required because of the invocation of
external control methods within the table. With assistance from
adq@lidskialf.net. ACPICA BZ 976.

iASL: Fixed a namepath optimization problem. An error can occur if the
parse
node that contains the namepath to be optimized does not have a parent
node
that is a named object. This change fixes the problem.

iASL: Fixed a regression where the AML file is not deleted on errors. The
AML
output file should be deleted if there are any errors during the
compiler.
The
only exception is if the -f (force output) option is used. ACPICA BZ 974.

iASL: Added a feature to automatically increase internal line buffer
sizes.
Via realloc(), automatically increase the internal line buffer sizes as
necessary to support very long source code lines. The current version of
the
preprocessor requires a buffer long enough to contain full source code
lines.
This change increases the line buffer(s) if the input lines go beyond the
current buffer size. This eliminates errors that occurred when a source
code
line was longer than the buffer.

iASL: Fixed a problem with constant folding in method declarations. The
SyncLevel term is a ByteConstExpr, and incorrect code would be generated
if a
Type3 opcode was used.

Debugger: Improved command help support. For incorrect argument count,
display
full help for the command. For help command itself, allow an argument to
specify a command.

Test Suites: Several bug fixes for the ASLTS suite reduces the number of
errors during execution of the suite. Guan Chao.

----------------------------------------
16 August 2012. Summary of changes for version 20120816:

1) ACPICA Kernel-resident Subsystem:

Removed all use of the deprecated _GTS and _BFS predefined methods. The
_GTS
(Going To Sleep) and _BFS (Back From Sleep) methods are essentially
deprecated and will probably be removed from the ACPI specification.
Windows
does not invoke them, and reportedly never will. The final nail in the
coffin
is that the ACPI specification states that these methods must be run with
interrupts off, which is not going to happen in a kernel interpreter.
Note:
Linux has removed all use of the methods also. It was discovered that
```

invoking these functions caused failures on some machines, probably because
they were never tested since Windows does not call them. Affects two external
interfaces, AcpiEnterSleepState and AcpiLeaveSleepStatePrep. Tang Feng.
ACPICA BZ 969.

Implemented support for complex bit-packed buffers returned from the _PLD
(Physical Location of Device) predefined method. Adds a new external
interface, AcpiDecodePldBuffer that parses the buffer into a more usable C
structure. Note: C Bitfields cannot be used for this type of predefined
structure since the memory layout of individual bitfields is not defined by
the C language. In addition, there are endian concerns where a compiler will
change the bitfield ordering based on the machine type. The new ACPICA
interface eliminates these issues, and should be called after _PLD is
executed. ACPICA BZ 954.

Implemented a change to allow a scope change to root (via "Scope (\)") during
execution of module-level ASL code (code that is executed at table load
time.) Lin Ming.

Added the Windows8/Server2012 string for the _OSI method. This change adds a
new _OSI string, "Windows 2012" for both Windows 8 and Windows Server 2012.

Added header support for the new ACPI tables DBG2 (Debug Port Table Type 2)
and CSRT (Core System Resource Table).

Added struct header support for the _FDE, _GRT, _GTM, and _SRT predefined
names. This simplifies access to the buffers returned by these predefined
names. Adds a new file, include/acbuffer.h. ACPICA BZ 956.

GPE support: Removed an extraneous parameter from the various low-level
internal GPE functions. Tang Feng.

Removed the linux makefiles from the unix packages. The generate/linux
makefiles are obsolete and have been removed from the unix tarball release
packages. The replacement makefiles are under generate/unix, and there is a
top-level makefile under the main acpica directory. ACPICA BZ 967, 912.

Updates for Unix makefiles:
1) Add -D_FORTIFY_SOURCE=2 for gcc generation. Arjan van de Ven.
2) Update linker flags (move to end of command line) for AcpiExec utility.
Guan Chao.

Split ACPICA initialization functions to new file, utxfinit.c. Split from
utxface.c to improve modularity and reduce file size.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

  Previous Release:
    Non-Debug Version: 93.5K Code, 25.3K Data, 118.8K Total

    Debug Version: 173.7K Code, 74.0K Data, 247.7K Total
  Current Release:
    Non-Debug Version: 93.8K Code, 25.3K Data, 119.1K Total
    Debug Version: 175.7K Code, 74.8K Data, 250.5K Total

2) iASL Compiler/Disassembler and Tools:

iASL: Fixed a problem with constant folding for fixed-length constant
expressions. The constant-folding code was not being invoked for constant
expressions that allow the use of type 3/4/5 opcodes to generate constants
for expressions such as ByteConstExpr, WordConstExpr, etc. This could result
in the generation of invalid AML bytecode. ACPICA BZ 970.

iASL: Fixed a generation issue on newer versions of Bison. Newer versions
apparently automatically emit some of the necessary externals. This change
handles these versions in order to eliminate generation warnings.

Disassembler: Added support to decode the DBG2 and CSRT ACPI tables.

Disassembler: Add support to decode _PLD buffers. The decoded buffer appears
within comments in the output file.

Debugger: Fixed a regression with the "Threads" command where
AE_BAD_PARAMETER was always returned.

----
11 July 2012. Summary of changes for version 20120711:

1) ACPICA Kernel-resident Subsystem:

Fixed a possible fault in the return package object repair code. Fixes a
problem that can occur when a lone package object is wrapped with an outer
package object in order to force conformance to the ACPI specification. Can
affect these predefined names: _ALR, _MLS, _PSS, _TRT, _TSS, _PRT, _HPX,
_DLM,
_CSD, _PSD, _TSD.

Removed code to disable/enable bus master arbitration (ARB_DIS bit in the
PM2_CNT register) in the ACPICA sleep/wake interfaces. Management of the
ARB_DIS bit must be implemented in the host-dependent C3 processor power
state
support. Note, ARB_DIS is obsolete and only applies to older chipsets, both
Intel and other vendors. (for Intel: ICH4-M and earlier)

This change removes the code to disable/enable bus master arbitration during
suspend/resume. Use of the ARB_DIS bit in the optional PM2_CNT register
causes
resume problems on some machines. The change has been in use for over seven
years within Linux.

Implemented two new external interfaces to support host-directed dynamic
ACPI
table load and unload. They are intended to simplify the host
implementation
of hot-plug support:
  AcpiLoadTable: Load an SSDT from a buffer into the namespace.

```
  AcpiUnloadParentTable: Unload an SSDT via a named object owned by the
table.
See the ACPICA reference for additional details. Adds one new file,
components/tables/tbxfload.c

Implemented and deployed two new interfaces for errors and warnings that
are
known to be caused by BIOS/firmware issues:
  AcpiBiosError: Prints "ACPI Firmware Error" message.
  AcpiBiosWarning: Prints "ACPI Firmware Warning" message.
Deployed these new interfaces in the ACPICA Table Manager code for ACPI
table
and FADT errors. Additional deployment to be completed as appropriate in
the
future. The associated conditional macros are ACPI_BIOS_ERROR and
ACPI_BIOS_WARNING. See the ACPICA reference for additional details.
ACPICA
BZ
843.

Implicit notify support: ensure that no memory allocation occurs within a
critical region. This fix moves a memory allocation outside of the time
that a
spinlock is held. Fixes issues on systems that do not allow this
behavior.
Jung-uk Kim.

Split exception code utilities and tables into a new file,
utilities/utexcep.c

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug
version of the code includes the debug output trace mechanism and has a
much
larger code and data size.

  Previous Release:
    Non-Debug Version:  93.1K Code, 25.1K Data, 118.2K Total
    Debug Version:     172.9K Code, 73.6K Data, 246.5K Total
  Current Release:
    Non-Debug Version:  93.5K Code, 25.3K Data, 118.8K Total
    Debug Version:     173.7K Code, 74.0K Data, 247.7K Total

2) iASL Compiler/Disassembler and Tools:

iASL: Fixed a parser problem for hosts where EOF is defined as -1 instead
of
0. Jung-uk Kim.

Debugger: Enhanced the "tables" command to emit additional information
about
the current set of ACPI tables, including the owner ID and flags decode.

Debugger: Reimplemented the "unload" command to use the new
AcpiUnloadParentTable external interface. This command was disable
previously
due to need for an unload interface.

AcpiHelp: Added a new option to decode ACPICA exception codes. The -e
option
will decode 16-bit hex status codes (ACPI_STATUS) to name strings.

----------------------------------------
20 June 2012. Summary of changes for version 20120620:
```

```

1) ACPICA Kernel-resident Subsystem:

Implemented support to expand the "implicit notify" feature to allow
multiple
devices to be notified by a single GPE. This feature automatically
generates a
runtime device notification in the absence of a BIOS-provided GPE control
method (_Lxx/_Exx) or a host-installed handler for the GPE. Implicit
notify is
provided by ACPICA for Windows compatibility, and is a workaround for
BIOS
AML
code errors. See the description of the AcpiSetupGpeForWake interface in
the
APCICA reference. Bob Moore, Rafael Wysocki. ACPICA BZ 918.

Changed some comments and internal function names to simplify and ensure
correctness of the Linux code translation. No functional changes.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug
version of the code includes the debug output trace mechanism and has a
much
larger code and data size.

  Previous Release:
    Non-Debug Version:  93.0K Code, 25.1K Data, 118.1K Total
    Debug Version:     172.7K Code, 73.6K Data, 246.3K Total
  Current Release:
    Non-Debug Version:  93.1K Code, 25.1K Data, 118.2K Total
    Debug Version:     172.9K Code, 73.6K Data, 246.5K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: Added support to emit short, commented descriptions for the
ACPI
predefined names in order to improve the readability of the disassembled
output. ACPICA BZ 959. Changes include:
  1) Emit descriptions for all standard predefined names (_INI, _STA,
_PRW,
etc.)
  2) Emit generic descriptions for the special names (_Exx, _Qxx, etc.)
  3) Emit descriptions for the resource descriptor names (_MIN, _LEN,
etc.)

AcpiSrc: Fixed several long-standing Linux code translation issues.
Argument
descriptions in function headers are now translated properly to lower
case
and
underscores. ACPICA BZ 961. Also fixes translation problems such as
these:
(old -> new)
  i_aSL -> iASL
  00-7_f -> 00-7F
  16_k -> 16K
  local_fADT -> local_FADT
  execute_oSI -> execute_OSI

iASL: Fixed a problem where null bytes were inadvertently emitted into
some
listing files.
```

iASL: Added the existing debug options to the standard help screen. There are
no longer two different help screens. ACPICA BZ 957.

AcpiHelp: Fixed some typos in the various predefined name descriptions. Also
expand some of the descriptions where appropriate.

iASL: Fixed the -ot option (display compile times/statistics). Was not working
properly for standard output; only worked for the debug file case.

---
18 May 2012. Summary of changes for version 20120518:

1) ACPICA Core Subsystem:

Added a new OSL interface, AcpiOsWaitEventsComplete. This interface is defined
to block until asynchronous events such as notifies and GPEs have completed.
Within ACPICA, it is only called before a notify or GPE handler is
removed/uninstalled. It also may be useful for the host OS within related
drivers such as the Embedded Controller driver. See the ACPICA reference for
additional information. ACPICA BZ 868.

ACPI Tables: Added a new error message for a possible overflow failure during
the conversion of FADT 32-bit legacy register addresses to internal common
64-
bit GAS structure representation. The GAS has a one-byte "bit length" field,
thus limiting the register length to 255 bits. ACPICA BZ 953.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug
version of the code includes the debug output trace mechanism and has a much
larger code and data size.

```
  Previous Release:
    Non-Debug Version:  92.9K Code, 25.0K Data, 117.9K Total
    Debug Version:     172.6K Code, 73.4K Data, 246.0K Total
  Current Release:
    Non-Debug Version:  93.0K Code, 25.1K Data, 118.1K Total
    Debug Version:     172.7K Code, 73.6K Data, 246.3K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Added the ACPI 5.0 "PCC" keyword for use in the Register() ASL macro.
This keyword was added late in the ACPI 5.0 release cycle and was not
implemented until now.

Disassembler: Added support for Operation Region externals. Adds missing
support for operation regions that are defined in another table, and
referenced locally via a Field or BankField ASL operator. Now generates the
correct External statement.

Disassembler: Several additional fixes for the External() statement generation
related to some ASL operators. Also, order the External() statements
alphabetically in the disassembler output. Fixes the External() generation for
the Create* field, Alias, and Scope operators:
 1) Create* buffer field operators - fix type mismatch warning on disassembly
 2) Alias - implement missing External support
 3) Scope - fix to make sure all necessary externals are emitted.

iASL: Improved pathname support. For include files, merge the prefix pathname
with the file pathname and eliminate unnecessary components. Convert
backslashes in all pathnames to forward slashes, for readability. Include file
pathname changes affect both #include and Include() type operators.

iASL/DTC/Preprocessor: Gracefully handle early EOF. Handle an EOF at the end
of a valid line by inserting a newline and then returning the EOF during the
next call to GetNextLine. Prevents the line from being ignored due to EOF
condition.

iASL: Implemented some changes to enhance the IDE support (-vi option.) Error
and Warning messages are now correctly recognized for both the source code
browser and the global error and warning counts.

---
20 April 2012. Summary of changes for version 20120420:

1) ACPICA Core Subsystem:

Implemented support for multiple notify handlers. This change adds support to
allow multiple system and device notify handlers on Device, Thermal Zone, and
Processor objects. This can simplify the host OS notification implementation.
Also re-worked and restructured the entire notify support code to simplify
handler installation, handler removal, notify event queuing, and notify
dispatch to handler(s). Note: there can still only be two global notify
handlers - one for system notifies and one for device notifies. There are no
changes to the existing handler install/remove interfaces. Lin Ming, Bob
Moore, Rafael Wysocki.

Fixed a regression in the package repair code where the object reference
count was calculated incorrectly. Regression was introduced in the commit
"Support to add Package wrappers".

Fixed a couple possible memory leaks in the AML parser, in the error recovery
path. Jesper Juhl, Lin Ming.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a

much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  92.9K Code, 25.0K Data, 117.9K Total
    Debug Version:     172.5K Code, 73.2K Data, 245.7K Total
  Current Release:
    Non-Debug Version:  92.9K Code, 25.0K Data, 117.9K Total
    Debug Version:     172.6K Code, 73.4K Data, 246.0K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Fixed a problem with the resource descriptor support where the length
of the StartDependentFn and StartDependentFnNoPrio descriptors were not
included in cumulative descriptor offset, resulting in incorrect values for
resource tags within resource descriptors appearing after a StartDependent*
descriptor. Reported by Petr Vandrovec. ACPICA BZ 949.

iASL and Preprocessor: Implemented full support for the #line directive to
correctly track original source file line numbers through the .i preprocessor
output file - for error and warning messages.

iASL: Expand the allowable byte constants for address space IDs. Previously,
the allowable range was 0x80-0xFF (user-defined spaces), now the range is
0x0A-0xFF to allow for custom and new IDs without changing the compiler.

iASL: Add option to treat all warnings as errors (-we). ACPICA BZ 948.

iASL: Add option to completely disable the preprocessor (-Pn).

iASL: Now emit all error/warning messages to standard error (stderr) by
default (instead of the previous stdout).

ASL Test Suite (ASLTS): Reduce iASL warnings due to use of Switch(). Update
for resource descriptor offset fix above. Update/cleanup error output
routines. Enable and send iASL errors/warnings to an error logfile
(error.txt). Send all other iASL output to a logfile (compiler.txt). Fixed
several extraneous "unrecognized operator" messages.

---

20 March 2012. Summary of changes for version 20120320:

1) ACPICA Core Subsystem:

Enhanced the sleep/wake interfaces to optionally execute the _GTS method
(Going To Sleep) and the _BFS method (Back From Sleep). Windows apparently
does not execute these methods, and therefore these methods are often
untested. It has been seen on some systems where the execution of these
methods causes errors and also prevents the machine from entering S5. It is
therefore suggested that host operating systems do not execute these methods
by default. In the future, perhaps these methods can be optionally executed
based on the age of the system and/or what is the newest version of Windows

that the BIOS asks for via _OSI. Changed interfaces: AcpiEnterSleepState and
AcpileaveSleepStatePrep. See the ACPICA reference and Linux BZ 13041. Lin
Ming.

Fixed a problem where the length of the local/common FADT was set too early.
The local FADT table length cannot be set to the common length until the
original length has been examined. There is code that checks the table length
and sets various fields appropriately. This can affect older machines with
early FADT versions. For example, this can cause inadvertent writes to the
CST_CNT register. Julian Anastasov.

Fixed a mapping issue related to a physical table override. Use the deferred
mapping mechanism for tables loaded via the physical override OSL interface.
This allows for early mapping before the virtual memory manager is available.
Thomas Renninger, Bob Moore.

Enhanced the automatic return-object repair code: Repair a common problem with
predefined methods that are defined to return a variable-length Package of
sub-objects. If there is only one sub-object, some BIOS ASL code mistakenly
simply returns the single object instead of a Package with one sub-object.
This new support will repair this error by wrapping a Package object around
the original object, creating the correct and expected Package with one sub-
object. Names that can be repaired in this manner include: _ALR, _CSD, _HPX,
_MLS, _PLD, _PRT, _PSS, _TRT, _TSS, _BCL, _DOD, _FIX, and _Sx. ACPICA BZ 939.

Changed the exception code returned for invalid ACPI paths passed as
parameters to external interfaces such as AcpiEvaluateObject. Was
AE_BAD_PARAMETER, now is the more sensible AE_BAD_PATHNAME.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug
version of the code includes the debug output trace mechanism and has a much
larger code and data size.

```
  Previous Release:
    Non-Debug Version:  93.0K Code, 25.0K Data, 118.0K Total
    Debug Version:     172.5K Code, 73.2K Data, 245.7K Total
  Current Release:
    Non-Debug Version:  92.9K Code, 25.0K Data, 117.9K Total
    Debug Version:     172.5K Code, 73.2K Data, 245.7K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Added the infrastructure and initial implementation of a integrated C-
like preprocessor. This will simplify BIOS development process by eliminating

the need for a separate preprocessing step during builds. On Windows, it also
eliminates the need to install a separate C compiler. ACPICA BZ 761. Some
features including full #define() macro support are still under development.
These preprocessor directives are supported:
    #define
    #elif
    #else
    #endif
    #error
    #if
    #ifdef
    #ifndef
    #include
    #pragma message
    #undef
    #warning
In addition, these new command line options are supported:
    -D <symbol> Define symbol for preprocessor use
    -li   Create preprocessed output file (*.i)
    -P   Preprocess only and create preprocessor output file (*.i)

Table Compiler: Fixed a problem where the equals operator within an expression
did not work properly.

Updated iASL to use the current versions of Bison/Flex. Updated the Windows
project file to invoke these tools from the standard location. ACPICA BZ 904.
Versions supported:
    Flex for Windows: V2.5.4
    Bison for Windows: V2.4.1

----
15 February 2012. Summary of changes for version 20120215:

1) ACPICA Core Subsystem:

There have been some major changes to the sleep/wake support code, as
described below (a - e).

a) The AcpiLeaveSleepState has been split into two interfaces, similar to
AcpiEnterSleepStatePrep and AcpiEnterSleepState. The new interface is
AcpiLeaveSleepStatePrep. This allows the host to perform actions between the
time the _BFS method is called and the _WAK method is called. NOTE: all hosts
must update their wake/resume code or else sleep/wake will not work properly.
Rafael Wysocki.

b) In AcpiLeaveSleepState, now enable all runtime GPEs before calling the _WAK
method. Some machines require that the GPEs are enabled before the _WAK method
is executed. Thomas Renninger.

c) In AcpiLeaveSleepState, now always clear the WAK_STS (wake status) bit.
Some BIOS code assumes that WAK_STS will be cleared on resume and use it to
determine whether the system is rebooting or resuming. Matthew Garrett.

d) Move the invocations of _GTS (Going To Sleep) and _BFS (Back From Sleep) to
match the ACPI specification requirement. Rafael Wysocki.

e) Implemented full support for the ACPI 5.0 SleepStatus and SleepControl
registers within the V5 FADT. This support adds two new files:
hardware/hwesleep.c implements the support for the new registers. Moved all
sleep/wake external interfaces to hardware/hwxfsleep.c.

Added a new OSL interface for ACPI table overrides,
AcpiOsPhysicalTableOverride. This interface allows the host to override a
table via a physical address, instead of the logical address required by
AcpiOsTableOverride. This simplifies the host implementation. Initial
implementation by Thomas Renninger. The ACPICA implementation creates a single
shared function for table overrides that attempts both a logical and a
physical override.

Expanded the OSL memory read/write interfaces to 64-bit data
(AcpiOsReadMemory, AcpiOsWriteMemory.) This enables full 64-bit memory
transfer support for GAS register structures passed to AcpiRead and
AcpiWrite.

Implemented the ACPI_REDUCED_HARDWARE option to allow the creation of a custom
build of ACPICA that supports only the ACPI 5.0 reduced hardware (SoC) model.
See the ACPICA reference for details. ACPICA BZ 942. This option removes about
10% of the code and 5% of the static data, and the following hardware ACPI
features become unavailable:
    PM Event and Control registers
    SCI interrupt (and handler)
    Fixed Events
    General Purpose Events (GPEs)
    Global Lock
    ACPI PM timer
    FACS table (Waking vectors and Global Lock)

Updated the unix tarball directory structure to match the ACPICA git source
tree. This ensures that the generic unix makefiles work properly (in
generate/unix). Also updated the Linux makefiles to match. ACPICA BZ 867.

Updated the return value of the _REV predefined method to integer value 5 to
reflect ACPI 5.0 support.

Moved the external ACPI PM timer interface prototypes to the public acpixf.h
file where they belong.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug
version of the code includes the debug output trace mechanism and has a much
larger code and data size.

  Previous Release:
    Non-Debug Version: 92.8K Code, 24.9K Data, 117.7K Total
    Debug Version: 171.7K Code, 72.9K Data, 244.5K Total

```
  Current Release:
    Non-Debug Version:  93.0K Code, 25.0K Data, 118.0K Total
    Debug Version:     172.5K Code, 73.2K Data, 245.7K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: Fixed a problem with the new ACPI 5.0 serial resource
descriptors (I2C, SPI, UART) where the resource produce/consumer bit was
incorrectly displayed.

AcpiHelp: Add display of ACPI/PNP device IDs that are defined in the ACPI
specification.

----------------------------------------
11 January 2012. Summary of changes for version 20120111:

1) ACPICA Core Subsystem:

Implemented a new mechanism to allow host device drivers to check for
address
range conflicts with ACPI Operation Regions. Both SystemMemory and
SystemIO
address spaces are supported. A new external interface,
AcpiCheckAddressRange,
allows drivers to check an address range against the ACPI namespace. See
the
ACPICA reference for additional details. Adds one new file,
utilities/utaddress.c. Lin Ming, Bob Moore.

Fixed several issues with the ACPI 5.0 FADT support: Add the sleep
Control
and
Status registers, update the ACPI 5.0 flags, and update internal data
structures to handle an FADT larger than 256 bytes. The size of the ACPI
5.0
FADT is 268 bytes.

Updated all ACPICA copyrights and signons to 2012. Added the 2012
copyright to
all module headers and signons, including the standard Linux header. This
affects virtually every file in the ACPICA core subsystem, iASL compiler,
and
all ACPICA utilities.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug
version of the code includes the debug output trace mechanism and has a
much
larger code and data size.

  Previous Release:
    Non-Debug Version:  92.3K Code, 24.9K Data, 117.2K Total
    Debug Version:     170.8K Code, 72.6K Data, 243.4K Total
  Current Release:
    Non-Debug Version:  92.8K Code, 24.9K Data, 117.7K Total
    Debug Version:     171.7K Code, 72.9K Data, 244.5K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: fixed a problem with the automatic resource tag generation
support. Fixes a problem where the resource tags are inadvertently not
constructed if the table being disassembled contains external references
```

```
to
control methods. Moved the actual construction of the tags to after the
final
namespace is constructed (after 2nd parse is invoked due to external
control
method references.) ACPICA BZ 941.

Table Compiler: Make all "generic" operators caseless. These are the
operators
like UINT8, String, etc. Making these caseless improves ease-of-use.
ACPICA BZ
934.

----------------------------------------
23 November 2011. Summary of changes for version 20111123:

0) ACPI 5.0 Support:

This release contains full support for the ACPI 5.0 specification, as
summarized below.

Reduced Hardware Support:
-------------------------

This support allows for ACPI systems without the usual ACPI hardware.
This
support is enabled by a flag in the revision 5 FADT. If it is set, ACPICA
will
not attempt to initialize or use any of the usual ACPI hardware. Note,
when
this flag is set, all of the following ACPI hardware is assumed to be not
present and is not initialized or accessed:

    General Purpose Events (GPEs)
    Fixed Events (PM1a/PM1b and PM Control)
    Power Management Timer and Console Buttons (power/sleep)
    Real-time Clock Alarm
    Global Lock
    System Control Interrupt (SCI)
    The FACS is assumed to be non-existent

ACPI Tables:
------------

All new tables and updates to existing tables are fully supported in the
ACPICA headers (for use by device drivers), the disassembler, and the
iASL
Data Table Compiler. ACPI 5.0 defines these new tables:

    BGRT        /* Boot Graphics Resource Table */
    DRTM        /* Dynamic Root of Trust for Measurement table */
    FPDT        /* Firmware Performance Data Table */
    GTDT        /* Generic Timer Description Table */
    MPST        /* Memory Power State Table */
    PCCT        /* Platform Communications Channel Table */
    PMTT        /* Platform Memory Topology Table */
    RASF        /* RAS Feature table */

Operation Regions/SpaceIDs:
---------------------------

All new operation regions are fully supported by the iASL compiler, the
disassembler, and the ACPICA runtime code (for dispatch to region
handlers.)
The new operation region Space IDs are:
```

```
    GeneralPurposeIo
    GenericSerialBus

Resource Descriptors:
---------------------

All new ASL resource descriptors are fully supported by the iASL
compiler,
the
ASL/AML disassembler, and the ACPICA runtime Resource Manager code
(including
all new predefined resource tags). New descriptors are:

    FixedDma
    GpioIo
    GpioInt
    I2cSerialBus
    SpiSerialBus
    UartSerialBus

ASL/AML Operators, New and Modified:
------------------------------------

One new operator is added, the Connection operator, which is used to
associate
a GeneralPurposeIo or GenericSerialBus resource descriptor with
individual
field objects within an operation region. Several new protocols are
associated
with the AccessAs operator. All are fully supported by the iASL compiler,
disassembler, and runtime ACPICA AML interpreter:

    Connection                      // Declare Field Connection
attributes
    AccessAs: AttribBytes (n)           // Read/Write N-Bytes Protocol
    AccessAs: AttribRawBytes (n)        // Raw Read/Write N-Bytes
Protocol
    AccessAs: AttribRawProcessBytes (n) // Raw Process Call Protocol
    RawDataBuffer                       // Data type for Vendor Data
fields

Predefined ASL/AML Objects:
---------------------------

All new predefined objects/control-methods are supported by the iASL
compiler
and the ACPICA runtime validation/repair (arguments and return values.)
New
predefined names include the following:

Standard Predefined Names (Objects or Control Methods):
    _AEI, _CLS, _CPC, _CWS, _DEP,
    _DLM, _EVT, _GCP, _CRT, _GWS,
    _HRV, _PRE, _PSE, _SRT, _SUB.

Resource Tags (Names used to access individual fields within resource
descriptors):
    _DBT, _DPL, _DRS, _END, _FLC,
    _IOR, _LIN, _MOD, _PAR, _PHA,
    _PIN, _PPI, _POL, _RXL, _SLV,
    _SPE, _STB, _TXL, _VEN.

ACPICA External Interfaces:
---------------------------

Several new interfaces have been defined for use by ACPI-related device
```

```
drivers and other host OS services:

AcpiAcquireMutex and AcpiReleaseMutex: These interfaces allow the host OS
to
acquire and release AML mutexes that are defined in the DSDT/SSDT tables
provided by the BIOS. They are intended to be used in conjunction with
the
ACPI 5.0 _DLM (Device Lock Method) in order to provide transaction-level
mutual exclusion with the AML code/interpreter.

AcpiGetEventResources: Returns the (formatted) resource descriptors as
defined
by the ACPI 5.0 _AEI object (ACPI Event Information).  This object
provides
resource descriptors associated with hardware-reduced platform events,
similar
to the AcpiGetCurrentResources interface.

Operation Region Handlers: For General Purpose IO and Generic Serial Bus
operation regions, information about the Connection() object and any
optional
length information is passed to the region handler within the Context
parameter.

AcpiBufferToResource: This interface converts a raw AML buffer containing
a
resource template or resource descriptor to the ACPI_RESOURCE internal
format
suitable for use by device drivers. Can be used by an operation region
handler
to convert the Connection() buffer object into a ACPI_RESOURCE.

Miscellaneous/Tools/TestSuites:
-------------------------------

Support for extended _HID names (Four alpha characters instead of three).
Support for ACPI 5.0 features in the AcpiExec and AcpiHelp utilities.
Support for ACPI 5.0 features in the ASLTS test suite.
Fully updated documentation (ACPICA and iASL reference documents.)

ACPI Table Definition Language:
-------------------------------

Support for this language was implemented and released as a subsystem of
the
iASL compiler in 2010. (See the iASL compiler User Guide.)

Non-ACPI 5.0 changes for this release:
--------------------------------------

1) ACPICA Core Subsystem:

Fix a problem with operation region declarations where a failure can
occur
if
the region name and an argument that evaluates to an object (such as the
region address) are in different namespace scopes. Lin Ming, ACPICA BZ
937.

Do not abort an ACPI table load if an invalid space ID is found within.
This
will be caught later if the offending method is executed. ACPICA BZ 925.

Fixed an issue with the FFixedHW space ID where the ID was not always
recognized properly (Both ACPICA and iASL). ACPICA BZ 926.
```

Fixed a problem with the 32-bit generation of the unix-specific OSL
(osunixxf.c). Lin Ming, ACPICA BZ 936.

Several changes made to enable generation with the GCC 4.6 compiler.
ACPICA BZ
935.

New error messages: Unsupported I/O requests (not 8/16/32 bit), and
Index/Bank
field registers out-of-range.

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented the __PATH__ operator, which returns the full pathname
of
the current source file.

AcpiHelp: Automatically display expanded keyword information for all ASL
operators.

Debugger: Add "Template" command to disassemble/dump resource template
buffers.

Added a new master script to generate and execute the ASLTS test suite.
Automatically handles 32- and 64-bit generation. See tests/aslts.sh

iASL: Fix problem with listing generation during processing of the
Switch()
operator where AML listing was disabled until the entire Switch block was
completed.

iASL: Improve support for semicolon statement terminators. Fix "invalid
character" message for some cases when the semicolon is used. Semicolons
are
now allowed after every <Term> grammar element. ACPICA BZ 927.

iASL: Fixed some possible aliasing warnings during generation. ACPICA BZ
923.

Disassembler: Fix problem with disassembly of the DataTableRegion
operator
where an inadvertent "Unhandled deferred opcode" message could be
generated.

3) Example Code and Data Size

These are the sizes for the OS-independent acpica.lib produced by the
Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code
includes the debug output trace mechanism and has a much larger code and
data
size.

```
  Previous Release:
    Non-Debug Version:  90.2K Code, 23.9K Data, 114.1K Total
    Debug Version:     165.6K Code, 68.4K Data, 234.0K Total
  Current Release:
    Non-Debug Version:  92.3K Code, 24.9K Data, 117.2K Total
    Debug Version:     170.8K Code, 72.6K Data, 243.4K Total
```

---

22 September 2011. Summary of changes for version 20110922:

0) ACPI 5.0 News:

Support for ACPI 5.0 in ACPICA has been underway for several months and

will
be released at the same time that ACPI 5.0 is officially released.

The ACPI 5.0 specification is on track for release in the next few
months.

1) ACPICA Core Subsystem:

Fixed a problem where the maximum sleep time for the Sleep() operator was
intended to be limited to two seconds, but was inadvertently limited to
20
seconds instead.

Linux and Unix makefiles: Added header file dependencies to ensure
correct
generation of ACPICA core code and utilities. Also simplified the
makefiles
considerably through the use of the vpath variable to specify search
paths.
ACPICA BZ 924.

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented support to check the access length for all fields
created to
access named Resource Descriptor fields. For example, if a resource field
is
defined to be two bits, a warning is issued if a CreateXxxxField() is
used
with an incorrect bit length. This is implemented for all current
resource
descriptor names. ACPICA BZ 930.

Disassembler: Fixed a byte ordering problem with the output of 24-bit and
56-
bit integers.

iASL: Fixed a couple of issues associated with variable-length package
objects. 1) properly handle constants like One, Ones, Zero -- do not make
a
VAR_PACKAGE when these are used as a package length. 2) Allow the
VAR_PACKAGE
opcode (in addition to PACKAGE) when validating object types for
predefined
names.

iASL: Emit statistics for all output files (instead of just the ASL input
and
AML output). Includes listings, hex files, etc.

iASL: Added -G option to the table compiler to allow the compilation of
custom
ACPI tables. The only part of a table that is required is the standard
36-
byte
ACPI header.

AcpiXtract: Ported to the standard ACPICA environment (with ACPICA
headers),
which also adds correct 64-bit support. Also, now all output filenames
are
completely lower case.

AcpiExec: Ignore any non-AML tables (tables other than DSDT or SSDT) when
loading table files. A warning is issued for any such tables. The only
exception is an FADT. This also fixes a possible fault when attempting to

load
non-AML tables. ACPICA BZ 932.

AcpiHelp: Added the AccessAs and Offset operators. Fixed a problem where
a
missing table terminator could cause a fault when using the -p option.

AcpiSrc: Fixed a possible divide-by-zero fault when generating file
statistics.

3) Example Code and Data Size

These are the sizes for the OS-independent acpica.lib produced by the
Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code
includes the debug output trace mechanism and has a much larger code and
data
size.

```
  Previous Release (VC 9.0):
    Non-Debug Version:  90.2K Code, 23.9K Data, 114.1K Total
    Debug Version:     165.6K Code, 68.4K Data, 234.0K Total
  Current Release (VC 9.0):
    Non-Debug Version:  90.2K Code, 23.9K Data, 114.1K Total
    Debug Version:     165.6K Code, 68.4K Data, 234.0K Total
```

---

23 June 2011. Summary of changes for version 20110623:

1) ACPI CA Core Subsystem:

Updated the predefined name repair mechanism to not attempt repair of a
_TSS
return object if a _PSS object is present. We can only sort the _TSS
return
package if there is no _PSS within the same scope. This is because if
_PSS
is
present, the ACPI specification dictates that the _TSS Power Dissipation
field
is to be ignored, and therefore some BIOSs leave garbage values in the
_TSS
Power field(s). In this case, it is best to just return the _TSS package
as-
is. Reported by, and fixed with assistance from Fenghua Yu.

Added an option to globally disable the control method return value
validation
and repair. This runtime option can be used to disable return value
repair
if
this is causing a problem on a particular machine. Also added an option
to
AcpiExec (-dr) to set this disable flag.

All makefiles and project files: Major changes to improve generation of
ACPICA
tools. ACPICA BZ 912:

- Reduce default optimization levels to improve compatibility
- For Linux, add strict-aliasing=0 for gcc 4
- Cleanup and simplify use of command line defines
- Cleanup multithread library support
- Improve usage messages

Linux-specific header: update handling of THREAD_ID and pthread. For the
32-

bit case, improve casting to eliminate possible warnings, especially with
the
acpica tools.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
debug
version of the code includes the debug output trace mechanism and has a
much
larger code and data size.

```
  Previous Release (VC 9.0):
    Non-Debug Version:  90.1K Code, 23.9K Data, 114.0K Total
    Debug Version:     165.6K Code, 68.4K Data, 234.0K Total
  Current Release (VC 9.0):
    Non-Debug Version:  90.2K Code, 23.9K Data, 114.1K Total
    Debug Version:     165.6K Code, 68.4K Data, 234.0K Total
```

2) iASL Compiler/Disassembler and Tools:

With this release, a new utility named "acpihelp" has been added to the
ACPICA
package. This utility summarizes the ACPI specification chapters for the
ASL
and AML languages. It generates under Linux/Unix as well as Windows, and
provides the following functionality:

- Find/display ASL operator(s) -- with description and syntax.
- Find/display ASL keyword(s) -- with exact spelling and descriptions.
- Find/display ACPI predefined name(s) -- with description, number of arguments, and the return value data type.
- Find/display AML opcode name(s) -- with opcode, arguments, and grammar.
- Decode/display AML opcode -- with opcode name, arguments, and grammar.

Service Layers: Make multi-thread support configurable. Conditionally
compile
the multi-thread support so that threading libraries will not be linked
if
not
necessary. The only tool that requires multi-thread support is AcpiExec.

iASL: Update yyerrror/AslCompilerError for "const" errors. Newer versions
of
Bison appear to want the interface to yyerror to be a const char * (or at
least this is a problem when generating iASL on some systems.) ACPICA BZ
923
Pierre Lejeune.

Tools: Fix for systems where O_BINARY is not defined. Only used for
Windows
versions of the tools.

---

27 May 2011. Summary of changes for version 20110527:

1) ACPI CA Core Subsystem:

ASL Load() operator: Reinstate most restrictions on the incoming ACPI
table
8 *ASL Load() operator: Reinstate most restrictions on the incoming ACPI table*
signature. Now, only allow SSDT, OEMx, and a null signature. History:

1) Originally, we checked the table signature for "SSDT" or "PSDT". (PSDT is now obsolete.)
2) We added support for OEMx tables, signature "OEM" plus a fourth "don't care" character.

```
     3) Valid tables were encountered with a null signature, so we just
        gave up on validating the signature, (05/2008).
     4) We encountered non-AML tables such as the MADT, which caused
        interpreter errors and kernel faults. So now, we once again allow
        only SSDT, OEMx, and now, also a null signature. (05/2011).

Added the missing _TDL predefined name to the global name list in order to
enable validation. Affects both the core ACPICA code and the iASL compiler.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug
version of the code includes the debug output trace mechanism and has a much
larger code and data size.

   Previous Release (VC 9.0):
     Non-Debug Version:  90.0K Code, 23.8K Data, 113.8K Total
     Debug Version:     164.5K Code, 68.0K Data, 232.5K Total
   Current Release (VC 9.0):
     Non-Debug Version:  90.1K Code, 23.9K Data, 114.0K Total
     Debug Version:     165.6K Code, 68.4K Data, 234.0K Total

2) iASL Compiler/Disassembler and Tools:

Debugger/AcpiExec: Implemented support for "complex" method arguments on the
debugger command line. This adds support beyond simple integers -- including
Strings, Buffers, and Packages. Includes support for nested packages.
Increased the default command line buffer size to accommodate these
arguments.
See the ACPICA reference for details and syntax. ACPICA BZ 917.

Debugger/AcpiExec: Implemented support for "default" method arguments for the
Execute/Debug command. Now, the debugger will always invoke a control method
with the required number of arguments -- even if the command line specifies
none or insufficient arguments. It uses default integer values for any missing
arguments. Also fixes a bug where only six method arguments maximum were
supported instead of the required seven.

Debugger/AcpiExec: Add a maximum buffer length parameter to AcpiOsGetLine and
also return status in order to prevent buffer overruns. See the ACPICA
reference for details and syntax. ACPICA BZ 921

iASL: Cleaned up support for Berkeley yacc. A general cleanup of code and
makefiles to simplify support for the two different but similar parser
```

```
generators, bison and yacc.

Updated the generic unix makefile for gcc 4. The default gcc version is now
expected to be 4 or greater, since options specific to gcc 4 are used.

----------------------------------------
13 April 2011. Summary of changes for version 20110413:

1) ACPI CA Core Subsystem:

Implemented support to execute a so-called "orphan" _REG method under the
device. This change will force the execution of a _REG method underneath the
EC
device. This change will force the execution of a _REG method underneath the
EC
device even if there is no corresponding operation region of type
EmbeddedControl. Fixes a problem seen on some machines and apparently is
compatible with Windows behavior. ACPICA BZ 875.

Added more predefined methods that are eligible for automatic NULL package
element removal. This change adds another group of predefined names to the
list
of names that can be repaired by having NULL package elements dynamically
removed. This group are those methods that return a single variable-length
package containing simple data types such as integers, buffers, strings. This
includes: _ALx, _BCL, _CID,_ DOD, _EDL, _FIX, _PCL, _PLD, _PMD, _PRx, _PSL,
_Sx,
and _TZD. ACPICA BZ 914.

Split and segregated all internal global lock functions to a new file,
evglock.c.

Updated internal address SpaceID for DataTable regions. Moved this internal
space
id in preparation for ACPI 5.0 changes that will include some new space IDs.
This
change should not affect user/host code.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib
produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of
the code includes the debug output trace mechanism and has a much larger code
and
data size.
```

```
   Previous Release (VC 9.0):
     Non-Debug Version:  89.8K Code, 23.8K Data, 113.6K Total
     Debug Version:     164.2K Code, 67.9K Data, 232.1K Total
   Current Release (VC 9.0):
     Non-Debug Version:  90.0K Code, 23.8K Data, 113.8K Total
     Debug Version:     164.5K Code, 68.0K Data, 232.5K Total

2) iASL Compiler/Disassembler and Tools:

iASL/DTC: Major update for new grammar features. Allow generic data types in
custom ACPI tables. Field names are now optional. Any line can be split to
multiple lines using the continuation char (\). Large buffers now use line-
continuation character(s) and no colon on the continuation lines. See the
grammar
update in the iASL compiler reference. ACPI BZ 910,911. Lin Ming, Bob Moore.
 iASL/DTC: Major update for new grammar features. Allow generic data types in
 custom ACPI tables. Field names are now optional. Any line can be split to
 multiple lines using the continuation char (\). Large buffers now use line-
 update in the iASL compiler reference. ACPI BZ 910,911. Lin Ming, Bob Moore.

iASL: Mark ASL "Return()" and the simple "Return" as "Null" return
statements.
Since the parser stuffs a "zero" as the return value for these statements
(due
to
the underlying AML grammar), they were seen as "return with value" by the
iASL
semantic checking. They are now seen correctly as "null" return
statements.
 iASL: Mark ASL "Return()" and the simple "Return" as "Null" return statements.
 Since the parser stuffs a "zero" as the return value for these statements (due
 the underlying AML grammar), they were seen as "return with value" by the iASL
 semantic checking. They are now seen correctly as "null" return statements.

iASL: Check if a_REG declaration has a corresponding Operation Region.
Adds a
check for each _REG to ensure that there is in fact a corresponding
operation
 iASL: Check if a_REG declaration has a corresponding Operation Region. Adds a
 check for each _REG to ensure that there is in fact a corresponding operation
region declaration in the same scope. If not, the _REG method is not very
useful
since it probably won't be executed. ACPICA BZ 915.

iASL/DTC: Finish support for expression evaluation. Added a new
expression
 iASL/DTC: Finish support for expression evaluation. Added a new expression
parser
that implements c-style operator precedence and parenthesization. ACPICA
bugzilla
908.

Disassembler/DTC: Remove support for () and <> style comments in data
tables.

2731 comment
 191 AcpiXtract: Correctly handle embedded comments and messages from AcpiDump.
 192 Apparently some or all versions of acpidump will occasionally emit a comment
2732 like
2733 "Wrong checksum", etc., into the dump file. This was causing problems for
2734 AcpiXtract. ACPICA BZ 905.

2736 iASL: Fix the Linux makefile by removing an inadvertent double file
2737 inclusion.
 197 iASL: Fix the Linux makefile by removing an inadvertent double file inclusion.
2738 ACPICA BZ 913.

2740 AcpiExec: Update installation of operation region handlers. Install one
2741 handler
2742 for a user-defined address space. This is used by the ASL test suite
2743 (ASLTS).
 202 for a user-defined address space. This is used by the ASL test suite (ASLTS).

2745 ----------------------------------------
2746 11 February 2011. Summary of changes for version 20110211:

2748 1) ACPI CA Core Subsystem:

2750 Added a mechanism to defer _REG methods for some early-installed
2751 handlers.
2752 Most user handlers should be installed before call to
2753 AcpiEnableSubsystem.
 209 Added a mechanism to defer _REG methods for some early-installed handlers.
 210 Most user handlers should be installed before call to AcpiEnableSubsystem.
2754 However, Event handlers and region handlers should be installed after
2755 AcpiInitializeObjects. Override handlers for the "default" regions should
2756 be
 212 AcpiInitializeObjects. Override handlers for the "default" regions should be
2757 installed early, however. This change executes all _REG methods for the
2758 default regions (Memory/IO/PCI/DataTable) simultaneously to prevent any
2759 chicken/egg issues between them. ACPICA BZ 848.

2761 Implemented an optimization for GPE detection. This optimization will
2762 simply
 217 Implemented an optimization for GPE detection. This optimization will simply
2763 ignore GPE registers that contain no enabled GPEs -- there is no need to
2764 read the register since this information is available internally. This
2765 becomes more important on machines with a large GPE space. ACPICA
2766 bugzilla
```

```
 220 becomes more important on machines with a large GPE space. ACPICA bugzilla
2767 884. Lin Ming. Suggestion from Joe Liu.

2769 Removed all use of the highly unreliable FADT revision field. The
2770 revision
2771 number in the FADT has been found to be completely unreliable and cannot
2772 be
2773 trusted. Only the actual table length can be used to infer the version.

13 October 2010. Summary of changes for version 20101013:

1) ACPI CA Core Subsystem:

Added support to clear the PCIEXP_WAKE event. When clearing ACPI events,
now
Added support to clear the PCIEXP_WAKE event. When clearing ACPI events, now
clear the PCIEXP_WAKE_STS bit in the ACPI PM1 Status Register, via
HwClearAcpiStatus. Original change from Colin King. ACPICA BZ 880.

Changed the type of the predefined namespace object _TZ from ThermalZone
to
Device. This was found to be confusing to the host software that
processes
the various thermal zones, since _TZ is not really a ThermalZone.
However,
a
Changed the type of the predefined namespace object _TZ from ThermalZone to
Device. This was found to be confusing to the host software that processes

the various thermal zones, since _TZ is not really a ThermalZone. However, a
Notify() can still be performed on it. ACPICA BZ 876. Suggestion from Rui
Zhang.

Added Windows Vista SP2 to the list of supported _OSI strings. The actual
string is "Windows 2006 SP2".

Eliminated duplicate code in AcpiUtExecute* functions. Now that the
nsrepair
Eliminated duplicate code in AcpiUtExecute functions. Now that the nsrepair*
code automatically repairs _HID-related strings, this type of code is no
longer needed in Execute_HID, Execute_CID, and Execute_UID. ACPICA BZ
878.
longer needed in Execute_HID, Execute_CID, and Execute_UID. ACPICA BZ 878.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  89.9K Code, 19.0K Data, 108.9K Total
    Debug Version:     166.3K Code, 52.1K Data, 218.4K Total
  Current Release:

    Debug Version:     166.3K Code, 52.1K Data, 218.4K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented additional compile-time validation for _HID strings.
The
non-hex prefix (such as "PNP" or "ACPI") must be uppercase, and the
length
of
the string must be exactly seven or eight characters. For both _HID and
_CID
iASL: Implemented additional compile-time validation for _HID strings. The
non-hex prefix (such as "PNP" or "ACPI") must be uppercase, and the length of
the string must be exactly seven or eight characters. For both _HID and _CID
strings, all characters must be alphanumeric. ACPICA BZ 874.

iASL: Allow certain "null" resource descriptors. Some BIOS code creates
descriptors that are mostly or all zeros, with the expectation that they
will
be filled in at runtime. iASL now allows this as long as there is a
"resource
descriptors that are mostly or all zeros, with the expectation that they will
be filled in at runtime. iASL now allows this as long as there is a "resource
tag" (name) associated with the descriptor, which gives the ASL a handle
needed to modify the descriptor. ACPICA BZ 873.

Added single-thread support to the generic Unix application OSL.

for iASL support, this change removes the use of semaphores in the
single-
Added single-thread support to the generic Unix application OSL. Primarily
for iASL support, this change removes the use of semaphores in the single-
threaded ACPICA tools/applications - increasing performance. The
_MULTI_THREADED option was replaced by the (reverse) ACPI_SINGLE_THREADED
option. ACPICA BZ 879.

AcpiExec: several fixes for the 64-bit version. Adds XSDT support and
support
AcpiExec: several fixes for the 64-bit version. Adds XSDT support and support

for 64-bit DSDT/FACS addresses in the FADT. Lin Ming.

iASL: Moved all compiler messages to a new file, aslmessages.h.

---
15 September 2010. Summary of changes for version 20100915:

1) ACPI CA Core Subsystem:

Removed the AcpiOsDerivePciId OSL interface. The various host
implementations
Removed the AcpiOsDerivePciId OSL interface. The various host implementations
of this function were not OS-dependent and are now obsolete and can be
removed from all host OSLs. This function has been replaced by
AcpiHwDerivePciId, which is now part of the ACPICA core code.
AcpiHwDerivePciId has been implemented without recursion. Adds one new
module, hwpci.c. ACPICA BZ 857.

Implemented a dynamic repair for _HID and _CID strings. The following
problems are now repaired at runtime: 1) Remove a leading asterisk in the
string, and 2) the entire string is uppercased. Both repairs are in
accordance with the ACPI specification and will simplify host driver
code.
accordance with the ACPI specification and will simplify host driver code.
ACPICA BZ 871.

The ACPI_THREAD_ID type is no longer configurable, internally it is now
always UINT64. This simplifies the ACPICA code, especially any printf
output.
always UINT64. This simplifies the ACPICA code, especially any printf output.
UINT64 is the only common data type for all thread_id types across all
operating systems. It is now up to the host OSL to cast the native
thread_id
type to UINT64 before returning the value to ACPICA (via
AcpiOsGetThreadId).
operating systems. It is now up to the host OSL to cast the native thread_id
type to UINT64 before returning the value to ACPICA (via AcpiOsGetThreadId).
Lin Ming, Bob Moore.

Added the ACPI_INLINE type to enhance the ACPICA configuration. The
"inline"
keyword is not standard across compilers, and this type allows inline to

06 August 2010. Summary of changes for version 20100806:

1) ACPI CA Core Subsystem:

**Designed and implemented a new host interface to the _OSI support code.
This
will allow the host to dynamically add or remove multiple _OSI strings,
as
well as install an optional handler that is called for each _OSI
invocation.
Also added a new AML debugger command, 'osi' to display and modify the
global
_OSI string table, and test support in the AcpiExec utility. See the
ACPICA**
*Designed and implemented a new host interface to the _OSI support code. This
will allow the host to dynamically add or remove multiple _OSI strings, as
well as install an optional handler that is called for each _OSI invocation.
Also added a new AML debugger command, 'osi' to display and modify the global
_OSI string table, and test support in the AcpiExec utility. See the ACPICA*
reference manual for full details. Lin Ming, Bob Moore. ACPICA BZ 836.
New Functions:
    AcpiInstallInterface - Add an _OSI string.
    AcpiRemoveInterface - Delete an _OSI string.
    AcpiInstallInterfaceHandler - Install optional _OSI handler.
Obsolete Functions:
    AcpiOsValidateInterface - no longer used.
New Files:
    source/components/utilities/utosi.c

Re-introduced the support to enable multi-byte transfers for Embedded

Lin Ming.

---

02 July 2010. Summary of changes for version 20100702:

1) ACPI CA Core Subsystem:

Implemented several updates to the recently added GPE reference count support. The model for "wake" GPEs is changing to give the host OS complete control of these GPEs. Eventually, the ACPICA core will not execute any _PRW methods, since the host already must execute them. Also, additional changes were made to help ensure that the reference counts are kept in proper synchronization with reality. Rafael J. Wysocki.

1) Ensure that GPEs are not enabled twice during initialization.
2) Ensure that GPE enable masks stay in sync with the reference count.
3) Do not inadvertently enable GPEs when writing GPE registers.
4) Remove the internal wake reference counter and add new AcpiGpeWakeup interface. This interface will set or clear individual GPEs for wakeup.
5) Remove GpeType argument from AcpiEnable and AcpiDisable. These interfaces are now used for "runtime" GPEs only.

Changed the behavior of the GPE install/remove handler interfaces. The GPE is no longer disabled during this process, as it was found to cause problems on some machines. Rafael J. Wysocki.

Reverted a change introduced in version 20100528 to enable Embedded Controller multi-byte transfers. This change was found to cause problems with Index Fields and possibly Bank Fields. It will be reintroduced when these problems have been resolved.

Fixed a problem with references to Alias objects within Package Objects. A reference to an Alias within the definition of a Package was not always resolved properly. Aliases to objects like Processors, Thermal zones, etc. were resolved to the actual object instead of a reference to the object as it should be. Package objects are only allowed to contain integer, string, buffer, package, and reference objects. Redhat bugzilla 608648.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

  Previous Release:
    Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total

    Debug Version: 164.1K Code, 51.5K Data, 215.6K Total
  Current Release:
    Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total
    Debug Version: 164.0K Code, 51.5K Data, 215.5K Total

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented a new compiler subsystem to allow definition and compilation of the non-AML ACPI tables such as FADT, MADT, SRAT, etc. These are called "ACPI Data Tables", and the new compiler is the "Data Table Compiler". This compiler is intended to simplify the existing error-prone process of creating these tables for the BIOS, as well as allowing the disassembly, modification, recompilation, and override of existing ACPI data tables. See the iASL User Guide for detailed information.

iASL: Implemented a new Template Generator option in support of the new Data Table Compiler. This option will create examples of all known ACPI tables that can be used as the basis for table development. See the iASL documentation and the -T option.

Disassembler and headers: Added support for the WDDT ACPI table (Watchdog Descriptor Table).

Updated the Linux makefiles for iASL and AcpiExec to place the generated object files in the local directory so that there can be no collisions between the shared files between them that are generated with different options.

Added support for Mac OS X in the Unix OSL used for iASL and AcpiExec. Use the #define __APPLE__ to enable this support.

---

28 May 2010. Summary of changes for version 20100528:

Note: The ACPI 4.0a specification was released on April 5, 2010 and is available at www.acpi.info. This is primarily an errata release.

1) ACPI CA Core Subsystem:

Undefined ACPI tables: We are looking for the definitions for the following ACPI tables that have been seen in the field: ATKG, IEIT, GSCI.

Implemented support to enable multi-byte transfers for Embedded Controller (EC) operation regions. Previously, the maximum data size passed to the EC operation region handler was a single byte. There are often EC Fields larger than one byte that need to be transferred, and it is useful for the EC driver to lock these as a single transaction. This change enables single transfers larger than 8 bits. This effectively changes the access to the EC space from ByteAcc to AnyAcc, and will probably require changes to the host OS Embedded

Controller driver to enable 16/32/64/256-bit transfers in addition to 8-bit
Implemented support to enable multi-byte transfers for Embedded Controller (EC) operation regions. Previously, the maximum data size passed to the EC operation region handler was a single byte. There are often EC Fields larger than one byte that need to be transferred, and it is useful for the EC driver to lock these as a single transaction. This change enables single transfers larger than 8 bits. This effectively changes the access to the EC space from ByteAcc to AnyAcc, and will probably require changes to the host OS Embedded Controller driver to enable 16/32/64/256-bit transfers in addition to 8-bit
transfers. Alexey Starikovskiy, Lin Ming

Implemented a performance enhancement for namespace search and access. This change enhances the performance of namespace searches and walks by adding a backpointer to the parent in each namespace node. On large namespaces, this change can improve overall ACPI performance by up to 9X. Adding a pointer to each namespace node increases the overall size of the internal namespace by
Implemented a performance enhancement for namespace search and access. This change enhances the performance of namespace searches and walks by adding a backpointer to the parent in each namespace node. On large namespaces, this change can improve overall ACPI performance by up to 9X. Adding a pointer to each namespace node increases the overall size of the internal namespace by
about 5%, since each namespace entry usually consists of both a namespace node and an ACPI operand object. However, this is the first growth of the namespace in ten years. ACPICA bugzilla 817. Alexey Starikovskiy.

Implemented a performance optimization that reduces the number of namespace walks. On control method exit, only walk the namespace if the method is known to have created namespace objects outside of its local scope. Previously, the entire namespace was traversed on each control method exit. This change can improve overall ACPI performance by up to 3X. Alexey Starikovskiy, Bob Moore.
Implemented a performance optimization that reduces the number of namespace walks. On control method exit, only walk the namespace if the method is known to have created namespace objects outside of its local scope. Previously, the entire namespace was traversed on each control method exit. This change can improve overall ACPI performance by up to 3X. Alexey Starikovskiy, Bob Moore.

Added support to truncate I/O addresses to 16 bits for Windows compatibility.
Added support to truncate I/O addresses to 16 bits for Windows compatibility.
Some ASL code has been seen in the field that inadvertently has bits set **above bit 15. This feature is optional and is enabled if the BIOS requests**
above bit 15. This feature is optional and is enabled if the BIOS requests
any Windows OSI strings. It can also be enabled by the host OS. Matthew Garrett, Bob Moore.

Added support to limit the maximum time for the ASL Sleep() operator. To prevent accidental deep sleeps, limit the maximum time that Sleep() will actually sleep. Configurable, the default maximum is two seconds. ACPICA bugzilla 854.

Added run-time validation support for the _WDG and_WED Microsoft predefined methods. These objects are defined by "Windows Instrumentation", and are not

Added run-time validation support for the _WDG and_WED Microsoft predefined methods. These objects are defined by "Windows Instrumentation", and are not
part of the ACPI spec. ACPICA BZ 860.

Expanded all statistic counters used during namespace and device **initialization from 16 to 32 bits in order to support very large namespaces.**
initialization from 16 to 32 bits in order to support very large namespaces.

Replaced all instances of %d in printf format specifiers with %u since nearly
Replaced all instances of %d in printf format specifiers with %u since nearly
all integers in ACPICA are unsigned.

Fixed the exception namestring for AE_WAKE_ONLY_GPE. Was incorrectly returned
Fixed the exception namestring for AE_WAKE_ONLY_GPE. Was incorrectly returned
as AE_NO_HANDLER.

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented Min/Max/Len/Gran validation for address resource
descriptors. This change implements validation for the address fields
that
descriptors. This change implements validation for the address fields that
are common to all address-type resource descriptors. These checks are
implemented: Checks for valid Min/Max, length within the Min/Max window,
valid granularity, Min/Max a multiple of granularity, and _MIF/_MAF as
per
table 6-40 in the ACPI 4.0a specification. Also split the large
aslrestype1.c
valid granularity, Min/Max a multiple of granularity, and _MIF/_MAF as per
table 6-40 in the ACPI 4.0a specification. Also split the large aslrestype1.c
and aslrestype2.c files into five new files. ACPICA BZ 840.

iASL: Added support for the _Wxx predefined names. This support was
missing
iASL: Added support for the _Wxx predefined names. This support was missing
and these names were not recognized by the compiler as valid predefined
names. ACPICA BZ 851.

iASL: Added an error for all predefined names that are defined to return
no
value and thus must be implemented as Control Methods. These include all
of
iASL: Added an error for all predefined names that are defined to return no
value and thus must be implemented as Control Methods. These include all of

the _Lxx, _Exx, _Wxx, and _Qxx names, as well as some other miscellaneous
names such as _DIS, _INI, _IRC, _OFF, _ON, and _PSx. ACPICA BZ 850, 856.

iASL: Implemented the -ts option to emit hex AML data in ASL format, as
an
ASL Buffer. Allows ACPI tables to be easily included within ASL files, to
be
dynamically loaded via the Load() operator. Also cleaned up output for
the
-
iASL: Implemented the -ts option to emit hex AML data in ASL format, as an
ASL Buffer. Allows ACPI tables to be easily included within ASL files, to be
dynamically loaded via the Load() operator. Also cleaned up output for the -
ta and -tc options. ACPICA BZ 853.

Tests: Added a new file with examples of extended iASL error checking.
Demonstrates the advanced error checking ability of the iASL compiler.
Available at tests/misc/badcode.asl.

---
31 March 2010. Summary of changes for version 20100331:

1) ACPI CA Core Subsystem:

Completed a major update for the GPE support in order to improve support
for
shared GPEs and to simplify both host OS and ACPICA code. Added a
reference
count mechanism to support shared GPEs that require multiple device
drivers.
Completed a major update for the GPE support in order to improve support for
shared GPEs and to simplify both host OS and ACPICA code. Added a reference
count mechanism to support shared GPEs that require multiple device drivers.
Several external interfaces have changed. One external interface has been
removed. One new external interface was added. Most of the GPE external
interfaces now use the GPE spinlock instead of the events mutex (and the
Flags parameter for many GPE interfaces has been removed.) See the
updated
ACPICA Programmer Reference for details. Matthew Garrett, Bob Moore,
Rafael
Flags parameter for many GPE interfaces has been removed.) See the updated
ACPICA Programmer Reference for details. Matthew Garrett, Bob Moore, Rafael
Wysocki. ACPICA BZ 831.

```
Changed:
    AcpiEnableGpe, AcpiDisableGpe, AcpiClearGpe, AcpiGetGpeStatus
Removed:
    AcpiSetGpeType
New:
    AcpiSetGpe
```

Implemented write support for DataTable operation regions. These regions
are
defined via the DataTableRegion() operator. Previously, only read support
was
implemented. The ACPI specification allows DataTableRegions to be
read/write,
Implemented write support for DataTable operation regions. These regions are
defined via the DataTableRegion() operator. Previously, only read support was
implemented. The ACPI specification allows DataTableRegions to be read/write,
however.

Implemented a new subsystem option to force a copy of the DSDT to local
memory. Optionally copy the entire DSDT to local memory (instead of
simply
mapping it.) There are some (albeit very rare) BIOSs that corrupt or

replace
the original DSDT, creating the need for this option. Default is FALSE,
do
memory. Optionally copy the entire DSDT to local memory (instead of simply
mapping it.) There are some (albeit very rare) BIOSs that corrupt or replace
the original DSDT, creating the need for this option. Default is FALSE, do
not copy the DSDT.

Implemented detection of a corrupted or replaced DSDT. This change adds
support to detect a DSDT that has been corrupted and/or replaced from
outside
the OS (by firmware). This is typically catastrophic for the system, but
has
support to detect a DSDT that has been corrupted and/or replaced from outside
the OS (by firmware). This is typically catastrophic for the system, but has
been seen on some machines. Once this problem has been detected, the DSDT
copy option can be enabled via system configuration. Lin Ming, Bob Moore.

Fixed two problems with AcpiReallocateRootTable during the root table
copy.
Fixed two problems with AcpiReallocateRootTable during the root table copy.
When copying the root table to the new allocation, the length used was
incorrect. The new size was used instead of the current table size,
meaning
too much data was copied. Also, the count of available slots for ACPI
tables
incorrect. The new size was used instead of the current table size, meaning
too much data was copied. Also, the count of available slots for ACPI tables
was not set correctly. Alexey Starikovskiy, Bob Moore.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  87.5K Code, 18.4K Data, 105.9K Total
    Debug Version:     163.4K Code, 51.1K Data, 214.5K Total
  Current Release:
    Non-Debug Version:  87.9K Code, 18.6K Data, 106.5K Total
    Debug Version:     163.5K Code, 51.3K Data, 214.8K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Implement limited typechecking for values returned from predefined
control methods. The type of any returned static (unnamed) object is now
validated. For example, Return(1). ACPICA BZ 786.

iASL: Fixed a predefined name object verification regression. Fixes a
problem
iASL: Fixed a predefined name object verification regression. Fixes a problem
introduced in version 20100304. An error is incorrectly generated if a
predefined name is declared as a static named object with a value defined
using the keywords "Zero", "One", or "Ones". Lin Ming.

iASL: Added Windows 7 support for the -g option (get local ACPI tables)
by
iASL: Added Windows 7 support for the -g option (get local ACPI tables) by
reducing the requested registry access rights. ACPICA BZ 842.

Disassembler: fixed a possible fault when generating External()
statements.
Introduced in commit ae7d6fd: Properly handle externals with parent-
prefix

Disassembler: fixed a possible fault when generating External() statements.
Introduced in commit ae7d6fd: Properly handle externals with parent-prefix
(carat). Fixes a string length allocation calculation. Lin Ming.

---
04 March 2010. Summary of changes for version 20100304:

1) ACPI CA Core Subsystem:

Fixed a possible problem with the AML Mutex handling function
AcpiExReleaseMutex where the function could fault under the very rare
condition when the interpreter has blocked, the interpreter lock is
released,
condition when the interpreter has blocked, the interpreter lock is released,
the interpreter is then reentered via the same thread, and attempts to
acquire an AML mutex that was previously acquired. FreeBSD report 140979.
Lin
acquire an AML mutex that was previously acquired. FreeBSD report 140979. Lin
Ming.

Implemented additional configuration support for the AML "Debug Object".
Output from the debug object can now be enabled via a global variable,
AcpiGbl_EnableAmlDebugObject. This will assist with remote machine
debugging.
This debug output is now available in the release version of ACPICA
instead
of just the debug version. Also, the entire debug output module can now
be
AcpiGbl_EnableAmlDebugObject. This will assist with remote machine debugging.
This debug output is now available in the release version of ACPICA instead
of just the debug version. Also, the entire debug output module can now be
configured out of the ACPICA build if desired. One new file added,
executer/exdebug.c. Lin Ming, Bob Moore.

Added header support for the ACPI MCHI table (Management Controller Host
Interface Table). This table was added in ACPI 4.0, but the defining
document
Interface Table). This table was added in ACPI 4.0, but the defining document
has only recently become available.

Standardized output of integer values for ACPICA warnings/errors. Always
use
0x prefix for hex output, always use %u for unsigned integer decimal
output.
Affects ACPI_INFO, ACPI_ERROR, ACPI_EXCEPTION, and ACPI_WARNING (about

```

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented typechecking support for static (non-control method)
predefined named objects that are declared with the Name() operator. For
example, the type of this object is now validated to be of type Integer:
Name(_BBN, 1). This change migrates the compiler to using the core
predefined
Name(_BBN, 1). This change migrates the compiler to using the core predefined
name table instead of maintaining a local version. Added a new file,
aslpredef.c. ACPICA BZ 832.

Disassembler: Added support for the ACPI 4.0 MCHI table.

---
21 January 2010. Summary of changes for version 20100121:

1) ACPI CA Core Subsystem:

Added the 2010 copyright to all module headers and signons. This affects
virtually every file in the ACPICA core subsystem, the iASL compiler, the
tools/utilities, and the test suites.

Implemented a change to the AcpiGetDevices interface to eliminate
unnecessary
Implemented a change to the AcpiGetDevices interface to eliminate unnecessary
invocations of the _STA method. In the case where a specific _HID is
requested, do not run _STA until a _HID match is found. This eliminates
potentially dozens of _STA calls during a search for a particular
device/HID,
potentially dozens of _STA calls during a search for a particular device/HID,
which in turn can improve boot times. ACPICA BZ 828. Lin Ming.

Implemented an additional repair for predefined method return values.
Attempt
to repair unexpected NULL elements within returned Package objects.
Create
an
Integer of value zero, a NULL String, or a zero-length Buffer as
appropriate.
Implemented an additional repair for predefined method return values. Attempt
to repair unexpected NULL elements within returned Package objects. Create an
Integer of value zero, a NULL String, or a zero-length Buffer as appropriate.
ACPICA BZ 818. Lin Ming, Bob Moore.

Removed the obsolete ACPI_INTEGER data type. This type was introduced as
the
code was migrated from ACPI 1.0 (with 32-bit AML integers) to ACPI 2.0
(with
64-bit AML integers). It is now obsolete and this change removes it from
the
ACPICA code base, replaced by UINT64. The original typedef has been
retained
for now for compatibility with existing device driver code. ACPICA BZ
824.

2) iASL Compiler/Disassembler and Tools:

iASL: Implemented Switch() with While(1) so that Break works correctly. This change correctly implements the Switch operator with a surrounding While(1)
iASL: Implemented Switch() with While(1) so that Break works correctly. This change correctly implements the Switch operator with a surrounding While(1) so that the Break operator works as expected. ACPICA BZ 461. Lin Ming.

iASL: Added a message if a package initializer list is shorter than package length. Adds a new remark for a Package() declaration if an initializer list
iASL: Added a message if a package initializer list is shorter than package length. Adds a new remark for a Package() declaration if an initializer list exists, but is shorter than the declared length of the package. Although technically legal, this is probably a coding error and it is seen in the field. ACPICA BZ 815. Lin Ming, Bob Moore.

iASL: Fixed a problem where the compiler could fault after the maximum number
iASL: Fixed a problem where the compiler could fault after the maximum number of errors was reached (200).

acpixtract: Fixed a possible warning for pointer cast if the compiler warning
acpixtract: Fixed a possible warning for pointer cast if the compiler warning level set very high.

---

13 October 2009. Summary of changes for version 20091013:

1) ACPI CA Core Subsystem:

Fixed a problem where an Operation Region _REG method could be executed more than once. If a custom address space handler is installed by the host before the "initialize operation regions" phase of the ACPICA initialization, any
Fixed a problem where an Operation Region _REG method could be executed more than once. If a custom address space handler is installed by the host before the "initialize operation regions" phase of the ACPICA initialization, any _REG methods for that address space could be executed twice. This change fixes the problem. ACPICA BZ 427. Lin Ming.

Fixed a possible memory leak for the Scope() ASL operator. When the exact invocation of "Scope(\)" is executed (change scope to root), one internal operand object was leaked. Lin Ming.

Implemented a run-time repair for the _MAT predefined method. If the _MAT return value is defined as a Field object in the AML, and the field **size is less than or equal to the default width of an integer (32 or 64),_MAT**
size is less than or equal to the default width of an integer (32 or 64),_MAT can incorrectly return an Integer instead of a Buffer. ACPICA now automatically repairs this problem. ACPICA BZ 810.

Implemented a run-time repair for the _BIF and _BIX predefined methods. The
Implemented a run-time repair for the _BIF and _BIX predefined methods. The "OEM Information" field is often incorrectly returned as an Integer with **value zero if the field is not supported by the platform. This is due to an**
value zero if the field is not supported by the platform. This is due to an ambiguity in the ACPI specification. The field should always be a string. ACPICA now automatically repairs this problem by returning a NULL string within the returned Package. ACPICA BZ 807.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The **debug version of the code includes the debug output trace mechanism and has a**
debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

    Debug Version:     161.8K Code, 50.6K Data, 212.4K Total
```

2) iASL Compiler/Disassembler and Tools:

Disassembler: Fixed a problem where references to external symbols that **contained one or more parent-prefixes (carats) were not handled correctly,**
contained one or more parent-prefixes (carats) were not handled correctly, possibly causing a fault. ACPICA BZ 806. Lin Ming.

Disassembler: Restructured the code so that all functions that handle external symbols are in a single module. One new file is added, common/dmextern.c.

AML Debugger: Added a max count argument for the Batch command (which executes multiple predefined methods within the namespace.)

iASL: Updated the compiler documentation (User Reference.) Available at http://www.acpica.org/documentation/. ACPICA BZ 750.

AcpiXtract: Updated for Lint and other formatting changes. Close all open files.

---

03 September 2009. Summary of changes for version 20090903:

1) ACPI CA Core Subsystem:

For Windows Vista compatibility, added the automatic execution of an _INI method located at the namespace root (_INI). This method is executed at table load time. This support is in addition to the automatic execution of *table load time. This support is in addition to the automatic execution of* _SB._INI. Lin Ming.

Fixed a possible memory leak in the interpreter for AML package objects if the package initializer list is longer than the defined size of the package. This apparently can only happen if the BIOS changes the package size on the *Fixed a possible memory leak in the interpreter for AML package objects if the package initializer list is longer than the defined size of the package. This apparently can only happen if the BIOS changes the package size on the* fly (seen in a _PSS object), as ASL compilers do not allow this. The interpreter will truncate the package to the defined size (and issue an error message), but previously could leave the extra objects undeleted if they were pre-created during the argument processing (such is the case if the package *interpreter will truncate the package to the defined size (and issue an error message), but previously could leave the extra objects undeleted if they were pre-created during the argument processing (such is the case if the package* consists of a number of sub-packages as in the _PSS.) ACPICA BZ 805.

Fixed a problem seen when a Buffer or String is stored to itself via ASL. This has been reported in the field. Previously, ACPICA would zero out the *This has been reported in the field. Previously, ACPICA would zero out the* buffer/string. Now, the operation is treated as a noop. Provides Windows compatibility. ACPICA BZ 803. Lin Ming.

Removed an extraneous error message for ASL constructs of the form Store(LocalX,LocalX) when LocalX is uninitialized. These curious statements are seen in many BIOSs and are once again treated as NOOPs and no error is *Store(LocalX,LocalX) when LocalX is uninitialized. These curious statements are seen in many BIOSs and are once again treated as NOOPs and no error is* emitted when they are encountered. ACPICA BZ 785.

Fixed an extraneous warning message if a _DSM reserved method returns a Package object. _DSM can return any type of object, so validation on the return type cannot be performed. ACPICA BZ 802.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a *debug version of the code includes the debug output trace mechanism and has a* much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  85.5K Code, 18.0K Data, 103.5K Total

    Debug Version:     161.7K Code, 50.9K Data, 212.6K Total
```

2) iASL Compiler/Disassembler and Tools:

iASL: Fixed a problem with the use of the Alias operator and Resource Templates. The correct alias is now constructed and no error is emitted. ACPICA BZ 738.

iASL: Implemented the -I option to specify additional search directories for *iASL: Implemented the -I option to specify additional search directories for* include files. Allows multiple additional search paths for include files. Directories are searched in the order specified on the command line (after *Directories are searched in the order specified on the command line (after* the local directory is searched.) ACPICA BZ 800.

iASL: Fixed a problem where the full pathname for include files was not emitted for warnings/errors. This caused the IDE support to not work properly. ACPICA BZ 765.

iASL: Implemented the -@ option to specify a Windows-style response file containing additional command line options. ACPICA BZ 801.

AcpiExec: Added support to load multiple AML files simultaneously (such as a *AcpiExec: Added support to load multiple AML files simultaneously (such as a* DSDT and multiple SSDTs). Also added support for wildcards within the AML pathname. These features allow all machine tables to be easily loaded and debugged together. ACPICA BZ 804.

Disassembler: Added missing support for disassembly of HEST table Error Bank *Disassembler: Added missing support for disassembly of HEST table Error Bank* subtables.

---

30 July 2009. Summary of changes for version 20090730:

The ACPI 4.0 implementation for ACPICA is complete with this release.

1) ACPI CA Core Subsystem:

ACPI 4.0: Added header file support for all new and changed ACPI tables. Completely new tables are: IBFT, IVRS, MSCT, and WAET. Tables that are new for ACPI 4.0, but have previously been supported in ACPICA are: CPEP, BERT, EINJ, ERST, and HEST. Other newly supported tables are: UEFI and WDAT. There *Completely new tables are: IBFT, IVRS, MSCT, and WAET. Tables that are new for ACPI 4.0, but have previously been supported in ACPICA are: CPEP, BERT, EINJ, ERST, and HEST. Other newly supported tables are: UEFI and WDAT. There* have been some ACPI 4.0 changes to other existing tables. Split the large actbl1.h header into the existing actbl2.h header. ACPICA BZ 774.

ACPI 4.0: Implemented predefined name validation for all new names. There are 31 new names in ACPI 4.0. The predefined validation module was split into two *ACPI 4.0: Implemented predefined name validation for all new names. There are 31 new names in ACPI 4.0. The predefined validation module was split into two* files. The new file is namespace/nsrepair.c. ACPICA BZ 770.

Implemented support for so-called "module-level executable code". This is executable AML code that exists outside of any control method and is intended to be executed at table load time. Although illegal since ACPI 2.0, this type of code still exists and is apparently still being created. Blocks of this code are now detected and executed as intended. Currently, the code blocks must exist under either an If, Else, or While construct; these are the typical cases seen in the field. ACPICA BZ 762. Lin Ming.

Implemented an automatic dynamic repair for predefined names that return nested Package objects. This applies to predefined names that are defined to return a variable-length Package of sub-packages. If the number of sub-packages is one, BIOS code is occasionally seen that creates a simple single package with no sub-packages. This code attempts to fix the problem by wrapping a new package object around the existing package. These methods can be repaired: _ALR, _CSD, _HPX, _MLS, _PRT, _PSS, _TRT, and _TSS. ACPICA BZ 790.

Fixed a regression introduced in 20090625 for the AcpiGetDevices interface. The _HID/_CID matching was broken and no longer matched IDs correctly. ACPICA BZ 793.

Fixed a problem with AcpiReset where the reset would silently fail if the register was one of the protected I/O ports. AcpiReset now bypasses the port validation mechanism. This may eventually be driven into the AcpiRead/Write interfaces.

Fixed a regression related to the recent update of the AcpiRead/Write interfaces. A sleep/suspend could fail if the optional PM2 Control register does not exist during an attempt to write the Bus Master Arbitration bit. (However, some hosts already delete the code that writes this bit, and the code may in fact be obsolete at this date.) ACPICA BZ 799.

Fixed a problem where AcpiTerminate could fault if inadvertently called twice in succession. ACPICA BZ 795.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  84.7K Code, 17.8K Data, 102.5K Total
    Debug Version:     160.5K Code, 50.6K Data, 211.1K Total
  Current Release:
    Non-Debug Version:  85.5K Code, 18.0K Data, 103.5K Total
    Debug Version:     161.6K Code, 50.9K Data, 212.5K Total
```

2) iASL Compiler/Disassembler and Tools:

ACPI 4.0: Implemented disassembler support for all new ACPI tables and changes to existing tables. ACPICA BZ 775.

---

25 June 2009. Summary of changes for version 20090625:

The ACPI 4.0 Specification was released on June 16 and is available at www.acpi.info. ACPICA implementation of ACPI 4.0 is underway and will continue for the next few releases.

1) ACPI CA Core Subsystem:

ACPI 4.0: Implemented interpreter support for the IPMI operation region address space. Includes support for bi-directional data buffers and an IPMI address space handler (to be installed by an IPMI device driver.) ACPICA BZ 773. Lin Ming.

ACPI 4.0: Added changes for existing ACPI tables - FACS and SRAT. Includes support in both the header files and the disassembler.

Completed a major update for the AcpiGetObjectInfo external interface. Changes include:

- Support for variable, unlimited length HID, UID, and CID strings.
- Support Processor objects the same as Devices (HID,UID,CID,ADR,STA, etc.)
- Call the _SxW power methods on behalf of a device object.
- Determine if a device is a PCI root bridge.
- Change the ACPI_BUFFER parameter to ACPI_DEVICE_INFO.

These changes will require an update to all callers of this interface. See the updated ACPICA Programmer Reference for details. One new source file has been added - utilities/utids.c. ACPICA BZ 368, 780.

Updated the AcpiRead and AcpiWrite external interfaces to support 64-bit transfers. The Value parameter has been extended from 32 bits to 64 bits in order to support new ACPI 4.0 tables. These changes will require an update to

order to support new ACPI 4.0 tables. These changes will require an update to all callers of these interfaces. See the ACPICA Programmer Reference for details. ACPICA BZ 768.

Fixed several problems with AcpiAttachData. The handler was not invoked when the host node was deleted. The data sub-object was not automatically deleted when the host node was deleted. The interface to the handler had an unused parameter, this was removed. ACPICA BZ 778.

Enhanced the function that dumps ACPI table headers. All non-printable characters in the string fields are now replaced with '?' (Signature, OemId, OemTableId, and CompilerId.) ACPI tables with non-printable characters in these fields are occasionally seen in the field. ACPICA BZ 788.

Fixed a problem with predefined method repair code where the code that attempts to repair/convert an object of incorrect type is only executed on the first time the predefined method is called. The mechanism that disables warnings on subsequent calls was interfering with the repair mechanism. ACPICA BZ 781.

Fixed a possible memory leak in the predefined validation/repair code when a buffer is automatically converted to an expected string object.

Removed obsolete 16-bit files from the distribution and from the current git tree head. ACPICA BZ 776.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  83.4K Code, 17.5K Data, 100.9K Total
    Debug Version:     158.9K Code, 50.0K Data, 208.9K Total
  Current Release:
    Non-Debug Version:  84.7K Code, 17.8K Data, 102.5K Total
    Debug Version:     160.5K Code, 50.6K Data, 211.1K Total
```

2) iASL Compiler/Disassembler and Tools:

ACPI 4.0: iASL and Disassembler - implemented support for the new IPMI operation region keyword. ACPICA BZ 771, 772. Lin Ming.

ACPI 4.0: iASL - implemented compile-time validation support for all new predefined names and control methods (31 total). ACPICA BZ 769.

---

21 May 2009. Summary of changes for version 20090521:

1) ACPI CA Core Subsystem:

Disabled the preservation of the SCI enable bit in the PM1 control register. The SCI enable bit (bit 0, SCI_EN) is defined by the ACPI specification to be a "preserved" bit - "OSPM always preserves this bit position", section 4.7.3.2.1. However, some machines fail if this bit is in fact preserved because the bit needs to be explicitly set by the OS as a workaround. No machines fail if the bit is not preserved. Therefore, ACPICA no longer attempts to preserve this bit.

Fixed a problem in AcpiRsGetPciRoutingTableLength where an invalid or incorrectly formed _PRT package could cause a fault. Added validation to ensure that each package element is actually a sub-package.

Implemented a new interface to install or override a single control method, AcpiInstallMethod. This interface is useful when debugging in order to repair an existing method or to install a missing method without having to override the entire ACPI table. See the ACPICA Programmer Reference for use and examples. Lin Ming, Bob Moore.

Fixed several reference count issues with the DdbHandle object that is created from a Load or LoadTable operator. Prevent premature deletion of the object. Also, mark the object as invalid once the table has been unloaded. This is needed because the handle itself may not be deleted after the table unload, depending on whether it has been stored in a named object by the caller. Lin Ming.

Fixed a problem with Mutex Sync Levels. Fixed a problem where if multiple mutexes of the same sync level are acquired but then not released in strict opposite order, the internally maintained Current Sync Level becomes confused and can cause subsequent execution errors. ACPICA BZ 471.

Changed the allowable release order for ASL mutex objects. The ACPI 4.0 specification has been changed to make the SyncLevel for mutex objects more useful. When releasing a mutex, the SyncLevel of the mutex must now be the same as the current sync level. This makes more sense than the previous rule (SyncLevel less than or equal). This change updates the code to match the

specification.

Fixed a problem with the local version of the AcpiOsPurgeCache function. The
Fixed a problem with the local version of the AcpiOsPurgeCache function. The
(local) cache must be locked during all cache object deletions. Andrew
Baumann.

Updated the Load operator to use operation region interfaces. This replaces
direct memory mapping with region access calls. Now, all region accesses go
Updated the Load operator to use operation region interfaces. This replaces
direct memory mapping with region access calls. Now, all region accesses go
through the installed region handler as they should.

Simplified and optimized the NsGetNextNode function. Reduced parameter count
Simplified and optimized the NsGetNextNode function. Reduced parameter count
and reduced code for this frequently used function.

BZ 13036. Lin Ming

Enhanced the execution of the ASL/AML BreakPoint operator so that it actually
Enhanced the execution of the ASL/AML BreakPoint operator so that it actually

breaks into the AML debugger if the debugger is present. This matches the
ACPI-defined behavior.

Fixed several possible warnings related to the use of the configurable
ACPI_THREAD_ID. This type can now be configured as either an integer or a
pointer with no warnings. Also fixes several warnings in printf-like
statements for the 64-bit build when the type is configured as a pointer.
ACPICA BZ 766, 767.

Fixed a number of possible warnings when compiling with gcc 4+ (depending on
warning options.) Examples include printf formats, aliasing, unused globals,
Fixed a number of possible warnings when compiling with gcc 4+ (depending on
warning options.) Examples include printf formats, aliasing, unused globals,
missing prototypes, missing switch default statements, use of non-ANSI
library functions, use of non-ANSI constructs. See generate/unix/Makefile for
library functions, use of non-ANSI constructs. See generate/unix/Makefile for
a list of warning options used with gcc 3 and 4. ACPICA BZ 735.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a

```

2) iASL Compiler/Disassembler and Tools:

iASL: Fixed a generation warning from Bison 2.3 and fixed several warnings on
iASL: Fixed a generation warning from Bison 2.3 and fixed several warnings on
the 64-bit build.

iASL: Fixed a problem where the Unix/Linux versions of the compiler could not
iASL: Fixed a problem where the Unix/Linux versions of the compiler could not
correctly digest Windows/DOS formatted files (with CR/LF).

iASL: Added a new option for "quiet mode" (-va) that produces only the
compilation summary, not individual errors and warnings. Useful for large
batch compilations.

AcpiExec: Implemented a new option (-z) to enable a forced semaphore/mutex
timeout that can be used to detect hang conditions during execution of AML
code (includes both internal semaphores and AML-defined mutexes and events.)
AcpiExec: Implemented a new option (-z) to enable a forced semaphore/mutex
timeout that can be used to detect hang conditions during execution of AML
code (includes both internal semaphores and AML-defined mutexes and events.)

Added new makefiles for the generation of acpica in a generic unix-like
environment. These makefiles are intended to generate the acpica tools and
environment. These makefiles are intended to generate the acpica tools and

utilities from the original acpica git source tree structure.

Test Suites: Updated and cleaned up the documentation files. Updated the copyrights to 2009, affecting all source files. Use the new version of iASL with quiet mode. Increased the number of available semaphores in the Windows OSL, allowing the aslts to execute fully on Windows. For the Unix OSL, added an alternate implementation of the semaphore timeout to allow aslts to execute fully on Cygwin.

---

20 March 2009. Summary of changes for version 20090320:

1) ACPI CA Core Subsystem:

Fixed a possible race condition between AcpiWalkNamespace and dynamic table unloads. Added a reader/writer locking mechanism to allow multiple concurrent namespace walks (readers), but block a dynamic table unload until it can gain exclusive write access to the namespace. This fixes a problem where a table unload could (possibly catastrophically) delete the portion of the namespace that is currently being examined by a walk. Adds a new file, utlock.c, that implements the reader/writer lock mechanism. ACPICA BZ 749.

Fixed a regression introduced in version 20090220 where a change to the FADT handling could cause the ACPICA subsystem to access non-existent I/O ports.

Modified the handling of FADT register and table (FACS/DSDT) addresses. The FADT can contain both 32-bit and 64-bit versions of these addresses. Previously, the 64-bit versions were favored, meaning that if both 32 and 64 versions were valid, but not equal, the 64-bit version was used. This was found to cause some machines to fail. Now, in this case, the 32-bit version is used instead. This now matches the Windows behavior.

Implemented a new mechanism to protect certain I/O ports. Provides Microsoft compatibility and protects the standard PC I/O ports from access via AML code. Adds a new file, hwvalid.c

Fixed a possible extraneous warning message from the FADT support. The message warns of a 32/64 length mismatch between the legacy and GAS definitions for a register.

Removed the obsolete AcpiOsValidateAddress OSL interface. This interface is made obsolete by the port protection mechanism above. It was previously used to validate the entire address range of an operation region, which could be incorrect if the range included illegal ports, but fields within the operation region did not actually access those ports. Validation is now performed on a per-field basis instead of the entire region.

Modified the handling of the PM1 Status Register ignored bit (bit 11.) Ignored bits must be "preserved" according to the ACPI spec. Usually, this means a read/modify/write when writing to the register. However, for status registers, writing a one means clear the event. Writing a zero means preserve the event (do not clear.) This behavior is clarified in the ACPI 4.0 spec, and the ACPICA code now simply always writes a zero to the ignored bit.

Modified the handling of ignored bits for the PM1 A/B Control Registers. As per the ACPI specification, for the control registers, preserve (read/modify/write) all bits that are defined as either reserved or ignored.

Updated the handling of write-only bits in the PM1 A/B Control Registers. When reading the register, zero the write-only bits as per the ACPI spec. ACPICA BZ 443. Lin Ming.

Removed "Linux" from the list of supported _OSI strings. Linux no longer wants to reply true to this request. The Windows strings are the only paths through the AML that are tested and known to work properly.

```
  Previous Release:
    Non-Debug Version:  82.0K Code, 17.5K Data,  99.5K Total
    Debug Version:     156.9K Code, 49.8K Data, 206.7K Total

```

2) iASL Compiler/Disassembler and Tools:

Acpiexec: Split the large aeexec.c file into two new files, aehandlers.c and aetables.c

---

20 February 2009. Summary of changes for version 20090220:

1) ACPI CA Core Subsystem:

Optimized the ACPI register locking. Removed locking for reads from the ACPI bit registers in PM1 Status, Enable, Control, and PM2 Control. The lock is
Optimized the ACPI register locking. Removed locking for reads from the ACPI bit registers in PM1 Status, Enable, Control, and PM2 Control. The lock is
not required when reading the single-bit registers. The **AcpiGetRegisterUnlocked function is no longer needed and has been removed. This will improve performance for reads on these registers. ACPICA BZ 760.**
AcpiGetRegisterUnlocked function is no longer needed and has been removed. This will improve performance for reads on these registers. ACPICA BZ 760.

Fixed the parameter validation for AcpiRead/Write. Now return **AE_BAD_PARAMETER if the input register pointer is null, and AE_BAD_ADDRESS if the register has an address of zero. Previously, these cases simply returned AE_OK. For optional registers such as PM1B status/enable/control, the caller**
AE_BAD_PARAMETER if the input register pointer is null, and AE_BAD_ADDRESS if the register has an address of zero. Previously, these cases simply returned AE_OK. For optional registers such as PM1B status/enable/control, the caller
should check for a valid register address before calling. ACPICA BZ 748.

Renamed the external ACPI bit register access functions. Renamed AcpiGetRegister and AcpiSetRegister to clarify the purpose of these **functions. The new names are AcpiReadBitRegister and AcpiWriteBitRegister. Also, restructured the code for these functions by simplifying the code path**
functions. The new names are AcpiReadBitRegister and AcpiWriteBitRegister. Also, restructured the code for these functions by simplifying the code path
and condensing duplicate code to reduce code size.

Added new functions to transparently handle the possibly split PM1 A/B **registers. AcpiHwReadMultiple and AcpiHwWriteMultiple. These two functions now handle the split registers for PM1 Status, Enable, and Control. ACPICA BZ**
registers. AcpiHwReadMultiple and AcpiHwWriteMultiple. These two functions now handle the split registers for PM1 Status, Enable, and Control. ACPICA BZ
746.

Added a function to handle the PM1 control registers, AcpiHwWritePm1Control. This function writes both of the PM1 control registers (A/B). These registers are different than the PM1 A/B status and enable registers in that different values can be written to the A/B registers. Most notably, the SLP_TYP bits can be different, as per the values returned from the _Sx predefined methods.
Added a function to handle the PM1 control registers, AcpiHwWritePm1Control. This function writes both of the PM1 control registers (A/B). These registers are different than the PM1 A/B status and enable registers in that different values can be written to the A/B registers. Most notably, the SLP_TYP bits can be different, as per the values returned from the _Sx predefined methods.

Removed an extra register write within AcpiHwClearAcpiStatus. This function was writing an optional PM1B status register twice. The existing call to the low-level AcpiHwRegisterWrite automatically handles a possibly split PM1 A/B
Removed an extra register write within AcpiHwClearAcpiStatus. This function was writing an optional PM1B status register twice. The existing call to the low-level AcpiHwRegisterWrite automatically handles a possibly split PM1 A/B
register. ACPICA BZ 751.

Split out the PM1 Status registers from the FADT. Added new globals for these
Split out the PM1 Status registers from the FADT. Added new globals for these
registers (A/B), similar to the way the PM1 Enable registers are handled. **Instead of overloading the FADT Event Register blocks. This makes the code**
Instead of overloading the FADT Event Register blocks. This makes the code
clearer and less prone to error.

Fixed the warning message for when the platform contains too many ACPI tables for the default size of the global root table data structure. The calculation
Fixed the warning message for when the platform contains too many ACPI tables for the default size of the global root table data structure. The calculation
for the truncation value was incorrect.

Removed the ACPI_GET_OBJECT_TYPE macro. Removed all instances of this **obsolete macro, since it is now a simple reference to ->common.type. There**
obsolete macro, since it is now a simple reference to ->common.type. There
were about 150 invocations of the macro across 41 files. ACPICA BZ 755.

Removed the redundant ACPI_BITREG_SLEEP_TYPE_B. This type is the same as TYPE_A. Removed this and all related instances. Renamed SLEEP_TYPE_A to simply SLEEP_TYPE. ACPICA BZ 754.

Conditionally compile the AcpiSetFirmwareWakingVector64 function. This function is only needed on 64-bit host operating systems and is thus not included for 32-bit hosts.

Debug output: print the input and result for invocations of the _OSI reserved control method via the ACPI_LV_INFO debug level. Also, reduced some of the

2) iASL Compiler/Disassembler and Tools:

Disassembler: Decode the FADT PM_Profile field. Emit ascii names for the
various legal performance profiles.

---

23 January 2009. Summary of changes for version 20090123:

1) ACPI CA Core Subsystem:

Added the 2009 copyright to all module headers and signons. This affects
virtually every file in the ACPICA core subsystem, the iASL compiler, and
the tools/utilities.

**Implemented a change to allow the host to override any ACPI table, including
dynamically loaded tables. Previously, only the DSDT could be replaced by the
host. With this change, the AcpiOsTableOverride interface is called for each
table found in the RSDT/XSDT during ACPICA initialization, and also whenever**
*Implemented a change to allow the host to override any ACPI table, including
dynamically loaded tables. Previously, only the DSDT could be replaced by the
host. With this change, the AcpiOsTableOverride interface is called for each
table found in the RSDT/XSDT during ACPICA initialization, and also whenever*
a table is dynamically loaded via the AML Load operator.

Updated FADT flag definitions, especially the Boot Architecture flags.

**Debugger: For the Find command, automatically pad the input ACPI name with
underscores if the name is shorter than 4 characters. This enables a match**
*Debugger: For the Find command, automatically pad the input ACPI name with
underscores if the name is shorter than 4 characters. This enables a match*
with the actual namespace entry which is itself padded with underscores.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

04 December 2008. Summary of changes for version 20081204:

1) ACPI CA Core Subsystem:

The ACPICA Programmer Reference has been completely updated and revamped for
The ACPICA Programmer Reference has been completely updated and revamped for
this release. This includes updates to the external interfaces, OSL
interfaces, the overview sections, and the debugger reference.

Several new ACPICA interfaces have been implemented and documented in the
programmer reference:
AcpiReset - Writes the reset value to the FADT-defined reset register.
AcpiDisableAllGpes - Disable all available GPEs.
AcpiEnableAllRuntimeGpes - Enable all available runtime GPEs.
AcpiGetGpeDevice - Get the GPE block device associated with a GPE.
AcpiGbl_CurrentGpeCount - Tracks the current number of available GPEs.
AcpiRead - Low-level read ACPI register (was HwLowLevelRead.)
AcpiWrite - Low-level write ACPI register (was HwLowLevelWrite.)

Most of the public ACPI hardware-related interfaces have been moved to a new
Most of the public ACPI hardware-related interfaces have been moved to a new
file, components/hardware/hwxface.c

Enhanced the FADT parsing and low-level ACPI register access: The ACPI
register lengths within the FADT are now used, and the low level ACPI
register access no longer hardcodes the ACPI register lengths. Given that
**there may be some risk in actually trusting the FADT register lengths, a run-
time option was added to fall back to the default hardcoded lengths if the**
*there may be some risk in actually trusting the FADT register lengths, a run-
time option was added to fall back to the default hardcoded lengths if the*
FADT proves to contain incorrect values - UseDefaultRegisterWidths. This
option is set to true for now, and a warning is issued if a suspicious FADT
option is set to true for now, and a warning is issued if a suspicious FADT
register length is overridden with the default value.

Fixed a reference count issue in NsRepairObject. This problem was introduced
Fixed a reference count issue in NsRepairObject. This problem was introduced
in version 20081031 as part of a fix to repair Buffer objects within
Packages. Lin Ming.

Added semaphore support to the Linux/Unix application OS-services layer
(OSL). ACPICA BZ 448. Lin Ming.

Added the ACPI_MUTEX_TYPE configuration option to select whether mutexes will
Added the ACPI_MUTEX_TYPE configuration option to select whether mutexes will
be implemented in the OSL, or will binary semaphores be used instead.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

```

2) iASL Compiler/Disassembler and Tools:

iASL: Completed the '-e' option to include additional ACPI tables in order to aid with disassembly and External statement generation. ACPICA BZ 742. Lin
iASL: Completed the '-e' option to include additional ACPI tables in order to aid with disassembly and External statement generation. ACPICA BZ 742. Lin Ming.

iASL: Removed the "named object in while loop" error. The compiler cannot determine how many times a loop will execute. ACPICA BZ 730.

Disassembler: Implemented support for FADT revision 2 (MS extension). ACPICA
Disassembler: Implemented support for FADT revision 2 (MS extension). ACPICA BZ 743.

Disassembler: Updates for several ACPI data tables (HEST, EINJ, and MCFG).
Disassembler: Updates for several ACPI data tables (HEST, EINJ, and MCFG).

---
31 October 2008. Summary of changes for version 20081031:

1) ACPI CA Core Subsystem:

Restructured the ACPICA header files into public/private. acpi.h now includes only the "public" acpica headers. All other acpica headers are "private" and should not be included by acpica users. One new file, accommon.h is used to include the commonly used private headers for acpica code generation. Future
Restructured the ACPICA header files into public/private. acpi.h now includes only the "public" acpica headers. All other acpica headers are "private" and should not be included by acpica users. One new file, accommon.h is used to include the commonly used private headers for acpica code generation. Future plans include moving all private headers to a new subdirectory.

Implemented an automatic Buffer->String return value conversion for **predefined ACPI methods. For these methods (such as _BIF), added automatic conversion for return objects that are required to be a String, but a Buffer was found instead. This can happen when reading string battery data from an operation region, because it used to be difficult to convert the data from buffer to string from within the ASL. Ensures that the host OS is provided**
predefined ACPI methods. For these methods (such as _BIF), added automatic conversion for return objects that are required to be a String, but a Buffer was found instead. This can happen when reading string battery data from an operation region, because it used to be difficult to convert the data from buffer to string from within the ASL. Ensures that the host OS is provided with a valid null-terminated string. Linux BZ 11822.

Updated the FACS waking vector interfaces. Split AcpiSetFirmwareWakingVector into two: one for the 32-bit vector, another for the 64-bit vector. This is

required because the host OS must setup the wake much differently for each vector (real vs. protected mode, etc.) and the interface itself should not be deciding which vector to use. Also, eliminated the GetFirmwareWakingVector interface, as it served no purpose (only the firmware reads the vector, OS
Updated the FACS waking vector interfaces. Split AcpiSetFirmwareWakingVector into two: one for the 32-bit vector, another for the 64-bit vector. This is required because the host OS must setup the wake much differently for each vector (real vs. protected mode, etc.) and the interface itself should not be deciding which vector to use. Also, eliminated the GetFirmwareWakingVector interface, as it served no purpose (only the firmware reads the vector, OS only writes the vector.) ACPICA BZ 731.

Implemented a mechanism to escape infinite AML While() loops. Added a loop counter to force exit from AML While loops if the count becomes too large.
Implemented a mechanism to escape infinite AML While() loops. Added a loop counter to force exit from AML While loops if the count becomes too large. This can occur in poorly written AML when the hardware does not respond **within a while loop and the loop does not implement a timeout. The maximum loop count is configurable. A new exception code is returned when a loop is**
within a while loop and the loop does not implement a timeout. The maximum loop count is configurable. A new exception code is returned when a loop is broken, AE_AML_INFINITE_LOOP. Alexey Starikovskiy, Bob Moore.

Optimized the execution of AML While loops. Previously, a control state object was allocated and freed for each execution of the loop. The **optimization is to simply reuse the control state for each iteration. This**
optimization is to simply reuse the control state for each iteration. This speeds up the raw loop execution time by about 5%.

Enhanced the implicit return mechanism. For Windows compatibility, return an implicit integer of value zero for methods that contain no executable code.
Enhanced the implicit return mechanism. For Windows compatibility, return an implicit integer of value zero for methods that contain no executable code. Such methods are seen in the field as stubs (presumably), and can cause drivers to fail if they expect a return value. Lin Ming.

Allow multiple backslashes as root prefixes in namepaths. In a fully **qualified namepath, allow multiple backslash prefixes. This can happen (and is seen in the field) because of the use of a double-backslash in strings (since backslash is the escape character) causing confusion. ACPICA BZ 739**
qualified namepath, allow multiple backslash prefixes. This can happen (and is seen in the field) because of the use of a double-backslash in strings *(since backslash is the escape character) causing confusion. ACPICA BZ 739* Lin Ming.

Emit a warning if two different FACS or DSDT tables are discovered in the **FADT. Checks if there are two valid but different addresses for the FACS and**
FADT. Checks if there are two valid but different addresses for the FACS and DSDT within the FADT (mismatch between the 32-bit and 64-bit fields.)

Consolidated the method argument count validation code. Merged the code that

Consolidated the method argument count validation code. Merged the code that validates control method argument counts into the predefined validation module. Eliminates possible multiple warnings for incorrect argument counts.

Implemented ACPICA example code. Includes code for ACPICA initialization, handler installation, and calling a control method. Available at source/tools/examples.

Added a global pointer for FACS table to simplify internal FACS access. Use the global pointer instead of using AcpiGetTableByIndex for each FACS access. This simplifies the code for the Global Lock and the Firmware Waking Vector(s).

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size.

  Previous Release:
    Non-Debug Version: 81.2K Code, 17.0K Data, 98.2K Total
    Debug Version: 155.8K Code, 49.1K Data, 204.9K Total
  Current Release:
    Non-Debug Version: 81.7K Code, 17.3K Data, 99.0K Total
    Debug Version: 156.4K Code, 49.4K Data, 205.8K Total

2) iASL Compiler/Disassembler and Tools:

iASL: Improved disassembly of external method calls. Added the -e option to allow the inclusion of additional ACPI tables to help with the disassembly of method invocations and the generation of external declarations during the disassembly. Certain external method invocations cannot be disassembled properly without the actual declaration of the method. Use the -e option to include the table where the external method(s) are actually declared. Most useful for disassembling SSDTs that make method calls back to the master DSDT. Lin Ming. Example: To disassemble an SSDT with calls to DSDT: iasl -d -e dsdt.aml ssdt1.aml

iASL: Fix to allow references to aliases within ASL namepaths. Fixes a problem where the use of an alias within a namepath would result in a not found error or cause the compiler to fault. Also now allows forward references from the Alias operator itself. ACPICA BZ 738.

---

26 September 2008. Summary of changes for version 20080926:

1) ACPI CA Core Subsystem:

Designed and implemented a mechanism to validate predefined ACPI methods and objects. This code validates the predefined ACPI objects (objects whose names start with underscore) that appear in the namespace, at the time they are evaluated. The argument count and the type of the returned object are validated against the ACPI specification. The purpose of this validation is to detect problems with the BIOS-implemented predefined ACPI objects before the results are returned to the ACPI-related drivers. Future enhancements may include actual repair of incorrect return objects where possible. Two new files are nspredef.c and acpredef.h.

Fixed a fault in the AML parser if a memory allocation fails during the Op completion routine AcpiPsCompleteThisOp. Lin Ming. ACPICA BZ 492.

Fixed an issue with implicit return compatibility. This change improves the implicit return mechanism to be more compatible with the MS interpreter. Lin Ming, ACPICA BZ 349.

Implemented support for zero-length buffer-to-string conversions. Allow zero length strings during interpreter buffer-to-string conversions. For example, during the ToDecimalString and ToHexString operators, as well as implicit conversions. Fiodor Suietov, ACPICA BZ 585.

Fixed two possible memory leaks in the error exit paths of AcpiUtUpdateObjectReference and AcpiUtWalkPackageTree. These functions are similar in that they use a stack of state objects in order to eliminate recursion. The stack must be fully unwound and deallocated if an error occurs. Lin Ming. ACPICA BZ 383.

Removed the unused ACPI_BITREG_WAKE_ENABLE definition and entry in the global ACPI register table. This bit does not exist and is unused. Lin Ming, Bob Moore ACPICA BZ 442.

Removed the obsolete version number in module headers. Removed the "$Revision" number that appeared in each module header. This version number was useful under SourceSafe and CVS, but has no meaning under git. It is not only incorrect, it could also be misleading.

Example Code and Data Size: These are the sizes for the OS-independent

acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  79.7K Code, 16.4K Data,  96.1K Total
    Debug Version:     153.7K Code, 48.2K Data, 201.9K Total
  Current Release:
    Non-Debug Version:  81.2K Code, 17.0K Data,  98.2K Total
    Debug Version:     155.8K Code, 49.1K Data, 204.9K Total
```

---

29 August 2008. Summary of changes for version 20080829:

1) ACPI CA Core Subsystem:

Completed a major cleanup of the internal ACPI_OPERAND_OBJECT of type
Reference. Changes include the elimination of cheating on the Object field
Reference. Changes include the elimination of cheating on the Object field
for the DdbHandle subtype, addition of a reference class field to
differentiate the various reference types (instead of an AML opcode), and the
differentiate the various reference types (instead of an AML opcode), and the
cleanup of debug output for this object. Lin Ming, Bob Moore. BZ 723

Reduce an error to a warning for an incorrect method argument count.
Previously aborted with an error if too few arguments were passed to a
control method via the external ACPICA interface. Now issue a warning instead and continue. Handles the case where the method inadvertently declares too many arguments, but does not actually use the extra ones. Applies mainly to
control method via the external ACPICA interface. Now issue a warning instead and continue. Handles the case where the method inadvertently declares too many arguments, but does not actually use the extra ones. Applies mainly to
the predefined methods. Lin Ming. Linux BZ 11032.

Disallow the evaluation of named object types with no intrinsic value. Return AE_TYPE for objects that have no value and therefore evaluation is undefined: Device, Event, Mutex, Region, Thermal, and Scope. Previously, evaluation of these types were allowed, but an exception would be generated at some point
Disallow the evaluation of named object types with no intrinsic value. Return AE_TYPE for objects that have no value and therefore evaluation is undefined: Device, Event, Mutex, Region, Thermal, and Scope. Previously, evaluation of these types were allowed, but an exception would be generated at some point
during the evaluation. Now, the error is generated up front.

Fixed a possible memory leak in the AcpiNsGetExternalPathname function
(nsnames.c). Fixes a leak in the error exit path.

Removed the obsolete debug levels ACPI_DB_WARN and ACPI_DB_ERROR. These debug levels were made obsolete by the ACPI_WARNING, ACPI_ERROR, and ACPI_EXCEPTION
Removed the obsolete debug levels ACPI_DB_WARN and ACPI_DB_ERROR. These debug levels were made obsolete by the ACPI_WARNING, ACPI_ERROR, and ACPI_EXCEPTION
interfaces. Also added ACPI_DB_EVENTS to correspond with the existing
ACPI_LV_EVENTS.

Removed obsolete and/or unused exception codes from the acexcep.h header.
There is the possibility that certain device drivers may be affected if they
There is the possibility that certain device drivers may be affected if they
use any of these exceptions.

The ACPICA documentation has been added to the public git source tree, under
The ACPICA documentation has been added to the public git source tree, under
acpica/documents. Included are the ACPICA programmer reference, the iASL
compiler reference, and the changes.txt release logfile.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

    Debug Version:     153.7K Code, 48.2K Data, 201.9K Total
```

2) iASL Compiler/Disassembler and Tools:

Allow multiple argument counts for the predefined _SCP method. ACPI 3.0
defines _SCP with 3 arguments. Previous versions defined it with only 1
argument. iASL now allows both definitions.

iASL/disassembler: avoid infinite loop on bad ACPI tables. Check for zero-length subtables when disassembling ACPI tables. Also fixed a couple of errors where a full 16-bit table type field was not extracted from the input
iASL/disassembler: avoid infinite loop on bad ACPI tables. Check for zero-length subtables when disassembling ACPI tables. Also fixed a couple of errors where a full 16-bit table type field was not extracted from the input
properly.

acpisrc: Improve comment counting mechanism for generating source code
statistics. Count first and last lines of multi-line comments as whitespace, not comment lines. Handle Linux legal header in addition to standard acpica
statistics. Count first and last lines of multi-line comments as whitespace, not comment lines. Handle Linux legal header in addition to standard acpica
header.

---

29 July 2008. Summary of changes for version 20080729:

1) ACPI CA Core Subsystem:

Fix a possible deadlock in the GPE dispatch. Remove call to
AcpiHwDisableAllGpes during wake in AcpiEvGpeDispatch. This call will attempt to acquire the GPE lock but can deadlock since the GPE lock is already held at dispatch time. This code was introduced in version 20060831 as a response
AcpiHwDisableAllGpes during wake in AcpiEvGpeDispatch. This call will attempt to acquire the GPE lock but can deadlock since the GPE lock is already held

at dispatch time. This code was introduced in version 20060831 as a response
to Linux BZ 6881 and has since been removed from Linux.

Add a function to dereference returned reference objects. Examines the return
object from a call to AcpiEvaluateObject. Any Index or RefOf references are
automatically dereferenced in an attempt to return something useful (these
reference types cannot be converted into an external ACPI_OBJECT.) Provides
Add a function to dereference returned reference objects. Examines the return
object from a call to AcpiEvaluateObject. Any Index or RefOf references are
automatically dereferenced in an attempt to return something useful (these
reference types cannot be converted into an external ACPI_OBJECT.) Provides
MS compatibility. Lin Ming, Bob Moore. Linux BZ 11105

x2APIC support: changes for MADT and SRAT ACPI tables. There are 2 new
subtables for the MADT and one new subtable for the SRAT. Includes
disassembler and AcpiSrc support. Data from the Intel 64 Architecture x2APIC
disassembler and AcpiSrc support. Data from the Intel 64 Architecture x2APIC
Specification, June 2008.

Additional error checking for pathname utilities. Add error check after all
Additional error checking for pathname utilities. Add error check after all
calls to AcpiNsGetPathnameLength. Add status return from
AcpiNsBuildExternalPath and check after all calls. Add parameter validation
AcpiNsBuildExternalPath and check after all calls. Add parameter validation
to AcpiUtInitializeBuffer. Reported by and initial patch by Ingo Molnar.

Return status from the global init function AcpiUtGlobalInitialize. This is
used by both the kernel subsystem and the utilities such as iASL compiler.
The function could possibly fail when the caches are initialized. Yang Yi.
Return status from the global init function AcpiUtGlobalInitialize. This is
used by both the kernel subsystem and the utilities such as iASL compiler.
The function could possibly fail when the caches are initialized. Yang Yi.

Add a function to decode reference object types to strings. Created for
improved error messages.

Improve object conversion error messages. Better error messages during object
conversion from internal to the external ACPI_OBJECT. Used for external calls

2) iASL Compiler/Disassembler and Tools:

Debugger: fix a possible hang when evaluating non-methods. Fixes a problem
introduced in version 20080701. If the object being evaluated (via execute
command) is not a method, the debugger can hang while trying to obtain non-
Debugger: fix a possible hang when evaluating non-methods. Fixes a problem
introduced in version 20080701. If the object being evaluated (via execute
command) is not a method, the debugger can hang while trying to obtain non-
existent parameters.

iASL: relax error for using reserved "_T_x" identifiers. These names can
appear in a disassembled ASL file if they were emitted by the original
compiler. Instead of issuing an error or warning and forcing the user to
manually change these names, issue a remark instead.

iASL: error if named object created in while loop. Emit an error if any named
object is created within a While loop. If allowed, this code will generate a
run-time error on the second iteration of the loop when an attempt is made to
iASL: error if named object created in while loop. Emit an error if any named
object is created within a While loop. If allowed, this code will generate a
run-time error on the second iteration of the loop when an attempt is made to
create the same named object twice. ACPICA bugzilla 730.

iASL: Support absolute pathnames for include files. Add support for absolute
pathnames within the Include operator. previously, only relative pathnames
iASL: Support absolute pathnames for include files. Add support for absolute
pathnames within the Include operator. previously, only relative pathnames
were supported.

iASL: Enforce minimum 1 interrupt in interrupt macro and Resource Descriptor.
iASL: Enforce minimum 1 interrupt in interrupt macro and Resource Descriptor.
The ACPI spec requires one interrupt minimum. BZ 423

iASL: Handle a missing ResourceSource arg, with a present SourceIndex.
Handles the case for the Interrupt Resource Descriptor where
the ResourceSource argument is omitted but ResourceSourceIndex
is present. Now leave room for the Index. BZ 426

iASL: Prevent error message if CondRefOf target does not exist. Fixes cases
iASL: Prevent error message if CondRefOf target does not exist. Fixes cases
where an error message is emitted if the target does not exist. BZ 516

iASL: Fix broken -g option (get Windows ACPI tables). Fixes the -g option
(get ACPI tables on Windows). This was apparently broken in version 20070919.
(get ACPI tables on Windows). This was apparently broken in version 20070919.

AcpiXtract: Handle EOF while extracting data. Correctly handle the case where
AcpiXtract: Handle EOF while extracting data. Correctly handle the case where
the EOF happens immediately after the last table in the input file. Print
completion message. Previously, no message was displayed in this case.

```
5219 ----------------------------------------
5220 01 July 2008. Summary of changes for version 20080701:

5222 0) Git source tree / acpica.org

5224 Fixed a problem where a git-clone from http would not transfer the entire
5225 source tree.

5227 1) ACPI CA Core Subsystem:

5229 Implemented a "careful" GPE disable in AcpiEvDisableGpe, only modify one
5230 enable bit. Now performs a read-change-write of the enable register
5231 instead
5232 of simply writing out the cached enable mask. This will prevent
5233 inadvertent
5234 enabling of GPEs if a rogue GPE is received during initialization (before
5235 GPE
2145 enable bit. Now performs a read-change-write of the enable register instead
2146 of simply writing out the cached enable mask. This will prevent inadvertent
2147 enabling of GPEs if a rogue GPE is received during initialization (before GPE
5236 handlers are installed.)

5238 Implemented a copy for dynamically loaded tables. Previously, dynamically
5239 loaded tables were simply mapped - but on some machines this memory is
5240 corrupted after suspend. Now copy the table to a local buffer. For the
5241 OpRegion case, added checksum verify. Use the table length from the table
5242 header, not the region length. For the Buffer case, use the table length
5243 also. Dennis Noordsij, Bob Moore. BZ 10734

5245 Fixed a problem where the same ACPI table could not be dynamically loaded
5246 and
5247 unloaded more than once. Without this change, a table cannot be loaded
5248 again
2157 Fixed a problem where the same ACPI table could not be dynamically loaded and
2158 unloaded more than once. Without this change, a table cannot be loaded again
5249 once it has been loaded/unloaded one time. The current mechanism does not
5250 unregister a table upon an unload. During a load, if the same table is
5251 found,
2160 unregister a table upon an unload. During a load, if the same table is found,
5252 this no longer returns an exception. BZ 722

5254 Fixed a problem where the wrong descriptor length was calculated for the
5255 EndTag descriptor in 64-bit mode. The "minimal" descriptors such as
5256 EndTag
2164 EndTag descriptor in 64-bit mode. The "minimal" descriptors such as EndTag
5257 are calculated as 12 bytes long, but the actual length in the internal
5258 descriptor is 16 because of the round-up to 8 on the 64-bit build.
5259 Reported
2166 descriptor is 16 because of the round-up to 8 on the 64-bit build. Reported
5260 by Linn Crosetto. BZ 728

5262 Fixed a possible memory leak in the Unload operator. The DdbHandle
5263 returned
5264 by Load() did not have its reference count decremented during unload,
5265 leading
2169 Fixed a possible memory leak in the Unload operator. The DdbHandle returned
2170 by Load() did not have its reference count decremented during unload, leading
5266 to a memory leak. Lin Ming. BZ 727

5268 Fixed a possible memory leak when deleting thermal/processor objects. Any
5269 associated notify handlers (and objects) were not being deleted. Fiodor
5270 Suietov. BZ 506

5272 Fixed the ordering of the ASCII names in the global mutex table to match
5273 the
```

```
5274 actual mutex IDs. Used by AcpiUtGetMutexName, a function used for debug
5275 only.
2177 Fixed the ordering of the ASCII names in the global mutex table to match the
2178 actual mutex IDs. Used by AcpiUtGetMutexName, a function used for debug only.
5276 Vegard Nossum. BZ 726

5278 Enhanced the AcpiGetObjectInfo interface to return the number of required
5279 arguments if the object is a control method. Added this call to the
5280 debugger
2182 arguments if the object is a control method. Added this call to the debugger
5281 so the proper number of default arguments are passed to a method. This
5282 prevents a warning when executing methods from AcpiExec.

5284 Added a check for an invalid handle in AcpiGetObjectInfo. Return
5285 AE_BAD_PARAMETER if input handle is invalid. BZ 474

5287 Fixed an extraneous warning from exconfig.c on the 64-bit build.

5289 Example Code and Data Size: These are the sizes for the OS-independent
5290 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
5291 debug version of the code includes the debug output trace mechanism and
5292 has a
2193 debug version of the code includes the debug output trace mechanism and has a
5293 much larger code and data size.

5295   Previous Release:
5296     Non-Debug Version:  79.3K Code, 16.2K Data,  95.5K Total
5297     Debug Version:     153.0K Code, 48.2K Data, 201.2K Total
5298   Current Release:
5299     Non-Debug Version:  79.6K Code, 16.2K Data,  95.8K Total
5300     Debug Version:     153.5K Code, 48.2K Data, 201.7K Total

5302 2) iASL Compiler/Disassembler and Tools:

5304 iASL: Added two missing ACPI reserved names. Added _MTP and _ASZ, both
5305 resource descriptor names.

5307 iASL: Detect invalid ASCII characters in input (windows version). Removed
5308 the
2208 iASL: Detect invalid ASCII characters in input (windows version). Removed the
5309 "-CF" flag from the flex compile, enables correct detection of non-ASCII
5310 characters in the input. BZ 441

5312 iASL: Eliminate warning when result of LoadTable is not used. Eliminate
5313 the
2212 iASL: Eliminate warning when result of LoadTable is not used. Eliminate the
5314 "result of operation not used" warning when the DDB handle returned from
5315 LoadTable is not used. The warning is not needed. BZ 590

5317 AcpiExec: Add support for dynamic table load/unload. Now calls _CFG
5318 method
5319 to
5320 pass address of table to the AML. Added option to disable OpRegion
5321 simulation
5322 to allow creation of an OpRegion with a real address that was passed to
5323 _CFG.
5324 All of this allows testing of the Load and Unload operators from
5325 AcpiExec.
2216 AcpiExec: Add support for dynamic table load/unload. Now calls _CFG method to
2217 pass address of table to the AML. Added option to disable OpRegion simulation
2218 to allow creation of an OpRegion with a real address that was passed to _CFG.
2219 All of this allows testing of the Load and Unload operators from AcpiExec.

5327 Debugger: update tables command for unloaded tables. Handle unloaded
5328 tables
2221 Debugger: update tables command for unloaded tables. Handle unloaded tables
```

and use the standard table header output routine.

---
09 June 2008. Summary of changes for version 20080609:

1) ACPI CA Core Subsystem:

Implemented a workaround for reversed _PRT entries. A significant number of
Implemented a workaround for reversed _PRT entries. A significant number of
BIOSs erroneously reverse the _PRT SourceName and the SourceIndex. This
change dynamically detects and repairs this problem. Provides compatibility
change dynamically detects and repairs this problem. Provides compatibility
with MS ACPI. BZ 6859

Simplified the internal ACPI hardware interfaces to eliminate the locking
flag parameter from Register Read/Write. Added a new external interface,
AcpiGetRegisterUnlocked.

Fixed a problem where the invocation of a GPE control method could hang. This
Fixed a problem where the invocation of a GPE control method could hang. This
was a regression introduced in 20080514. The new method argument count
validation mechanism can enter an infinite loop when a GPE method is
dispatched. Problem fixed by removing the obsolete code that passed GPE block
information to the notify handler via the control method parameter pointer.
dispatched. Problem fixed by removing the obsolete code that passed GPE block
information to the notify handler via the control method parameter pointer.

Fixed a problem where the _SST execution status was incorrectly returned to
Fixed a problem where the _SST execution status was incorrectly returned to
the caller of AcpiEnterSleepStatePrep. This was a regression introduced in
20080514. _SST is optional and a NOT_FOUND exception should never be
returned. BZ 716

Fixed a problem where a deleted object could be accessed from within the AML
Fixed a problem where a deleted object could be accessed from within the AML
parser. This was a regression introduced in version 20080123 as a fix for the
Unload operator. Lin Ming. BZ 10669

Cleaned up the debug operand dump mechanism. Eliminated unnecessary operands
Cleaned up the debug operand dump mechanism. Eliminated unnecessary operands
and eliminated the use of a negative index in a loop. Operands are now
displayed in the correct order, not backwards. This also fixes a regression
displayed in the correct order, not backwards. This also fixes a regression
introduced in 20080514 on 64-bit systems where the elimination of
ACPI_NATIVE_UINT caused the negative index to go large and positive. BZ 715
ACPI_NATIVE_UINT caused the negative index to go large and positive. BZ 715

Fixed a possible memory leak in EvPciConfigRegionSetup where the error exit
Fixed a possible memory leak in EvPciConfigRegionSetup where the error exit
path did not delete a locally allocated structure.

Updated definitions for the DMAR and SRAT tables to synchronize with the
current specifications. Includes disassembler support.

Fixed a problem in the mutex debug code (in utmutex.c) where an incorrect
loop termination value was used. Loop terminated on iteration early, missing
loop termination value was used. Loop terminated on iteration early, missing
one mutex. Linn Crosetto

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has a
debug version of the code includes the debug output trace mechanism and has a
much larger code and data size.

  Previous Release:
    Non-Debug Version: 79.5K Code, 16.2K Data, 95.7K Total
    Debug Version: 153.3K Code, 48.3K Data, 201.6K Total
  Current Release:

    Debug Version: 153.0K Code, 48.2K Data, 201.2K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: Implemented support for EisaId() within _CID objects. Now
disassemble integer _CID objects back to EisaId invocations, including
multiple integers within _CID packages. Includes single-step support for
debugger also.

Disassembler: Added support for DMAR and SRAT table definition changes.

---
14 May 2008. Summary of changes for version 20080514:

1) ACPI CA Core Subsystem:

Fixed a problem where GPEs were enabled too early during the ACPICA
initialization. This could lead to "handler not installed" errors on some
machines. Moved GPE enable until after _REG/_STA/_INI methods are run. This
machines. Moved GPE enable until after _REG/_STA/_INI methods are run. This
ensures that all operation regions and devices throughout the namespace have
ensures that all operation regions and devices throughout the namespace have
been initialized before GPEs are enabled. Alexey Starikovskiy, BZ 9916.

Implemented a change to the enter sleep code. Moved execution of the _GTS
method to just before setting sleep enable bit. The execution was moved from
method to just before setting sleep enable bit. The execution was moved from
AcpiEnterSleepStatePrep to AcpiEnterSleepState. _GTS is now executed
immediately before the SLP_EN bit is set, as per the ACPI specification.
Luming Yu, BZ 1653.

Implemented a fix to disable unknown GPEs (2nd version). Now always disable
Implemented a fix to disable unknown GPEs (2nd version). Now always disable
the GPE, even if ACPICA thinks that that it is already disabled. It is
possible that the AML or some other code has enabled the GPE unbeknownst to
possible that the AML or some other code has enabled the GPE unbeknownst to
the ACPICA code.

Fixed a problem with the Field operator where zero-length fields would return

an AE_AML_NO_OPERAND exception during table load. Fix enables zero-length ASL
Fixed a problem with the Field operator where zero-length fields would return an AE_AML_NO_OPERAND exception during table load. Fix enables zero-length ASL field declarations in Field(), BankField(), and IndexField(). BZ 10606.

Implemented a fix for the Load operator, now load the table at the namespace root. This reverts a change introduced in version 20071019. The table is now
Implemented a fix for the Load operator, now load the table at the namespace root. This reverts a change introduced in version 20071019. The table is now loaded at the namespace root even though this goes against the ACPI **specification. This provides compatibility with other ACPI implementations. The ACPI specification will be updated to reflect this in ACPI 4.0. Lin Ming.**
specification. This provides compatibility with other ACPI implementations. The ACPI specification will be updated to reflect this in ACPI 4.0. Lin Ming.

Fixed a problem where ACPICA would not Load() tables with unusual signatures.
Fixed a problem where ACPICA would not Load() tables with unusual signatures. Now ignore ACPI table signature for Load() operator. Only "SSDT" is acceptable to the ACPI spec, but tables are seen with OEMx and null sigs. **Therefore, signature validation is worthless. Apparently MS ACPI accepts such**
Therefore, signature validation is worthless. Apparently MS ACPI accepts such signatures, ACPICA must be compatible. BZ 10454.

Fixed a possible negative array index in AcpiUtValidateException. Added NULL fields to the exception string arrays to eliminate a -1 subtraction on the
Fixed a possible negative array index in AcpiUtValidateException. Added NULL fields to the exception string arrays to eliminate a -1 subtraction on the SubStatus field.

Updated the debug tracking macros to reduce overall code and data size. Changed ACPI_MODULE_NAME and ACPI_FUNCTION_NAME to use arrays of strings instead of pointers to static strings. Jan Beulich and Bob Moore.

Implemented argument count checking in control method invocation via **AcpiEvaluateObject. Now emit an error if too few arguments, warning if too many. This applies only to extern programmatic control method execution, not**
AcpiEvaluateObject. Now emit an error if too few arguments, warning if too many. This applies only to extern programmatic control method execution, not method-to-method calls within the AML. Lin Ming.

Eliminated the ACPI_NATIVE_UINT type across all ACPICA code. This type is no longer needed, especially with the removal of 16-bit support. It was replaced mostly with UINT32, but also ACPI_SIZE where a type that changes 32/64 bit on
Eliminated the ACPI_NATIVE_UINT type across all ACPICA code. This type is no longer needed, especially with the removal of 16-bit support. It was replaced mostly with UINT32, but also ACPI_SIZE where a type that changes 32/64 bit on 32/64-bit platforms is required.

Added the C const qualifier for appropriate string constants -- mostly MODULE_NAME and printf format strings. Jan Beulich.

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The **debug version of the code includes the debug output trace mechanism and has a**

21 March 2008. Summary of changes for version 20080321:

1) ACPI CA Core Subsystem:

Implemented an additional change to the GPE support in order to suppress **spurious or stray GPEs. The AcpiEvDisableGpe function will now permanently disable incoming GPEs that are neither enabled nor disabled -- meaning that the GPE is unknown to the system. This should prevent future interrupt floods**
spurious or stray GPEs. The AcpiEvDisableGpe function will now permanently disable incoming GPEs that are neither enabled nor disabled -- meaning that the GPE is unknown to the system. This should prevent future interrupt floods from that GPE. BZ 6217 (Zhang Rui)

Fixed a problem where NULL package elements were not returned to the AcpiEvaluateObject interface correctly. The element was simply ignored **instead of returning a NULL ACPI_OBJECT package element, potentially causing a buffer overflow and/or confusing the caller who expected a fixed number of**
instead of returning a NULL ACPI_OBJECT package element, potentially causing a buffer overflow and/or confusing the caller who expected a fixed number of elements. BZ 10132 (Lin Ming, Bob Moore)

Fixed a problem with the CreateField, CreateXXXField (Bit, Byte, Word, Dword, Qword), Field, BankField, and IndexField operators when invoked from inside an executing control method. In this case, these operators created namespace
Fixed a problem with the CreateField, CreateXXXField (Bit, Byte, Word, Dword, Qword), Field, BankField, and IndexField operators when invoked from inside an executing control method. In this case, these operators created namespace nodes that were incorrectly left marked as permanent nodes instead of temporary nodes. This could cause a problem if there is race condition **between an exiting control method and a running namespace walk. (Reported by**
between an exiting control method and a running namespace walk. (Reported by Linn Crosetto)

Fixed a problem where the CreateField and CreateXXXField operators would **incorrectly allow duplicate names (the name of the field) with no exception** *incorrectly allow duplicate names (the name of the field) with no exception* generated.

Implemented several changes for Notify handling. Added support for new Notify *Implemented several changes for Notify handling. Added support for new Notify* values (ACPI 2.0+) and improved the Notify debug output. Notify on **PowerResource objects is no longer allowed, as per the ACPI specification.** *PowerResource objects is no longer allowed, as per the ACPI specification.* (Bob Moore, Zhang Rui)

All Reference Objects returned via the AcpiEvaluateObject interface are now marked as type "REFERENCE" instead of "ANY". The type ANY is now reserved for NULL objects - either NULL package elements or unresolved named references. *All Reference Objects returned via the AcpiEvaluateObject interface are now marked as type "REFERENCE" instead of "ANY". The type ANY is now reserved for NULL objects - either NULL package elements or unresolved named references.*

Fixed a problem where an extraneous debug message was produced for package *Fixed a problem where an extraneous debug message was produced for package* objects (when debugging enabled). The message "Package List length larger **than NumElements count" is now produced in the correct case, and is now an** *than NumElements count" is now produced in the correct case, and is now an* error message rather than a debug message. Added a debug message for the **opposite case, where NumElements is larger than the Package List (the package** *opposite case, where NumElements is larger than the Package List (the package* will be padded out with NULL elements as per the ACPI spec.)

Implemented several improvements for the output of the ASL "Debug" object to *Implemented several improvements for the output of the ASL "Debug" object to* clarify and keep all data for a given object on one output line.

Fixed two size calculation issues with the variable-length Start Dependent *Fixed two size calculation issues with the variable-length Start Dependent* resource descriptor.

13 February 2008. Summary of changes for version 20080213:

1) ACPI CA Core Subsystem:

Implemented another MS compatibility design change for GPE/Notify handling. GPEs are now cleared/enabled asynchronously to allow all pending notifies to *Implemented another MS compatibility design change for GPE/Notify handling. GPEs are now cleared/enabled asynchronously to allow all pending notifies to* complete first. It is expected that the OSL will queue the enable request **behind all pending notify requests (may require changes to the local host OSL** *behind all pending notify requests (may require changes to the local host OSL* in AcpiOsExecute). Alexey Starikovskiy.

Fixed a problem where buffer and package objects passed as arguments to a **control method via the external AcpiEvaluateObject interface could cause an** *control method via the external AcpiEvaluateObject interface could cause an* AE_AML_INTERNAL exception depending on the order and type of operators executed by the target control method.

Fixed a problem where resource descriptor size optimization could cause a **problem when a _CRS resource template is passed to a _SRS method. The _SRS** *problem when a _CRS resource template is passed to a _SRS method. The _SRS* resource template must use the same descriptors (with the same size) as **returned from _CRS. This change affects the following resource descriptors: IRQ / IRQNoFlags and StartDependendentFn / StartDependentFnNoPri. (BZ 9487)** *returned from _CRS. This change affects the following resource descriptors: IRQ / IRQNoFlags and StartDependendentFn / StartDependentFnNoPri. (BZ 9487)*

Fixed a problem where a CopyObject to RegionField, BankField, and IndexField objects did not perform an implicit conversion as it should. These types must retain their initial type permanently as per the ACPI specification. However, *Fixed a problem where a CopyObject to RegionField, BankField, and IndexField objects did not perform an implicit conversion as it should. These types must retain their initial type permanently as per the ACPI specification. However,* a CopyObject to all other object types should not perform an implicit conversion, as per the ACPI specification. (Lin Ming, Bob Moore) BZ 388

Fixed a problem with the AcpiGetDevices interface where the mechanism to match device CIDs did not examine the entire list of available CIDs, but instead aborted on the first non-matching CID. Andrew Patterson.

Fixed a regression introduced in version 20071114. The ACPI_HIDWORD macro was

Fixed a regression introduced in version 20071114. The ACPI_HIDWORD macro was
inadvertently changed to return a 16-bit value instead of a 32-bit value,
truncating the upper dword of a 64-bit value. This macro is only used to
display debug output, so no incorrect calculations were made. Also,
reimplemented the macro so that a 64-bit shift is not performed by
inefficient compilers.

Added missing va_end statements that should correspond with each va_start
statement.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

```

    Debug Version:     158.9K Code, 64.0K Data, 222.9K Total
```

2) iASL Compiler/Disassembler and Tools:

Implemented full disassembler support for the following new ACPI tables:
BERT, EINJ, and ERST. Implemented partial disassembler support for the
complicated HEST table. These tables support the Windows Hardware Error
Architecture (WHEA).

---
23 January 2008. Summary of changes for version 20080123:

1) ACPI CA Core Subsystem:

Added the 2008 copyright to all module headers and signons. This affects
virtually every file in the ACPICA core subsystem, the iASL compiler, and
the tools/utilities.

Fixed a problem with the SizeOf operator when used with Package and
Buffer
objects. These objects have deferred execution for some arguments, and
the
execution is now completed before the SizeOf is executed. This problem
caused
unexpected AE_PACKAGE_LIMIT errors on some systems (Lin Ming, Bob Moore)

---
19 October 2007. Summary of changes for version 20071019:

1) ACPI CA Core Subsystem:

Fixed a problem with the Alias operator when the target of the alias is a
named ASL operator that opens a new scope -- Scope, Device,
PowerResource,
named ASL operator that opens a new scope -- Scope, Device, PowerResource,
Processor, and ThermalZone. In these cases, any children of the original
operator could not be accessed via the alias, potentially causing
unexpected
operator could not be accessed via the alias, potentially causing unexpected
AE_NOT_FOUND exceptions. (BZ 9067)

Fixed a problem with the Package operator where all named references were
created as object references and left otherwise unresolved. According to
the
ACPI specification, a Package can only contain Data Objects or references
to
created as object references and left otherwise unresolved. According to the
ACPI specification, a Package can only contain Data Objects or references to
control methods. The implication is that named references to Data Objects
(Integer, Buffer, String, Package, BufferField, Field) should be resolved
immediately upon package creation. This is the approach taken with this
change. References to all other named objects (Methods, Devices, Scopes,
etc.) are all now properly created as reference objects. (BZ 5328)

Reverted a change to Notify handling that was introduced in version
20070508. This version changed the Notify handling from asynchronous to
fully synchronous (Device driver Notify handling with respect to the
Notify
fully synchronous (Device driver Notify handling with respect to the Notify
ASL operator). It was found that this change caused more problems than it
solved and was removed by most users.

Fixed a problem with the Increment and Decrement operators where the type
of
Fixed a problem with the Increment and Decrement operators where the type of
the target object could be unexpectedly and incorrectly changed. (BZ 353)
Lin Ming.

Fixed a problem with the Load and LoadTable operators where the table
location within the namespace was ignored. Instead, the table was always
loaded into the root or current scope. Lin Ming.

Fixed a problem with the Load operator when loading a table from a buffer
object. The input buffer was prematurely zeroed and/or deleted. (BZ 577)

Fixed a problem with the Debug object where a store of a DdbHandle
reference
Fixed a problem with the Debug object where a store of a DdbHandle reference
object to the Debug object could cause a fault.

Added a table checksum verification for the Load operator, in the case
where
Added a table checksum verification for the Load operator, in the case where
the load is from a buffer. (BZ 578).

Implemented additional parameter validation for the LoadTable operator.
The
length of the input strings SignatureString, OemIdString, and OemTableId
are
Implemented additional parameter validation for the LoadTable operator. The
length of the input strings SignatureString, OemIdString, and OemTableId are
now checked for maximum lengths. (BZ 582) Lin Ming.

Example Code and Data Size: These are the sizes for the OS-independent

    Debug Version:     157.2K Code, 63.4K Data, 220.6K Total
```

2) iASL Compiler/Disassembler:

Fixed a problem where if a single file was specified and the file did not
exist, no error message was emitted. (Introduced with wildcard support in
version 20070917.)

---
19 September 2007. Summary of changes for version 20070919:

1) ACPI CA Core Subsystem:

Designed and implemented new external interfaces to install and remove
**handlers for ACPI table-related events. Current events that are defined
are**
handlers for ACPI table-related events. Current events that are defined are
LOAD and UNLOAD. These interfaces allow the host to track ACPI tables as
they are dynamically loaded and unloaded. See AcpiInstallTableHandler and
AcpiRemoveTableHandler. (Lin Ming and Bob Moore)

Fixed a problem where the use of the AcpiGbl_AllMethodsSerialized flag
(acpi_serialized option on Linux) could cause some systems to hang during
initialization. (Bob Moore) BZ 8171

Fixed a problem where objects of certain types (Device, ThermalZone,
Processor, PowerResource) can be not found if they are declared and
referenced from within the same control method (Lin Ming) BZ 341

Example Code and Data Size: These are the sizes for the OS-independent

thread that executed the Notify() now waits at a synchronization point
for
the notify handler to complete. Some machines depend on a synchronous
Notify**
still executes the notify handlers in a different thread, but the original
thread that executed the Notify() now waits at a synchronization point for
the notify handler to complete. Some machines depend on a synchronous Notify
operator in order to operate correctly.

Implemented support to allow Package objects to be passed as method
arguments to the external AcpiEvaluateObject interface. Previously, this
would return the AE_NOT_IMPLEMENTED exception. This feature had not been
implemented since there were no reserved control methods that required it
until recently.

**Fixed a problem with the internal FADT conversion where ACPI 1.0 FADTs
that**
Fixed a problem with the internal FADT conversion where ACPI 1.0 FADTs that
contained invalid non-zero values in reserved fields could cause later
**failures because these fields have meaning in later revisions of the
FADT.
For incoming ACPI 1.0 FADTs, these fields are now always zeroed. (The
fields**
failures because these fields have meaning in later revisions of the FADT.
For incoming ACPI 1.0 FADTs, these fields are now always zeroed. (The fields
are: Preferred_PM_Profile, PSTATE_CNT, CST_CNT, and IAPC_BOOT_FLAGS.)

20 March 2007. Summary of changes for version 20070320:

1) ACPI CA Core Subsystem:

Implemented a change to the order of interpretation and evaluation of AML
operand objects within the AML interpreter. The interpreter now evaluates
operands in the order that they appear in the AML stream (and the
**corresponding ASL code), instead of in the reverse order (after the
entire
operand list has been parsed). The previous behavior caused several
subtle**
corresponding ASL code), instead of in the reverse order (after the entire
operand list has been parsed). The previous behavior caused several subtle
incompatibilities with the Microsoft AML interpreter as well as being
somewhat non-intuitive. BZ 7871, local BZ 263. Valery Podrezov.

**Implemented a change to the ACPI Global Lock support. All interfaces to
the**

Implemented a change to the ACPI Global Lock support. All interfaces to the global lock now allow the same thread to acquire the lock multiple times. **This affects the AcpiAcquireGlobalLock external interface to the global lock** *This affects the AcpiAcquireGlobalLock external interface to the global lock* as well as the internal use of the global lock to support AML fields -- a **control method that is holding the global lock can now simultaneously access AML fields that require global lock protection. Previously, in both cases, this would have resulted in an AE_ALREADY_ACQUIRED exception. The change to** *control method that is holding the global lock can now simultaneously access AML fields that require global lock protection. Previously, in both cases, this would have resulted in an AE_ALREADY_ACQUIRED exception. The change to* AcpiAcquireGlobalLock is of special interest to drivers for the Embedded **Controller. There is no change to the behavior of the AML Acquire operator,** *Controller. There is no change to the behavior of the AML Acquire operator,* as this can already be used to acquire a mutex multiple times by the same thread. BZ 8066. With assistance from Alexey Starikovskiy.

Fixed a problem where invalid objects could be referenced in the AML **Interpreter after error conditions. During operand evaluation, ensure that** *Interpreter after error conditions. During operand evaluation, ensure that* the internal "Return Object" field is cleared on error and only valid **pointers are stored there. Caused occasional access to deleted objects that** *pointers are stored there. Caused occasional access to deleted objects that* resulted in "large reference count" warning messages. Valery Podrezov.

Fixed a problem where an AE_STACK_OVERFLOW internal exception could occur on *Fixed a problem where an AE_STACK_OVERFLOW internal exception could occur on* deeply nested control method invocations. BZ 7873, local BZ 487. Valery Podrezov.

Fixed an internal problem with the handling of result objects on the interpreter result stack. BZ 7872. Valery Podrezov.

Removed obsolete code that handled the case where AML_NAME_OP is the target *Removed obsolete code that handled the case where AML_NAME_OP is the target* of a reference (Reference.Opcode). This code was no longer necessary. BZ 7874. Valery Podrezov.

Removed obsolete ACPI_NO_INTEGER64_SUPPORT from two header files. This was a *Removed obsolete ACPI_NO_INTEGER64_SUPPORT from two header files. This was a* remnant from the previously discontinued 16-bit support.

    Debug Version:     155.8K Code, 63.3K Data, 219.1K Total
```

2) iASL Compiler/Disassembler and Tools:

AcpiExec: Implemented a new option (-m) to display full memory use
statistics upon subsystem/program termination. (Valery Podrezov)

---
09 November 2006. Summary of changes for version 20061109:

1) ACPI CA Core Subsystem:

Optimized the Load ASL operator in the case where the source operand is
an
Optimized the Load ASL operator in the case where the source operand is an
operation region. Simply map the operation region memory, instead of
performing a bytewise read. (Region must be of type SystemMemory, see
below.)

Fixed the Load ASL operator for the case where the source operand is a
region field. A buffer object is also allowed as the source operand. BZ
480
region field. A buffer object is also allowed as the source operand. BZ 480

Fixed a problem where the Load ASL operator allowed the source operand to
be
Fixed a problem where the Load ASL operator allowed the source operand to be
an operation region of any type. It is now restricted to regions of type
SystemMemory, as per the ACPI specification. BZ 481

Additional cleanup and optimizations for the new Table Manager code.

AcpiEnable will now fail if all of the required ACPI tables are not
loaded
AcpiEnable will now fail if all of the required ACPI tables are not loaded
(FADT, FACS, DSDT). BZ 477

Added #pragma pack(8/4) to acobject.h to ensure that the structures in
this
Added #pragma pack(8/4) to acobject.h to ensure that the structures in this
header are always compiled as aligned. The ACPI_OPERAND_OBJECT has been
manually optimized to be aligned and will not work if it is byte-packed.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

    Debug Version:     155.2K Code, 63.1K Data, 218.3K Total
```

2) iASL Compiler/Disassembler and Tools:

Fixed a problem where the presence of the _OSI predefined control method
within complex expressions could cause an internal compiler error.

AcpiExec: Implemented full region support for multiple address spaces.
SpaceId is now part of the REGION object. BZ 429

---
11 October 2006. Summary of changes for version 20061011:

1) ACPI CA Core Subsystem:

Completed an AML interpreter performance enhancement for control method
execution. Previously a 2-pass parse/execution, control methods are now
completely parsed and executed in a single pass. This improves overall
interpreter performance by ~25%, reduces code size, and reduces CPU stack
use. (Valery Podrezov + interpreter changes in version 20051202 that
eliminated namespace loading during the pass one parse.)

Implemented _CID support for PCI Root Bridge detection. If the _HID does
not
match the predefined PCI Root Bridge IDs, the _CID list (if present) is
now
Implemented _CID support for PCI Root Bridge detection. If the _HID does not
match the predefined PCI Root Bridge IDs, the _CID list (if present) is now
obtained and also checked for an ID match.

Implemented additional support for the PCI _ADR execution: upsearch until
a
Implemented additional support for the PCI _ADR execution: upsearch until a
device scope is found before executing _ADR. This allows PCI_Config
operation regions to be declared locally within control methods
underneath
operation regions to be declared locally within control methods underneath
PCI device objects.

Fixed a problem with a possible race condition between threads executing
AcpiWalkNamespace and the AML interpreter. This condition was removed by
modifying AcpiWalkNamespace to (by default) ignore all temporary
namespace
modifying AcpiWalkNamespace to (by default) ignore all temporary namespace
entries created during any concurrent control method execution. An
additional namespace race condition is known to exist between
AcpiWalkNamespace and the Load/Unload ASL operators and is still under
investigation.

Restructured the AML ParseLoop function, breaking it into several
subfunctions in order to reduce CPU stack use and improve
maintainability.
subfunctions in order to reduce CPU stack use and improve maintainability.
(Mikhail Kouzmich)

AcpiGetHandle: Fix for parameter validation to detect invalid
combinations
AcpiGetHandle: Fix for parameter validation to detect invalid combinations
of prefix handle and pathname. BZ 478

2) iASL Compiler/Disassembler and Tools:

Ported the -g option (get local ACPI tables) to the new ACPICA Table Manager
Ported the -g option (get local ACPI tables) to the new ACPICA Table Manager
to restore original behavior.

---
27 September 2006. Summary of changes for version 20060927:

1) ACPI CA Core Subsystem:

Removed the "Flags" parameter from AcpiGetRegister and AcpiSetRegister.
These functions now use a spinlock for mutual exclusion and the interrupt
level indication flag is not needed.

Fixed a problem with the Global Lock where the lock could appear to be
obtained before it is actually obtained. The global lock semaphore was
inadvertently created with one unit instead of zero units. (BZ 464) Fiodor
inadvertently created with one unit instead of zero units. (BZ 464) Fiodor
Suietov.

Fixed a possible memory leak and fault in AcpiExResolveObjectToValue during
Fixed a possible memory leak and fault in AcpiExResolveObjectToValue during
a read from a buffer or region field. (BZ 458) Fiodor Suietov.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

```
  Previous Release:

    Debug Version:     154.6K Code, 63.0K Data, 217.6K Total
```

2) iASL Compiler/Disassembler and Tools:

Fixed a compilation problem with the pre-defined Resource Descriptor field names where an "object does not exist" error could be incorrectly generated
Fixed a compilation problem with the pre-defined Resource Descriptor field names where an "object does not exist" error could be incorrectly generated
if the parent ResourceTemplate pathname places the template within a
different namespace scope than the current scope. (BZ 7212)

Fixed a problem where the compiler could hang after syntax errors

detected
Fixed a problem where the compiler could hang after syntax errors detected
in an ElseIf construct. (BZ 453)

Fixed a problem with the AmlFilename parameter to the DefinitionBlock()
operator. An incorrect output filename was produced when this parameter was
operator. An incorrect output filename was produced when this parameter was
a null string (""). Now, the original input filename is used as the AML
output filename, with an ".aml" extension.

Implemented a generic batch command mode for the AcpiExec utility (execute
Implemented a generic batch command mode for the AcpiExec utility (execute
any AML debugger command) (Valery Podrezov).

---
12 September 2006. Summary of changes for version 20060912:

1) ACPI CA Core Subsystem:

Enhanced the implementation of the "serialized mode" of the interpreter
(enabled via the AcpiGbl_AllMethodsSerialized flag.) When this mode is
specified, instead of creating a serialization semaphore per control method,
specified, instead of creating a serialization semaphore per control method,
the interpreter lock is simply no longer released before a blocking
operation during control method execution. This effectively makes the AML
Interpreter single-threaded. The overhead of a semaphore per-method is
eliminated.

Fixed a regression where an error was no longer emitted if a control method
Fixed a regression where an error was no longer emitted if a control method
attempts to create 2 objects of the same name. This once again returns
AE_ALREADY_EXISTS. When this exception occurs, it invokes the mechanism that
AE_ALREADY_EXISTS. When this exception occurs, it invokes the mechanism that
will dynamically serialize the control method to possible prevent future
errors. (BZ 440)

Integrated a fix for a problem with PCI Express HID detection in the PCI
Config Space setup procedure. (BZ 7145)

Moved all FADT-related functions to a new file, tbfadt.c. Eliminated the
AcpiHwInitialize function - the FADT registers are now validated when the
table is loaded.

Added two new warnings during FADT verification - 1) if the FADT is larger than the largest known FADT version, and 2) if there is a mismatch between a 32-bit block address and the 64-bit X counterpart (when both are non-zero.)
Added two new warnings during FADT verification - 1) if the FADT is larger than the largest known FADT version, and 2) if there is a mismatch between a 32-bit block address and the 64-bit X counterpart (when both are non-zero.)

2) iASL Compiler/Disassembler and Tools:

Fixed a problem with the implementation of the Switch() operator where
the
temporary variable was declared too close to the actual Switch, instead
of
Fixed a problem with the implementation of the Switch() operator where the
temporary variable was declared too close to the actual Switch, instead of
at method level. This could cause a problem if the Switch() operator is
within a while loop, causing an error on the second iteration. (BZ 460)

Disassembler - fix for error emitted for unknown type for target of scope
operator. Now, ignore it and continue.

Disassembly of an FADT now verifies the input FADT and reports any errors
found. Fix for proper disassembly of full-sized (ACPI 2.0) FADTs.

Disassembly of raw data buffers with byte initialization data now
prefixes
Disassembly of raw data buffers with byte initialization data now prefixes
each output line with the current buffer offset.

Disassembly of ASF! table now includes all variable-length data fields at
the end of some of the subtables.

The disassembler now emits a comment if a buffer appears to be a
ResourceTemplate, but cannot be disassembled as such because the EndTag
does
ResourceTemplate, but cannot be disassembled as such because the EndTag does
not appear at the very end of the buffer.

AcpiExec - Added the "-t" command line option to enable the serialized
mode
AcpiExec - Added the "-t" command line option to enable the serialized mode
of the AML interpreter.

---------------------------------------
31 August 2006. Summary of changes for version 20060831:

1) ACPI CA Core Subsystem:

Miscellaneous fixes for the Table Manager:
- Correctly initialize internal common FADT for all 64-bit "X" fields
- Fixed a couple table mapping issues during table load
- Fixed a couple alignment issues for IA64
- Initialize input array to zero in AcpiInitializeTables
- Additional parameter validation for AcpiGetTable, AcpiGetTableHeader,
AcpiGetTableByIndex

Change for GPE support: when a "wake" GPE is received, all wake GPEs are
now
Change for GPE support: when a "wake" GPE is received, all wake GPEs are now
immediately disabled to prevent the waking GPE from firing again and to
prevent other wake GPEs from interrupting the wake process.

Added the AcpiGpeCount global that tracks the number of processed GPEs,
to
Added the AcpiGpeCount global that tracks the number of processed GPEs, to
```

```
be used for debugging systems with a large number of ACPI interrupts.

Implemented support for the "DMAR" ACPI table (DMA Redirection Table) in
both the ACPICA headers and the disassembler.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

2) iASL Compiler/Disassembler and Tools:

Disassembler support for the DMAR ACPI table.

---------------------------------------
23 August 2006. Summary of changes for version 20060823:

1) ACPI CA Core Subsystem:

The Table Manager component has been completely redesigned and
reimplemented. The new design is much simpler, and reduces the overall
code
and data size of the kernel-resident ACPICA by approximately 5%. Also, it
is
reimplemented. The new design is much simpler, and reduces the overall code
and data size of the kernel-resident ACPICA by approximately 5%. Also, it is
now possible to obtain the ACPI tables very early during kernel
initialization, even before dynamic memory management is initialized.
(Alexey Starikovskiy, Fiodor Suietov, Bob Moore)

Obsolete ACPICA interfaces:

- AcpiGetFirmwareTable: Use AcpiGetTable instead (works at early kernel
init
- AcpiGetFirmwareTable: Use AcpiGetTable instead (works at early kernel init
time).
- AcpiLoadTable: Not needed.
- AcpiUnloadTable: Not needed.

New ACPICA interfaces:

- AcpiInitializeTables: Must be called before the table manager can be
used.
- AcpiInitializeTables: Must be called before the table manager can be used.
- AcpiReallocateRootTable: Used to transfer the root table to dynamically
allocated memory after it becomes available.
- AcpiGetTableByIndex: Allows the host to easily enumerate all ACPI
tables
- AcpiGetTableByIndex: Allows the host to easily enumerate all ACPI tables
in the RSDT/XSDT.

Other ACPICA changes:

- AcpiGetTableHeader returns the actual mapped table header, not a copy.
Use
- AcpiGetTableHeader returns the actual mapped table header, not a copy. Use
```

AcpiOsUnmapMemory to free this mapping.
- AcpiGetTable returns the actual mapped table. The mapping is managed
internally and must not be deleted by the caller. Use of this interface
causes no additional dynamic memory allocation.
- AcpiFindRootPointer: Support for physical addressing has been eliminated,
- AcpiFindRootPointer: Support for physical addressing has been eliminated,
it appeared to be unused.
- The interface to AcpiOsMapMemory has changed to be consistent with the
other allocation interfaces.
- The interface to AcpiOsGetRootPointer has changed to eliminate unnecessary
- The interface to AcpiOsGetRootPointer has changed to eliminate unnecessary
parameters.
- ACPI_PHYSICAL_ADDRESS is now 32 bits on 32-bit platforms, 64 bits on 64-
- ACPI_PHYSICAL_ADDRESS is now 32 bits on 32-bit platforms, 64 bits on 64-
bit platforms. Was previously 64 bits on all platforms.
- The interface to the ACPI Global Lock acquire/release macros have changed
- The interface to the ACPI Global Lock acquire/release macros have changed
slightly since ACPICA no longer keeps a local copy of the FACS with a
constructed pointer to the actual global lock.

Porting to the new table manager:

- AcpiInitializeTables: Must be called once, and can be called anytime
during the OS initialization process. It allows the host to specify an area
during the OS initialization process. It allows the host to specify an area
of memory to be used to store the internal version of the RSDT/XSDT (root
table). This allows the host to access ACPI tables before memory management
table). This allows the host to access ACPI tables before memory management
is initialized and running.
- AcpiReallocateRootTable: Can be called after memory management is running
- AcpiReallocateRootTable: Can be called after memory management is running
to copy the root table to a dynamically allocated array, freeing up the
scratch memory specified in the call to AcpiInitializeTables.
- AcpiSubsystemInitialize: This existing interface is independent of the
Table Manager, and does not have to be called before the Table Manager can
Table Manager, and does not have to be called before the Table Manager can
be used, it only must be called before the rest of ACPICA can be used.
- ACPI Tables: Some changes have been made to the names and structure of the
actbl.h and actbl1.h header files and may require changes to existing code.
For example, bitfields have been completely removed because of their lack of
- ACPI Tables: Some changes have been made to the names and structure of the
actbl.h and actbl1.h header files and may require changes to existing code.
For example, bitfields have been completely removed because of their lack of
portability across C compilers.
- Update interfaces to the Global Lock acquire/release macros if local
versions are used. (see acwin.h)

Obsolete files: tbconvrt.c, tbget.c, tbgetall.c, tbrsdt.c

New files: tbfind.c

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has

debug version of the code includes the debug output trace mechanism and has

2) iASL Compiler/Disassembler and Tools:

No changes for this release.

---

21 July 2006. Summary of changes for version 20060721:

1) ACPI CA Core Subsystem:

The full source code for the ASL test suite used to validate the iASL
compiler and the ACPICA core subsystem is being released with the ACPICA
source for the first time. The source is contained in a separate package and
consists of over 1100 files that exercise all ASL/AML operators. The package
should appear on the Intel/ACPI web site shortly. (Valery Podrezov, Fiodor
source for the first time. The source is contained in a separate package and
consists of over 1100 files that exercise all ASL/AML operators. The package
should appear on the Intel/ACPI web site shortly. (Valery Podrezov, Fiodor
Suietov)

Completed a new design and implementation for support of the ACPI Global
Lock. On the OS side, the global lock is now treated as a standard AML
mutex. Previously, multiple OS threads could "acquire" the global lock
simultaneously. However, this could cause the BIOS to be starved out of the
simultaneously. However, this could cause the BIOS to be starved out of the
lock - especially in cases such as the Embedded Controller driver where
there is a tight coupling between the OS and the BIOS.

Implemented an optimization for the ACPI Global Lock interrupt mechanism.
The Global Lock interrupt handler no longer queues the execution of a
separate thread to signal the global lock semaphore. Instead, the semaphore
separate thread to signal the global lock semaphore. Instead, the semaphore
is signaled directly from the interrupt handler.

Implemented support within the AML interpreter for package objects that
contain a larger AML length (package list length) than the package element
contain a larger AML length (package list length) than the package element
count. In this case, the length of the package is truncated to match the
package element count. Some BIOS code apparently modifies the package length
on the fly, and this change supports this behavior. Provides compatibility
package element count. Some BIOS code apparently modifies the package length
on the fly, and this change supports this behavior. Provides compatibility
with the MS AML interpreter. (With assistance from Fiodor Suietov)

Implemented a temporary fix for the BankValue parameter of a Bank Field to
Implemented a temporary fix for the BankValue parameter of a Bank Field to
support all constant values, now including the Zero and One opcodes.

Evaluation of this parameter must eventually be converted to a full TermArg evaluation. A not-implemented error is now returned (temporarily) for non-
Evaluation of this parameter must eventually be converted to a full TermArg evaluation. A not-implemented error is now returned (temporarily) for non-
constant values for this parameter.

Fixed problem reports (Fiodor Suietov) integrated:
- Fix for premature object deletion after CopyObject on Operation Region (BZ
- Fix for premature object deletion after CopyObject on Operation Region (BZ
350)

2) iASL Compiler/Disassembler and Tools:

No changes for this release.

---

07 July 2006. Summary of changes for version 20060707:

1) ACPI CA Core Subsystem:

Added the ACPI_PACKED_POINTERS_NOT_SUPPORTED macro to support C compilers that do not allow the initialization of address pointers within packed structures - even though the hardware itself may support misaligned transfers. Some of the debug data structures are packed by default to minimize size.

Added an error message for the case where AcpiOsGetThreadId() returns zero.
Added an error message for the case where AcpiOsGetThreadId() returns zero.
A non-zero value is required by the core ACPICA code to ensure the proper operation of AML mutexes and recursive control methods.

The DSDT is now the only ACPI table that determines whether the AML **interpreter is in 32-bit or 64-bit mode. Not really a functional change, but the hooks for per-table 32/64 switching have been removed from the code. A**
interpreter is in 32-bit or 64-bit mode. Not really a functional change, but the hooks for per-table 32/64 switching have been removed from the code. A
clarification to the ACPI specification is forthcoming in ACPI 3.0B.

Fixed a possible leak of an OwnerID in the error path of AcpiTbInitTableDescriptor (tbinstal.c), and migrated all table OwnerID **deletion to a single place in AcpiTbUninstallTable to correct possible leaks**
deletion to a single place in AcpiTbUninstallTable to correct possible leaks
when using the AcpiTbDeleteTablesByType interface (with assistance from Lance Ortiz.)

Fixed a problem with Serialized control methods where the semaphore associated with the method could be over-signaled after multiple method invocations.

Fixed two issues with the locking of the internal namespace data structure.
Fixed two issues with the locking of the internal namespace data structure.
Both the Unload() operator and AcpiUnloadTable interface now lock the namespace during the namespace deletion associated with the table unload (with assistance from Linn Crosetto.)

Fixed problem reports (Valery Podrezov) integrated:
- Eliminate unnecessary memory allocation for CreateXxxxField (BZ 5426)

Fixed problem reports (Fiodor Suietov) integrated:
- Incomplete cleanup branches in AcpiTbGetTableRsdt (BZ 369)
- On Address Space handler deletion, needless deactivation call (BZ 374)
- AcpiRemoveAddressSpaceHandler: validate Device handle parameter (BZ 375)
- Possible memory leak, Notify sub-objects of Processor, Power, ThermalZone
- AcpiRemoveAddressSpaceHandler: validate Device handle parameter (BZ 375)
- Possible memory leak, Notify sub-objects of Processor, Power, ThermalZone
(BZ 376)
- AcpiRemoveAddressSpaceHandler: validate Handler parameter (BZ 378)
- Minimum Length of RSDT should be validated (BZ 379)
- AcpiRemoveNotifyHandler: return AE_NOT_EXIST if Processor Obj has no Handler (BZ (380)
- AcpiUnloadTable: return AE_NOT_EXIST if no table of specified type loaded
- AcpiUnloadTable: return AE_NOT_EXIST if no table of specified type loaded
(BZ 381)

2) iASL Compiler/Disassembler and Tools:

Fixed problem reports:
Compiler segfault when ASL contains a long (>1024) String declaration (BZ 436)

---

23 June 2006. Summary of changes for version 20060623:

1) ACPI CA Core Subsystem:

Implemented a new ACPI_SPINLOCK type for the OSL lock interfaces. This allows the type to be customized to the host OS for improved efficiency (since a spinlock is usually a very small object.)

Implemented support for "ignored" bits in the ACPI registers. According to

Implemented support for "ignored" bits in the ACPI registers. According to
the ACPI specification, these bits should be preserved when writing the
registers via a read/modify/write cycle. There are 3 bits preserved in
this
registers via a read/modify/write cycle. There are 3 bits preserved in this
manner: PM1_CONTROL[0] (SCI_EN), PM1_CONTROL[9], and PM1_STATUS[11].

Implemented the initial deployment of new OSL mutex interfaces. Since
some
Implemented the initial deployment of new OSL mutex interfaces. Since some
host operating systems have separate mutex and semaphore objects, this
feature was requested. The base code now uses mutexes (and the new mutex
interfaces) wherever a binary semaphore was used previously. However, for
the current release, the mutex interfaces are defined as macros to map
them
to the existing semaphore interfaces. Therefore, no OSL changes are
required
the current release, the mutex interfaces are defined as macros to map them
to the existing semaphore interfaces. Therefore, no OSL changes are required
at this time. (See acpiosxf.h)

Fixed several problems with the support for the control method SyncLevel
parameter. The SyncLevel now works according to the ACPI specification
and
in concert with the Mutex SyncLevel parameter, since the current
SyncLevel
is a property of the executing thread. Mutual exclusion for control
methods
parameter. The SyncLevel now works according to the ACPI specification and
in concert with the Mutex SyncLevel parameter, since the current SyncLevel
is a property of the executing thread. Mutual exclusion for control methods
is now implemented with a mutex instead of a semaphore.

Fixed three instances of the use of the C shift operator in the bitfield
support code (exfldio.c) to avoid the use of a shift value larger than
the
target data width. The behavior of C compilers is undefined in this case
and
can cause unpredictable results, and therefore the case must be detected
and
support code (exfldio.c) to avoid the use of a shift value larger than the
target data width. The behavior of C compilers is undefined in this case and
can cause unpredictable results, and therefore the case must be detected and
avoided. (Fiodor Suietov)

Added an info message whenever an SSDT or OEM table is loaded dynamically
via the Load() or LoadTable() ASL operators. This should improve
debugging
capability since it will show exactly what tables have been loaded
(beyond
via the Load() or LoadTable() ASL operators. This should improve debugging
capability since it will show exactly what tables have been loaded (beyond
the tables present in the RSDT/XSDT.)

08 June 2006. Summary of changes for version 20060608:

1) ACPI CA Core Subsystem:

Converted the locking mutex used for the ACPI hardware to a spinlock.
This
Converted the locking mutex used for the ACPI hardware to a spinlock. This
change should eliminate all problems caused by attempting to acquire a
semaphore at interrupt level, and it means that all ACPICA external
interfaces that directly access the ACPI hardware can be safely called
from
interrupt level. OSL code that implements the semaphore interfaces should
be
interfaces that directly access the ACPI hardware can be safely called from
interrupt level. OSL code that implements the semaphore interfaces should be
able to eliminate any workarounds for being called at interrupt level.

Fixed a regression introduced in 20060526 where the ACPI device
initialization could be prematurely aborted with an AE_NOT_FOUND if a
device
initialization could be prematurely aborted with an AE_NOT_FOUND if a device
did not have an optional _INI method.

Fixed an IndexField issue where a write to the Data Register should be
limited in size to the AccessSize (width) of the IndexField itself. (BZ
433,
limited in size to the AccessSize (width) of the IndexField itself. (BZ 433,
Fiodor Suietov)

Fixed problem reports (Valery Podrezov) integrated:
- Allow store of ThermalZone objects to Debug object (BZ 5369/5370)

Fixed problem reports (Fiodor Suietov) integrated:
- AcpiGetTableHeader doesn’t handle multiple instances correctly (BZ 364)

Removed four global mutexes that were obsolete and were no longer being
used.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

```
  Previous Release:

    Debug Version:     160.2K Code, 64.7K Data, 224.9K Total
```

2) iASL Compiler/Disassembler and Tools:

Fixed a fault when using -g option (get tables from registry) on Windows
machines.

Fixed problem reports integrated:
- Generate error if CreateField NumBits parameter is zero. (BZ 405)
- Fault if Offset/Length in Field unit is very large (BZ 432, Fiodor Suietov)
- Global table revision override (-r) is ignored (BZ 413)

---
26 May 2006. Summary of changes for version 20060526:

1) ACPI CA Core Subsystem:

Restructured, flattened, and simplified the internal interfaces for **namespace object evaluation - resulting in smaller code, less CPU stack use,** *namespace object evaluation - resulting in smaller code, less CPU stack use,* and fewer interfaces. (With assistance from Mikhail Kouzmich)

Fixed a problem with the CopyObject operator where the first parameter was not typed correctly for the parser, interpreter, compiler, and disassembler. *Fixed a problem with the CopyObject operator where the first parameter was not typed correctly for the parser, interpreter, compiler, and disassembler.* Caused various errors and unexpected behavior.

Fixed a problem where a ShiftLeft or ShiftRight of more than 64 bits produced incorrect results with some C compilers. Since the behavior of C compilers when the shift value is larger than the datatype width is **apparently not well defined, the interpreter now detects this condition and** *apparently not well defined, the interpreter now detects this condition and* simply returns zero as expected in all such cases. (BZ 395)

Fixed problem reports (Valery Podrezov) integrated:
- Update String-to-Integer conversion to match ACPI 3.0A spec (BZ 5329)
- Allow interpreter to handle nested method declarations (BZ 5361)

Fixed problem reports (Fiodor Suietov) integrated:
- AcpiTerminate doesn’t free debug memory allocation list objects (BZ 355)
- After Core Subsystem shutdown, AcpiSubsystemStatus returns AE_OK (BZ 356)
- AcpiTerminate doesn’t free debug memory allocation list objects (BZ 355)
- After Core Subsystem shutdown, AcpiSubsystemStatus returns AE_OK (BZ 356)
- AcpiOsUnmapMemory for RSDP can be invoked inconsistently (BZ 357)
- Resource Manager should return AE_TYPE for non-device objects (BZ 358)
- Incomplete cleanup branch in AcpiNsEvaluateRelative (BZ 359)
- Use AcpiOsFree instead of ACPI_FREE in AcpiRsSetSrsMethodData (BZ 360)
- Incomplete cleanup branch in AcpiPsParseAml (BZ 361)
- Incomplete cleanup branch in AcpiDsDeleteWalkState (BZ 362)
- AcpiGetTableHeader returns AE_NO_ACPI_TABLES until DSDT is loaded (BZ 365)
- AcpiGetTableHeader returns AE_NO_ACPI_TABLES until DSDT is loaded (BZ 365)
- Status of the Global Initialization Handler call not used (BZ 366)
- Incorrect object parameter to Global Initialization Handler (BZ 367)

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The **debug version of the code includes the debug output trace mechanism and has** *debug version of the code includes the debug output trace mechanism and has* a much larger code and data size.

  Previous Release:
    Non-Debug Version: 79.8K Code, 17.7K Data, 97.5K Total

    Debug Version: 160.3K Code, 64.9K Data, 225.2K Total

2) iASL Compiler/Disassembler and Tools:

Modified the parser to allow the names IO, DMA, and IRQ to be used as namespace identifiers with no collision with existing resource descriptor macro names. This provides compatibility with other ASL compilers and is **most useful for disassembly/recompilation of existing tables without parse** *most useful for disassembly/recompilation of existing tables without parse* errors. (With assistance from Thomas Renninger)

Disassembler: fixed an incorrect disassembly problem with the DataTableRegion and CopyObject operators. Fixed a possible fault during disassembly of some Alias operators.

---
12 May 2006. Summary of changes for version 20060512:

1) ACPI CA Core Subsystem:

Replaced the AcpiOsQueueForExecution interface with a new interface named **AcpiOsExecute. The major difference is that the new interface does not have a Priority parameter, this appeared to be useless and has been replaced by a** *AcpiOsExecute. The major difference is that the new interface does not have a Priority parameter, this appeared to be useless and has been replaced by a* Type parameter. The Type tells the host what type of execution is being requested, such as global lock handler, notify handler, GPE handler, etc. **This allows the host to queue and execute the request as appropriate for the request type, possibly using different work queues and different priorities** *This allows the host to queue and execute the request as appropriate for the request type, possibly using different work queues and different priorities* for the various request types. This enables fixes for multithreading **deadlock problems such as BZ #5534, and will require changes to all existing** *deadlock problems such as BZ #5534, and will require changes to all existing* OS interface layers. (Alexey Starikovskiy and Bob Moore)

Fixed a possible memory leak associated with the support for the so-called *Fixed a possible memory leak associated with the support for the so-called* "implicit return" ACPI extension. Reported by FreeBSD, BZ #6514. (Fiodor Suietov)

Fixed a problem with the Load() operator where a table load from an **operation region could overwrite an internal table buffer by up to 7 bytes and cause alignment faults on IPF systems. (With assistance from Luming Yu)** *operation region could overwrite an internal table buffer by up to 7 bytes and cause alignment faults on IPF systems. (With assistance from Luming Yu)*

Example Code and Data Size: These are the sizes for the OS-independent acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The **debug version of the code includes the debug output trace mechanism and has** *debug version of the code includes the debug output trace mechanism and has* a much larger code and data size.

    Debug Version:     160.5K Code, 65.1K Data, 225.6K Total

2) iASL Compiler/Disassembler and Tools:

Disassembler: Implemented support to cross reference the internal
namespace
and automatically generate ASL External() statements for symbols not
defined
Disassembler: Implemented support to cross reference the internal namespace
and automatically generate ASL External() statements for symbols not defined
within the current table being disassembled. This will simplify the
disassembly and recompilation of interdependent tables such as SSDTs
since
disassembly and recompilation of interdependent tables such as SSDTs since
these statements will no longer have to be added manually.

Disassembler: Implemented experimental support to automatically detect
invocations of external control methods and generate appropriate
External()
statements. This is problematic because the AML cannot be correctly
parsed
until the number of arguments for each control method is known.
Currently,
invocations of external control methods and generate appropriate External()
statements. This is problematic because the AML cannot be correctly parsed
until the number of arguments for each control method is known. Currently,
standalone method invocations and invocations as the source operand of a
Store() statement are supported.

Disassembler: Implemented support for the ASL pseudo-operators LNotEqual,
LLessEqual, and LGreaterEqual. Previously disassembled as LNot(LEqual()),
LNot(LGreater()), and LNot(LLess()), this makes the disassembled ASL code
more readable and likely closer to the original ASL source.

----------------------------------------
21 April 2006. Summary of changes for version 20060421:

1) ACPI CA Core Subsystem:

Removed a device initialization optimization introduced in 20051216 where
the _STA method was not run unless an _INI was also present for the same
device. This optimization could cause problems because it could allow
_INI
device. This optimization could cause problems because it could allow _INI
methods to be run within a not-present device subtree. (If a not-present
device had no _INI, _STA would not be run, the not-present status would
not
device had no _INI, _STA would not be run, the not-present status would not
be discovered, and the children of the device would be incorrectly
traversed.)

Implemented a new _STA optimization where namespace subtrees that do not
contain _INI are identified and ignored during device initialization.
Selectively running _STA can significantly improve boot time on large
machines (with assistance from Len Brown.)

Implemented support for the device initialization case where the returned
_STA flags indicate a device not-present but functioning. In this case,
```

```
_INI
_STA flags indicate a device not-present but functioning. In this case, _INI
is not run, but the device children are examined for presence, as per the
ACPI specification.

Implemented an additional change to the IndexField support in order to
conform to MS behavior. The value written to the Index Register is not
simply a byte offset, it is a byte offset in units of the access width of
the parent Index Field. (Fiodor Suietov)

Defined and deployed a new OSL interface, AcpiOsValidateAddress. This
interface is called during the creation of all AML operation regions, and
allows the host OS to exert control over what addresses it will allow the
AML code to access. Operation Regions whose addresses are disallowed will
cause a runtime exception when they are actually accessed (will not
affect
cause a runtime exception when they are actually accessed (will not affect
or abort table loading.) See oswinxf or osunixxf for an example
implementation.

Defined and deployed a new OSL interface, AcpiOsValidateInterface. This
interface allows the host OS to match the various "optional"
interface/behavior strings for the _OSI predefined control method as
appropriate (with assistance from Bjorn Helgaas.) See oswinxf or osunixxf
for an example implementation.

Restructured and corrected various problems in the exception handling
code
Restructured and corrected various problems in the exception handling code
paths within DsCallControlMethod and DsTerminateControlMethod in dsmethod
(with assistance from Takayoshi Kochi.)

Modified the Linux source converter to ignore quoted string literals
while
converting identifiers from mixed to lower case. This will correct
problems
Modified the Linux source converter to ignore quoted string literals while
converting identifiers from mixed to lower case. This will correct problems
with the disassembler and other areas where such strings must not be
modified.

The ACPI_FUNCTION_* macros no longer require quotes around the function
name. This allows the Linux source converter to convert the names, now
that
name. This allows the Linux source converter to convert the names, now that
the converter ignores quoted strings.

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and
has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

2) iASL Compiler/Disassembler and Tools:

Implemented 3 new warnings for iASL, and implemented multiple warning
```

levels
Implemented 3 new warnings for iASL, and implemented multiple warning levels
(w2 flag).

1) Ignored timeouts: If the TimeoutValue parameter to Wait or Acquire is not
1) Ignored timeouts: If the TimeoutValue parameter to Wait or Acquire is not
WAIT_FOREVER (0xFFFF) and the code does not examine the return value to
check for the possible timeout, a warning is issued.

2) Useless operators: If an ASL operator does not specify an optional target
2) Useless operators: If an ASL operator does not specify an optional target
operand and it also does not use the function return value from the
operator, a warning is issued since the operator effectively does nothing.
operator, a warning is issued since the operator effectively does nothing.

3) Unreferenced objects: If a namespace object is created, but never
referenced, a warning is issued. This is a warning level 2 since there are
cases where this is ok, such as when a secondary table is loaded that uses
the unreferenced objects. Even so, care is taken to only flag objects that
referenced, a warning is issued. This is a warning level 2 since there are
cases where this is ok, such as when a secondary table is loaded that uses
the unreferenced objects. Even so, care is taken to only flag objects that
don’t look like they will ever be used. For example, the reserved methods
(starting with an underscore) are usually not referenced because it is
expected that the OS will invoke them.

---
31 March 2006. Summary of changes for version 20060331:

1) ACPI CA Core Subsystem:

Implemented header file support for the following additional ACPI tables:
ASF!, BOOT, CPEP, DBGP, MCFG, SPCR, SPMI, TCPA, and WDRT. With this support, all current and known ACPI tables are now defined in the ACPICA headers and
ASF!, BOOT, CPEP, DBGP, MCFG, SPCR, SPMI, TCPA, and WDRT. With this support,
all current and known ACPI tables are now defined in the ACPICA headers and
are available for use by device drivers and other software.

Implemented support to allow tables that contain ACPI names with invalid
characters to be loaded. Previously, this would cause the table load to
fail, but since there are several known cases of such tables on existing
machines, this change was made to enable ACPI support for them. Also, this
machines, this change was made to enable ACPI support for them. Also, this
matches the behavior of the Microsoft ACPI implementation.

Fixed a couple regressions introduced during the memory optimization in the
Fixed a couple regressions introduced during the memory optimization in the
20060317 release. The namespace node definition required additional
reorganization and an internal datatype that had been changed to 8-bit was
reorganization and an internal datatype that had been changed to 8-bit was
restored to 32-bit. (Valery Podrezov)

Fixed a problem where a null pointer passed to AcpiUtDeleteGenericState
could be passed through to AcpiOsReleaseObject which is unexpected. Such
null pointers are now trapped and ignored, matching the behavior of the

previous implementation before the deployment of AcpiOsReleaseObject.
(Valery Podrezov, Fiodor Suietov)

Fixed a memory mapping leak during the deletion of a SystemMemory operation
Fixed a memory mapping leak during the deletion of a SystemMemory operation
region where a cached memory mapping was not deleted. This became a
noticeable problem for operation regions that are defined within frequently
noticeable problem for operation regions that are defined within frequently
used control methods. (Dana Meyers)

Reorganized the ACPI table header files into two main files: one for the
ACPI tables consumed by the ACPICA core, and another for the miscellaneous
ACPI tables that are consumed by the drivers and other software. The various
ACPI tables consumed by the ACPICA core, and another for the miscellaneous
ACPI tables that are consumed by the drivers and other software. The various
FADT definitions were merged into one common section and three different
tables (ACPI 1.0, 1.0+, and 2.0)

Example Code and Data Size: These are the sizes for the OS-independent
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
debug version of the code includes the debug output trace mechanism and has
debug version of the code includes the debug output trace mechanism and has
a much larger code and data size.

```
  Previous Release:
    Non-Debug Version:  80.9K Code, 17.7K Data,  98.6K Total
    Debug Version:     158.7K Code, 64.8K Data, 223.5K Total
  Current Release:
    Non-Debug Version:  81.1K Code, 17.7K Data,  98.8K Total
    Debug Version:     158.9K Code, 64.9K Data, 223.8K Total
```

2) iASL Compiler/Disassembler and Tools:

Disassembler: Implemented support to decode and format all non-AML ACPI
tables (tables other than DSDTs and SSDTs.) This includes the new tables
added to the ACPICA headers, therefore all current and known ACPI tables are
added to the ACPICA headers, therefore all current and known ACPI tables are
supported.

Disassembler: The change to allow ACPI names with invalid characters also
enables the disassembly of such tables. Invalid characters within names are
enables the disassembly of such tables. Invalid characters within names are
changed to ’*’ to make the name printable; the iASL compiler will still
generate an error for such names, however, since this is an invalid ACPI
character.

Implemented an option for AcpiXtract (-a) to extract all tables found in the
Implemented an option for AcpiXtract (-a) to extract all tables found in the
input file. The default invocation extracts only the DSDTs and SSDTs.

Fixed a couple of gcc generation issues for iASL and AcpiExec and added a
makefile for the AcpiXtract utility.

---
17 March 2006. Summary of changes for version 20060317:

1) ACPI CA Core Subsystem:

Implemented the use of a cache object for all internal namespace nodes. Since there are about 1000 static nodes in a typical system, this will **decrease memory use for cache implementations that minimize per-allocation**
decrease memory use for cache implementations that minimize per-allocation overhead (such as a slab allocator.)

Removed the reference count mechanism for internal namespace nodes, since it
Removed the reference count mechanism for internal namespace nodes, since it was deemed unnecessary. This reduces the size of each namespace node by **about 5%-10% on all platforms. Nodes are now 20 bytes for the 32-bit case,**
about 5%-10% on all platforms. Nodes are now 20 bytes for the 32-bit case, and 32 bytes for the 64-bit case.

Optimized several internal data structures to reduce object size on 64-bit
Optimized several internal data structures to reduce object size on 64-bit platforms by packing data within the 64-bit alignment. This includes the frequently used ACPI_OPERAND_OBJECT, of which there can be ~1000 static instances corresponding to the namespace objects.

Added two new strings for the predefined _OSI method: "Windows 2001.1 SP1"
Added two new strings for the predefined _OSI method: "Windows 2001.1 SP1" and "Windows 2006".

Split the allocation tracking mechanism out to a separate file, from utalloc.c to uttrack.c. This mechanism appears to be only useful for application-level code. Kernels may wish to not include uttrack.c in distributions.

Removed all remnants of the obsolete ACPI_REPORT_* macros and the associated
Removed all remnants of the obsolete ACPI_REPORT_* macros and the associated code. (These macros have been replaced by the ACPI_ERROR and ACPI_WARNING macros.)

Code and Data Size: These are the sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output
Code and Data Size: These are the sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  81.0K Code, 17.8K Data,  98.8K Total
    Debug Version:     161.4K Code, 65.7K Data, 227.1K Total
  Current Release:
    Non-Debug Version:  81.1K Code, 17.8K Data,  98.9K Total
    Debug Version:     161.6K Code, 65.7K Data, 227.3K Total
```

2) iASL Compiler/Disassembler:

Disassembler: implemented support for symbolic resource descriptor references. If a CreateXxxxField operator references a fixed offset within a resource descriptor, a name is assigned to the descriptor and the offset is translated to the appropriate resource tag and pathname. The addition of this support brings the disassembled code very close to the original ASL source code and helps eliminate run-time errors when the disassembled code is modified (and recompiled) in such a way as to invalidate the original fixed offsets.

Implemented support for a Descriptor Name as the last parameter to the ASL Register() macro. This parameter was inadvertently left out of the ACPI specification, and will be added for ACPI 3.0b.

Fixed a problem where the use of the "_OSI" string (versus the full path "_OSI") caused an internal compiler error. ("No back ptr to op")

Fixed a problem with the error message that occurs when an invalid string is used for a _HID object (such as one with an embedded asterisk: "*PNP010A".) The correct message is now displayed.

---

17 February 2006. Summary of changes for version 20060217:

1) ACPI CA Core Subsystem:

Implemented a change to the IndexField support to match the behavior of the Microsoft AML interpreter. The value written to the Index register is now a byte offset, no longer an index based upon the width of the Data register. This should fix IndexField problems seen on some machines where the Data register is not exactly one byte wide. The ACPI specification will be clarified on this point.

Fixed a problem where several resource descriptor types could overrun the internal descriptor buffer due to size miscalculation: VendorShort, VendorLong, and Interrupt. This was noticed on IA64 machines, but could affect all platforms.

Fixed a problem where individual resource descriptors were misaligned within the internal buffer, causing alignment faults on IA64 platforms.

Code and Data Size: These are the sizes for the acpica.lib produced by

the Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output

Code and Data Size: These are the sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output

trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  81.1K Code, 17.8K Data,  98.9K Total
    Debug Version:     161.3K Code, 65.6K Data, 226.9K Total
  Current Release:
    Non-Debug Version:  81.0K Code, 17.8K Data,  98.8K Total
    Debug Version:     161.4K Code, 65.7K Data, 227.1K Total
```

2) iASL Compiler/Disassembler:

Implemented support for new reserved names: _WDG and _WED are Microsoft extensions for Windows Instrumentation Management, _TDL is a new ACPI-defined method (Throttling Depth Limit.)

Fixed a problem where a zero-length VendorShort or VendorLong resource descriptor was incorrectly emitted as a descriptor of length one.

---

10 February 2006. Summary of changes for version 20060210:

1) ACPI CA Core Subsystem:

Removed a couple of extraneous ACPI_ERROR messages that appeared during normal execution. These became apparent after the conversion from ACPI_DEBUG_PRINT.

Fixed a problem where the CreateField operator could hang if the BitIndex or NumBits parameter referred to a named object. (Valery Podrezov, BZ 5359)

Fixed a problem where a DeRefOf operation on a buffer object incorrectly failed with an exception. This also fixes a couple of related RefOf and DeRefOf issues. (Valery Podrezov, BZ 5360/5392/5387)

Fixed a problem where the AE_BUFFER_LIMIT exception was returned instead of AE_STRING_LIMIT on an out-of-bounds Index() operation. (Valery Podrezov, BZ 5480)

Implemented a memory cleanup at the end of the execution of each iteration of an AML While() loop, preventing the accumulation of outstanding objects. (Valery Podrezov, BZ 5427)

Eliminated a chunk of duplicate code in the object resolution code. (Valery

Podrezov, BZ 5336)

Fixed several warnings during the 64-bit code generation.

The AcpiSrc source code conversion tool now inserts one line of whitespace after an if() statement that is followed immediately by a comment, improving
The AcpiSrc source code conversion tool now inserts one line of whitespace after an if() statement that is followed immediately by a comment, improving readability of the Linux code.

Code and Data Size: The current and previous library sizes for the core subsystem are shown below. These are the code and data sizes for the **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These values do not include any ACPI driver or OSPM code. The debug version of the**

2) iASL Compiler/Disassembler:

Fixed a problem with the disassembly of a BankField operator with a complex
Fixed a problem with the disassembly of a BankField operator with a complex expression for the BankValue parameter.

---
27 January 2006. Summary of changes for version 20060127:

1) ACPI CA Core Subsystem:

Implemented support in the Resource Manager to allow unresolved namestring references within resource package objects for the _PRT method. This support
Implemented support in the Resource Manager to allow unresolved namestring references within resource package objects for the _PRT method. This support is in addition to the previously implemented unresolved reference support within the AML parser. If the interpreter slack mode is enabled, these **unresolved references will be passed through to the caller as a NULL package**
unresolved references will be passed through to the caller as a NULL package entry.

Implemented and deployed new macros and functions for error and warning messages across the subsystem. These macros are simpler and generate less code than their predecessors. The new macros ACPI_ERROR, ACPI_EXCEPTION, ACPI_WARNING, and ACPI_INFO replace the ACPI_REPORT_* macros. The older macros remain defined to allow ACPI drivers time to migrate to the new macros.

Implemented the ACPI_CPU_FLAGS type to simplify host OS integration of the
Implemented the ACPI_CPU_FLAGS type to simplify host OS integration of the Acquire/Release Lock OSL interfaces.

Fixed a problem where Alias ASL operators are sometimes not correctly resolved, in both the interpreter and the iASL compiler.

Fixed several problems with the implementation of the ConcatenateResTemplate
Fixed several problems with the implementation of the ConcatenateResTemplate ASL operator. As per the ACPI specification, zero length buffers are now treated as a single EndTag. One-length buffers always cause a fatal **exception. Non-zero length buffers that do not end with a full 2-byte EndTag**
exception. Non-zero length buffers that do not end with a full 2-byte EndTag cause a fatal exception.

Fixed a possible structure overwrite in the AcpiGetObjectInfo external interface. (With assistance from Thomas Renninger)

Code and Data Size: The current and previous library sizes for the core subsystem are shown below. These are the code and data sizes for the **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These values do not include any ACPI driver or OSPM code. The debug version of the**

```

2) iASL Compiler/Disassembler:

Fixed an internal error that was generated for any forward references to ASL
Fixed an internal error that was generated for any forward references to ASL Alias objects.

---
13 January 2006. Summary of changes for version 20060113:

1) ACPI CA Core Subsystem:

Added 2006 copyright to all module headers and signons. This affects virtually every file in the ACPICA core subsystem, iASL compiler, and the utilities.

Enhanced the ACPICA error reporting in order to simplify user migration to
Enhanced the ACPICA error reporting in order to simplify user migration to the non-debug version of ACPICA. Replaced all instances of the **ACPI_DEBUG_PRINT macro invoked at the ACPI_DB_ERROR and ACPI_DB_WARN debug**
ACPI_DEBUG_PRINT macro invoked at the ACPI_DB_ERROR and ACPI_DB_WARN debug

levels with the ACPI_REPORT_ERROR and ACPI_REPORT_WARNING macros,
respectively. This preserves all error and warning messages in the non-
debug
respectively. This preserves all error and warning messages in the non-debug
version of the ACPICA code (this has been referred to as the "debug lite"
option.) Over 200 cases were converted to create a total of over 380
error/warning messages across the ACPICA code. This increases the code
and
data size of the default non-debug version of the code somewhat (about
13K),
error/warning messages across the ACPICA code. This increases the code and
data size of the default non-debug version of the code somewhat (about 13K),
but all error/warning reporting may be disabled if desired (and code
eliminated) by specifying the ACPI_NO_ERROR_MESSAGES compile-time
configuration option. The size of the debug version of ACPICA remains
about
configuration option. The size of the debug version of ACPICA remains about
the same.

Fixed a memory leak within the AML Debugger "Set" command. One object was
not properly deleted for every successful invocation of the command.

Code and Data Size: The current and previous library sizes for the core
subsystem are shown below. These are the code and data sizes for the
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.

```

2) iASL Compiler/Disassembler:

The compiler now officially supports the ACPI 3.0a specification that was
released on December 30, 2005. (Specification is available at
www.acpi.info)
released on December 30, 2005. (Specification is available at www.acpi.info)

---
16 December 2005. Summary of changes for version 20051216:

1) ACPI CA Core Subsystem:

Implemented optional support to allow unresolved names within ASL Package
objects. A null object is inserted in the package when a named reference
cannot be located in the current namespace. Enabled via the interpreter
slack flag, this should eliminate AE_NOT_FOUND exceptions seen on
machines
slack flag, this should eliminate AE_NOT_FOUND exceptions seen on machines
that contain such code.

Implemented an optimization to the initialization sequence that can
improve

boot time. During ACPI device initialization, the _STA method is now run
if
and only if the _INI method exists. The _STA method is used to determine
if
the device is present; An _INI can only be run if _STA returns present,
but
Implemented an optimization to the initialization sequence that can improve
boot time. During ACPI device initialization, the _STA method is now run if
and only if the _INI method exists. The _STA method is used to determine if
the device is present; An _INI can only be run if _STA returns present, but
it is a waste of time to run the _STA method if the _INI does not exist.
(Prototype and assistance from Dong Wei)

Implemented use of the C99 uintptr_t for the pointer casting macros if it
is
available in the current compiler. Otherwise, the default (void *) cast
is
Implemented use of the C99 uintptr_t for the pointer casting macros if it is
*available in the current compiler. Otherwise, the default (void *) cast is*
used as before.

Fixed some possible memory leaks found within the execution path of the
Break, Continue, If, and CreateField operators. (Valery Podrezov)

Fixed a problem introduced in the 20051202 release where an exception is
generated during method execution if a control method attempts to declare
another method.

Moved resource descriptor string constants that are used by both the AML
disassembler and AML debugger to the common utilities directory so that
these components are independent.

Implemented support in the AcpiExec utility (-e switch) to globally
ignore
Implemented support in the AcpiExec utility (-e switch) to globally ignore
exceptions during control method execution (method is not aborted.)

Added the rsinfo.c source file to the AcpiExec makefile for Linux/Unix
generation.

Code and Data Size: The current and previous library sizes for the core
subsystem are shown below. These are the code and data sizes for the
acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.

2) iASL Compiler/Disassembler:

Fixed a problem where a CPU stack overflow fault could occur if a
recursive

Fixed a problem where a CPU stack overflow fault could occur if a recursive
method call was made from within a Return statement.

---
02 December 2005. Summary of changes for version 20051202:

1) ACPI CA Core Subsystem:

Modified the parsing of control methods to no longer create namespace
objects during the first pass of the parse. Objects are now created only
during the execute phase, at the moment the namespace creation operator
is
encountered in the AML (Name, OperationRegion, CreateByteField, etc.)
This
during the execute phase, at the moment the namespace creation operator is
encountered in the AML (Name, OperationRegion, CreateByteField, etc.) This
should eliminate ALREADY_EXISTS exceptions seen on some machines where
reentrant control methods are protected by an AML mutex. The mutex will
now
correctly block multiple threads from attempting to create the same
object
reentrant control methods are protected by an AML mutex. The mutex will now
correctly block multiple threads from attempting to create the same object
more than once.

Increased the number of available Owner Ids for namespace object tracking
from 32 to 255. This should eliminate the OWNER_ID_LIMIT exceptions seen
on
some machines with a large number of ACPI tables (either static or
dynamic).
from 32 to 255. This should eliminate the OWNER_ID_LIMIT exceptions seen on
some machines with a large number of ACPI tables (either static or dynamic).

Fixed a problem with the AcpiExec utility where a fault could occur when
the
Fixed a problem with the AcpiExec utility where a fault could occur when the
-b switch (batch mode) is used.

Enhanced the namespace dump routine to output the owner ID for each
namespace object.

2) iASL Compiler/Disassembler:

Fixed a parse error during compilation of certain Switch/Case constructs.

To
simplify the parse, the grammar now allows for multiple Default
statements
Fixed a parse error during compilation of certain Switch/Case constructs. To
simplify the parse, the grammar now allows for multiple Default statements
and this error is now detected and flagged during the analysis phase.

Disassembler: The disassembly now includes the contents of the original
table header within a comment at the start of the file. This includes the
name and version of the original ASL compiler.

---
17 November 2005. Summary of changes for version 20051117:

1) ACPI CA Core Subsystem:

Fixed a problem in the AML parser where the method thread count could be
decremented below zero if any errors occurred during the method parse
phase.
This should eliminate AE_AML_METHOD_LIMIT exceptions seen on some
machines.
decremented below zero if any errors occurred during the method parse phase.
This should eliminate AE_AML_METHOD_LIMIT exceptions seen on some machines.
This also fixed a related regression with the mechanism that detects and
corrects methods that cannot properly handle reentrancy (related to the
deployment of the new OwnerId mechanism.)

Eliminated the pre-parsing of control methods (to detect errors) during
table load. Related to the problem above, this was causing unwind issues
if
any errors occurred during the parse, and it seemed to be overkill. A
table
table load. Related to the problem above, this was causing unwind issues if
any errors occurred during the parse, and it seemed to be overkill. A table
load should not be aborted if there are problems with any single control
method, thus rendering this feature rather pointless.

Fixed a problem with the new table-driven resource manager where an
internal
Fixed a problem with the new table-driven resource manager where an internal
buffer overflow could occur for small resource templates.

Implemented a new external interface, AcpiGetVendorResource. This
interface
will find and return a vendor-defined resource descriptor within a _CRS
or
_PRS method via an ACPI 3.0 UUID match. With assistance from Bjorn
Helgaas.
Implemented a new external interface, AcpiGetVendorResource. This interface
will find and return a vendor-defined resource descriptor within a _CRS or
_PRS method via an ACPI 3.0 UUID match. With assistance from Bjorn Helgaas.

Removed the length limit (200) on string objects as per the upcoming ACPI
3.0A specification. This affects the following areas of the interpreter:
1)
any implicit conversion of a Buffer to a String, 2) a String object
result
3.0A specification. This affects the following areas of the interpreter: 1)
any implicit conversion of a Buffer to a String, 2) a String object result
of the ASL Concatentate operator, 3) the String object result of the ASL
ToString operator.

Fixed a problem in the Windows OS interface layer (OSL) where a
WAIT_FOREVER
Fixed a problem in the Windows OS interface layer (OSL) where a WAIT_FOREVER
on a semaphore object would incorrectly timeout. This allows the

multithreading features of the AcpiExec utility to work properly under Windows.

Updated the Linux makefiles for the iASL compiler and AcpiExec to include the recently added file named "utresrc.c".

Code and Data Size: The current and previous library sizes for the core subsystem are shown below. These are the code and data sizes for the **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These values do not include any ACPI driver or OSPM code. ```

2) iASL Compiler/Disassembler:

Fixed a problem with very large initializer lists (more than 4000 elements) *Fixed a problem with very large initializer lists (more than 4000 elements)* for both Buffer and Package objects where the parse stack could overflow.

Enhanced the pre-compile source code scan for non-ASCII characters to ignore characters within comment fields. The scan is now always performed and is no *Enhanced the pre-compile source code scan for non-ASCII characters to ignore characters within comment fields. The scan is now always performed and is no* longer optional, detecting invalid characters within a source file immediately rather than during the parse phase or later.

Enhanced the ASL grammar definition to force early reductions on all list- *Enhanced the ASL grammar definition to force early reductions on all list-*

style grammar elements so that the overall parse stack usage is greatly reduced. This should improve performance and reduce the possibility of parse
reduced. This should improve performance and reduce the possibility of parse
stack overflow.

Eliminated all reduce/reduce conflicts in the iASL parser generation. Also,
Eliminated all reduce/reduce conflicts in the iASL parser generation. Also,
with the addition of a %expected statement, the compiler generates from source with no warnings.

Fixed a possible segment fault in the disassembler if the input filename does not contain a "dot" extension (Thomas Renninger).

---
21 October 2005. Summary of changes for version 20051021:

1) ACPI CA Core Subsystem:

Implemented support for the EM64T and other x86-64 processors. This essentially entails recognizing that these processors support non-aligned memory transfers. Previously, all 64-bit processors were assumed to lack hardware support for non-aligned transfers.

Completed conversion of the Resource Manager to nearly full table-driven operation. Specifically, the resource conversion code (convert AML to internal format and the reverse) and the debug code to dump internal **resource descriptors are fully table-driven, reducing code and data size and**
resource descriptors are fully table-driven, reducing code and data size and
improving maintainability.

The OSL interfaces for Acquire and Release Lock now use a 64-bit flag word on 64-bit processors instead of a fixed 32-bit word. (With assistance from
The OSL interfaces for Acquire and Release Lock now use a 64-bit flag word on 64-bit processors instead of a fixed 32-bit word. (With assistance from
Alexey Starikovskiy)

Implemented support within the resource conversion code for the Type-Specific byte within the various ACPI 3.0 *WordSpace macros.

Fixed some issues within the resource conversion code for the type-specific
Fixed some issues within the resource conversion code for the type-specific
flags for both Memory and I/O address resource descriptors. For Memory, implemented support for the MTP and TTP flags. For I/O, split the TRS and TTP flags into two separate fields.

Code and Data Size: The current and previous library sizes for the core subsystem are shown below. These are the code and data sizes for the **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These values do not include any ACPI driver or OSPM code. The debug version of the**

the modified code created a resource template with a different size than the original, breaking code that used fixed offsets into the resource template
buffer.

Removed a recent feature of the disassembler to ignore a lone ResourceIndex
Removed a recent feature of the disassembler to ignore a lone ResourceIndex
byte. This byte is now emitted if present so that the exact AML can be reproduced when the disassembled code is recompiled.

Improved comments and text alignment for the resource descriptor code emitted by the disassembler.

Implemented disassembler support for the ACPI 3.0 AccessSize field within a
Implemented disassembler support for the ACPI 3.0 AccessSize field within a
Register() resource descriptor.

---
30 September 2005. Summary of changes for version 20050930:

1) ACPI CA Core Subsystem:

Completed a major overhaul of the Resource Manager code - specifically, **optimizations in the area of the AML/internal resource conversion code. The code has been optimized to simplify and eliminate duplicated code, CPU stack**
optimizations in the area of the AML/internal resource conversion code. The code has been optimized to simplify and eliminate duplicated code, CPU stack
use has been decreased by optimizing function parameters and local **variables, and naming conventions across the manager have been standardized**
variables, and naming conventions across the manager have been standardized
for clarity and ease of maintenance (this includes function, parameter, variable, and struct/typedef names.) The update may force changes in some driver code, depending on how resources are handled by the host OS.

All Resource Manager dispatch and information tables have been moved to a single location for clarity and ease of maintenance. One new file was created, named "rsinfo.c".

The ACPI return macros (return_ACPI_STATUS, etc.) have been modified to

guarantee that the argument is not evaluated twice, making them less prone
guarantee that the argument is not evaluated twice, making them less prone to macro side-effects. However, since there exists the possibility of **additional stack use if a particular compiler cannot optimize them (such as in the debug generation case), the original macros are optionally available.**
additional stack use if a particular compiler cannot optimize them (such as in the debug generation case), the original macros are optionally available. Note that some invocations of the return_VALUE macro may now cause size **mismatch warnings; the return_UINT8 and return_UINT32 macros are provided to**
mismatch warnings; the return_UINT8 and return_UINT32 macros are provided to eliminate these. (From Randy Dunlap)

Implemented a new mechanism to enable debug tracing for individual control
Implemented a new mechanism to enable debug tracing for individual control methods. A new external interface, AcpiDebugTrace, is provided to enable this mechanism. The intent is to allow the host OS to easily enable and disable tracing for problematic control methods. This interface can be easily exposed to a user or debugger interface if desired. See the file psxface.c for details.

AcpiUtCallocate will now return a valid pointer if a length of zero is specified - a length of one is used and a warning is issued. This matches the behavior of AcpiUtAllocate.

Code and Data Size: The current and previous library sizes for the core subsystem are shown below. These are the code and data sizes for the **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These values do not include any ACPI driver or OSPM code. The debug version of the**

    Debug Version:     168.1K Code, 68.4K Data, 236.5K Total
```

2) iASL Compiler/Disassembler:

Updated the disassembler to automatically insert an EndDependentFn() macro
Updated the disassembler to automatically insert an EndDependentFn() macro into the ASL stream if this macro is missing in the original AML code, simplifying compilation of the resulting ASL module.

Fixed a problem in the disassembler where a disassembled ResourceSource **string (within a large resource descriptor) was not surrounded by quotes and**
string (within a large resource descriptor) was not surrounded by quotes and not followed by a comma, causing errors when the resulting ASL module was compiled. Also, escape sequences within a ResourceSource string are now handled correctly (especially "\\")

---

02 September 2005. Summary of changes for version 20050902:

1) ACPI CA Core Subsystem:

Fixed a problem with the internal Owner ID allocation and deallocation mechanisms for control method execution and recursive method invocation. This should eliminate the OWNER_ID_LIMIT exceptions and "Invalid OwnerId" messages seen on some systems. Recursive method invocation depth is currently limited to 255. (Alexey Starikovskiy)

Completely eliminated all vestiges of support for the "module-level **executable code" until this support is fully implemented and debugged. This**

executable code" until this support is fully implemented and debugged. This should eliminate the NO_RETURN_VALUE exceptions seen during table load on some systems that invoke this support.

Fixed a problem within the resource manager code where the transaction flags
Fixed a problem within the resource manager code where the transaction flags for a 64-bit address descriptor were handled incorrectly in the type-specific flag byte.

Consolidated duplicate code within the address descriptor resource manager
Consolidated duplicate code within the address descriptor resource manager code, reducing overall subsystem code size.

Fixed a fault when using the AML debugger "disassemble" command to disassemble individual control methods.

Removed references to the "release_current" directory within the Unix release package.

Code and Data Size: The current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler. These values do not **include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler** and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  78.6K Code, 11.7K Data,  90.3K Total
    Debug Version:     170.0K Code, 69.9K Data, 239.9K Total

2) iASL Compiler/Disassembler:

Fixed a regression that appeared in the 20050708 version of the compiler
where an error message was inadvertently emitted for invocations of the
_OSI
where an error message was inadvertently emitted for invocations of the _OSI
reserved control method.

---
08 July 2005. Summary of changes for version 20050708:

1) ACPI CA Core Subsystem:

The use of the CPU stack in the debug version of the subsystem has been
considerably reduced. Previously, a debug structure was declared in every
function that used the debug macros. This structure has been removed in
favor of declaring the individual elements as parameters to the debug
functions. This reduces the cumulative stack use during nested execution
of
ACPI function calls at the cost of a small increase in the code size of
the
debug version of the subsystem. With assistance from Alexey Starikovskiy
and
functions. This reduces the cumulative stack use during nested execution of
ACPI function calls at the cost of a small increase in the code size of the
debug version of the subsystem. With assistance from Alexey Starikovskiy and
Len Brown.

Added the ACPI_GET_FUNCTION_NAME macro to enable the compiler-dependent
headers to define a macro that will return the current function name at
runtime (such as __FUNCTION__ or _func_, etc.) The function name is used
by
runtime (such as __FUNCTION__ or _func_, etc.) The function name is used by
the debug trace output. If ACPI_GET_FUNCTION_NAME is not defined in the
compiler-dependent header, the function name is saved on the CPU stack
(one
compiler-dependent header, the function name is saved on the CPU stack (one
pointer per function.) This mechanism is used because apparently there
exists no standard ANSI-C defined macro that that returns the function
name.
exists no standard ANSI-C defined macro that that returns the function name.

Redesigned and reimplemented the "Owner ID" mechanism used to track
namespace objects created/deleted by ACPI tables and control method
execution. A bitmap is now used to allocate and free the IDs, thus
solving
the wraparound problem present in the previous implementation. The size
of
execution. A bitmap is now used to allocate and free the IDs, thus solving
the wraparound problem present in the previous implementation. The size of
the namespace node descriptor was reduced by 2 bytes as a result (Alexey
Starikovskiy).

Removed the UINT32_BIT and UINT16_BIT types that were used for the
bitfield
Removed the UINT32_BIT and UINT16_BIT types that were used for the bitfield
flag definitions within the headers for the predefined ACPI tables. These
have been replaced by UINT8_BIT in order to increase the code portability
of
have been replaced by UINT8_BIT in order to increase the code portability of
the subsystem. If the use of UINT8 remains a problem, we may be forced to
eliminate bitfields entirely because of a lack of portability.

Enhanced the performance of the AcpiUtUpdateObjectReference procedure.
This
is a frequently used function and this improvement increases the
performance
Enhanced the performance of the AcpiUtUpdateObjectReference procedure. This
is a frequently used function and this improvement increases the performance
of the entire subsystem (Alexey Starikovskiy).

Fixed several possible memory leaks and the inverse - premature object
deletion (Alexey Starikovskiy).

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced

by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler
and
debug output trace mechanism and has a much larger code and data size. Note

```

---

24 June 2005. Summary of changes for version 20050624:

1) ACPI CA Core Subsystem:

Modified the new OSL cache interfaces to use ACPI_CACHE_T as the type for
the host-defined cache object. This allows the OSL implementation to
define
the host-defined cache object. This allows the OSL implementation to define
and type this object in any manner desired, simplifying the OSL
implementation. For example, ACPI_CACHE_T is defined as kmem_cache_t for
Linux, and should be defined in the OS-specific header file for other
operating systems as required.

Changed the interface to AcpiOsAcquireObject to directly return the
requested object as the function return (instead of ACPI_STATUS.) This
change was made for performance reasons, since this is the purpose of the
interface in the first place. AcpiOsAcquireObject is now similar to the
AcpiOsAllocate interface.

Implemented a new AML debugger command named Businfo. This command
displays
information about all devices that have an associate _PRT object. The
_ADR,
Implemented a new AML debugger command named Businfo. This command displays
information about all devices that have an associate _PRT object. The _ADR,
_HID, _UID, and _CID are displayed for these devices.

Modified the initialization sequence in AcpiInitializeSubsystem to call
the
OSL interface AcpiOslInitialize first, before any local initialization.
This
Modified the initialization sequence in AcpiInitializeSubsystem to call the
OSL interface AcpiOslInitialize first, before any local initialization. This
change was required because the global initialization now calls OSL
interfaces.

Enhanced the Dump command to display the entire contents of Package
objects
Enhanced the Dump command to display the entire contents of Package objects
(including all sub-objects and their values.)

Restructured the code base to split some files because of size and/or
because the code logically belonged in a separate file. New files are
listed
below. All makefiles and project files included in the ACPI CA release
have
because the code logically belonged in a separate file. New files are listed
below. All makefiles and project files included in the ACPI CA release have

been updated.

```
    utilities/utcache.c           /* Local cache interfaces */
    utilities/utmutex.c           /* Local mutex support */
    utilities/utstate.c           /* State object support */
    interpreter/parser/psloop.c   /* Main AML parse loop */
```

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler
and
debug output trace mechanism and has a much larger code and data size. Note
that these values will vary depending on the efficiency of the compiler and
the compiler options used during generation.

Package
Fixed a regression introduced in version 20050513 where the use of a Package
object within a Case() statement caused a compile time exception. The
original behavior has been restored (a Match() operator is emitted.)

---

17 June 2005. Summary of changes for version 20050617:

1) ACPI CA Core Subsystem:

Moved the object cache operations into the OS interface layer (OSL) to
allow
Moved the object cache operations into the OS interface layer (OSL) to allow
the host OS to handle these operations if desired (for example, the Linux
OSL will invoke the slab allocator). This support is optional; the
compile
time define ACPI_USE_LOCAL_CACHE may be used to utilize the original
cache
OSL will invoke the slab allocator). This support is optional; the compile
time define ACPI_USE_LOCAL_CACHE may be used to utilize the original cache
code in the ACPI CA core. The new OSL interfaces are shown below. See
utalloc.c for an example implementation, and acpiosxf.h for the exact
interface definitions. With assistance from Alexey Starikovskiy.

```
    AcpiOsCreateCache
    AcpiOsDeleteCache
    AcpiOsPurgeCache
    AcpiOsAcquireObject
    AcpiOsReleaseObject
```

Modified the interfaces to AcpiOsAcquireLock and AcpiOsReleaseLock to
return
Modified the interfaces to AcpiOsAcquireLock and AcpiOsReleaseLock to return
and restore a flags parameter. This fits better with many OS lock models.
Note: the current execution state (interrupt handler or not) is no longer
passed to these interfaces. If necessary, the OSL must determine this

state
passed to these interfaces. If necessary, the OSL must determine this state
by itself, a simple and fast operation. With assistance from Alexey
Starikovskiy.

Fixed a problem in the ACPI table handling where a valid XSDT was assumed
present if the revision of the RSDP was 2 or greater. According to the
ACPI
present if the revision of the RSDP was 2 or greater. According to the ACPI
specification, the XSDT is optional in all cases, and the table manager
therefore now checks for both an RSDP >=2 and a valid XSDT pointer.
Otherwise, the RSDT pointer is used. Some ACPI 2.0 compliant BIOSs
contain
Otherwise, the RSDT pointer is used. Some ACPI 2.0 compliant BIOSs contain
only the RSDT.

Fixed a problem where compiling the reserved _OSI method would randomly (but
rarely) produce compile errors.

Enhanced the disassembler to emit compilable code in the face of
incorrect
Enhanced the disassembler to emit compilable code in the face of incorrect
AML resource descriptors. If the optional ResourceSourceIndex is present,
but the ResourceSource is not, do not emit the ResourceSourceIndex in the
disassembly. Otherwise, the resulting code cannot be compiled without
errors.

---
26 May 2005. Summary of changes for version 20050526:

1) ACPI CA Core Subsystem:

Implemented support to execute Type 1 and Type 2 AML opcodes appearing at
the module level (not within a control method.) These opcodes are
executed
exactly once at the time the table is loaded. This type of code was legal
up
until the release of ACPI 2.0B (2002) and is now supported within ACPI CA
in
order to provide backwards compatibility with earlier BIOS
implementations.
the module level (not within a control method.) These opcodes are executed
exactly once at the time the table is loaded. This type of code was legal up
until the release of ACPI 2.0B (2002) and is now supported within ACPI CA in
order to provide backwards compatibility with earlier BIOS implementations.
This eliminates the "Encountered executable code at module level" warning
that was previously generated upon detection of such code.

Fixed a problem in the interpreter where an AE_NOT_FOUND exception could
inadvertently be generated during the lookup of namespace objects in the
second pass parse of ACPI tables and control methods. It appears that
this
problem could occur during the resolution of forward references to
namespace
second pass parse of ACPI tables and control methods. It appears that this
problem could occur during the resolution of forward references to namespace
objects.

Added the ACPI_MUTEX_DEBUG #ifdef to the AcpiUtReleaseMutex function,
corresponding to the same #ifdef in the AcpiUtAcquireMutex function. This
allows the deadlock detection debug code to be compiled out in the normal
case, improving mutex performance (and overall subsystem performance)
considerably.

Implemented a handful of miscellaneous fixes for possible memory leaks on

error conditions and error handling control paths. These fixes were
suggested by FreeBSD and the Coverity Prevent source code analysis tool.

Added a check for a null RSDT pointer in AcpiGetFirmwareTable
(tbxfroot.c)
Added a check for a null RSDT pointer in AcpiGetFirmwareTable (tbxfroot.c)
to prevent a fault in this error case.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced

Fixed a problem with the Method operator ParameterTypes list handling
(ACPI
3.0). Previously, more than 2 types or 2 arguments generated a syntax
error.
Fixed a problem with the Method operator ParameterTypes list handling (ACPI
3.0). Previously, more than 2 types or 2 arguments generated a syntax error.
The actual underlying implementation of method argument typechecking is
still under development, however.

```
---------------------------------------
```
13 May 2005. Summary of changes for version 20050513:

1) ACPI CA Core Subsystem:

Implemented support for PCI Express root bridges -- added support for
device
Implemented support for PCI Express root bridges -- added support for device
PNP0A08 in the root bridge search within AcpiEvPciConfigRegionSetup.

The interpreter now automatically truncates incoming 64-bit constants to
32
bits if currently executing out of a 32-bit ACPI table (Revision < 2).
This
The interpreter now automatically truncates incoming 64-bit constants to 32
bits if currently executing out of a 32-bit ACPI table (Revision < 2). This
also affects the iASL compiler constant folding. (Note: as per below, the
iASL compiler no longer allows 64-bit constants within 32-bit tables.)

Fixed a problem where string and buffer objects with "static" pointers
(pointers to initialization data within an ACPI table) were not handled
consistently. The internal object copy operation now always copies the
data
consistently. The internal object copy operation now always copies the data
to a newly allocated buffer, regardless of whether the source object is
static or not.

Fixed a problem with the FromBCD operator where an implicit result
conversion was improperly performed while storing the result to the
target
conversion was improperly performed while storing the result to the target
operand. Since this is an "explicit conversion" operator, the implicit
conversion should never be performed on the output.

Fixed a problem with the CopyObject operator where a copy to an existing
named object did not always completely overwrite the existing object
stored
at name. Specifically, a buffer-to-buffer copy did not delete the
existing
named object did not always completely overwrite the existing object stored
at name. Specifically, a buffer-to-buffer copy did not delete the existing
buffer.

Replaced "InterruptLevel" with "InterruptNumber" in all GPE interfaces
and
Replaced "InterruptLevel" with "InterruptNumber" in all GPE interfaces and
structs for consistency.

Code and Data Size: Current and previous core subsystem library sizes are

8715 2) iASL Compiler/Disassembler:

8717 The compiler now emits a warning if an attempt is made to generate a 64-
8718 bit
8719 integer constant from within a 32-bit ACPI table (Revision < 2). The
8720 integer
5024 The compiler now emits a warning if an attempt is made to generate a 64-bit
5025 integer constant from within a 32-bit ACPI table (Revision < 2). The integer
8721 is truncated to 32 bits.

8723 Fixed a problem with large package objects: if the static length of the
8724 package is greater than 255, the "variable length package" opcode is
8725 emitted. Previously, this caused an error. This requires an update to the
8726 ACPI spec, since it currently (incorrectly) states that packages larger
8727 than
5031 ACPI spec, since it currently (incorrectly) states that packages larger than
8728 255 elements are not allowed.

8730 The disassembler now correctly handles variable length packages and
8731 packages
5034 The disassembler now correctly handles variable length packages and packages
8732 larger than 255 elements.

8734 ----------------------------------------
8735 08 April 2005.  Summary of changes for version 20050408:

8737 1) ACPI CA Core Subsystem:

8739 Fixed three cases in the interpreter where an "index" argument to an ASL
8740 function was still (internally) 32 bits instead of the required 64 bits.
8741 This was the Index argument to the Index, Mid, and Match operators.

8743 The "strupr" function is now permanently local (AcpiUtStrupr), since this
8744 is
5046 The "strupr" function is now permanently local (AcpiUtStrupr), since this is
8745 not a POSIX-defined function and not present in most kernel-level C
8746 libraries. All references to the C library strupr function have been
8747 removed
5048 libraries. All references to the C library strupr function have been removed
8748 from the headers.

8750 Completed the deployment of static functions/prototypes. All prototypes
8751 with
8752 the static attribute have been moved from the headers to the owning C
8753 file.
5051 Completed the deployment of static functions/prototypes. All prototypes with
5052 the static attribute have been moved from the headers to the owning C file.

8755 Implemented an extract option (-e) for the AcpiBin utility (AML binary
8756 utility). This option allows the utility to extract individual ACPI
8757 tables
5055 utility). This option allows the utility to extract individual ACPI tables
8758 from the output of AcpiDmp. It provides the same functionality of the
8759 acpixtract.pl perl script without the worry of setting the correct perl
8760 options. AcpiBin runs on Windows and has not yet been generated/validated
8761 in
5058 options. AcpiBin runs on Windows and has not yet been generated/validated in
8762 the Linux/Unix environment (but should be soon).
8763
8764 Updated and fixed the table dump option for AcpiBin (-d). This option
8765 converts a single ACPI table to a hex/ascii file, similar to the output
8766 of
```

```
5062 converts a single ACPI table to a hex/ascii file, similar to the output of
8767 AcpiDmp.

8769 Code and Data Size: Current and previous core subsystem library sizes are
8770 shown below. These are the code and data sizes for the acpica.lib
8771 produced

8785     Debug Version:     163.7K Code, 69.3K Data, 233.0K Total

8788 2) iASL Compiler/Disassembler:

8790 Disassembler fix: Added a check to ensure that the table length found in
8791 the
8792 ACPI table header within the input file is not longer than the actual
8793 input
5083 Disassembler fix: Added a check to ensure that the table length found in the
5084 ACPI table header within the input file is not longer than the actual input
8794 file size. This indicates some kind of file or table corruption.

8796 ----------------------------------------
8797 29 March 2005.  Summary of changes for version 20050329:

8799 1) ACPI CA Core Subsystem:

8801 An error is now generated if an attempt is made to create a Buffer Field
8802 of
5092 An error is now generated if an attempt is made to create a Buffer Field of
8803 length zero (A CreateField with a length operand of zero.)

8805 The interpreter now issues a warning whenever executable code at the
8806 module
5095 The interpreter now issues a warning whenever executable code at the module
8807 level is detected during ACPI table load. This will give some idea of the
8808 prevalence of this type of code.

8810 Implemented support for references to named objects (other than control
8811 methods) within package objects.

8813 Enhanced package object output for the debug object. Package objects are
8814 now
5102 Enhanced package object output for the debug object. Package objects are now
8815 completely dumped, showing all elements.

8817 Enhanced miscellaneous object output for the debug object. Any object can
8818 now be written to the debug object (for example, a device object can be
8819 written, and the type of the object will be displayed.)

8821 The "static" qualifier has been added to all local functions across both
8822 the
5109 The "static" qualifier has been added to all local functions across both the
```

core subsystem and the iASL compiler.

The number of "long" lines (> 80 chars) within the source has been significantly reduced, by about 1/3.

Cleaned up all header files to ensure that all CA/iASL functions are prototyped (even static functions) and the formatting is consistent.

Two new header files have been added, acopcode.h and acnames.h.

Removed several obsolete functions that were no longer used.

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  78.3K Code, 11.5K Data,  89.8K Total
    Debug Version:     165.4K Code, 69.7K Data, 236.1K Total
  Current Release:
    Non-Debug Version:  78.0K Code, 11.6K Data,  89.6K Total
    Debug Version:     163.5K Code, 69.3K Data, 232.8K Total
```

2) iASL Compiler/Disassembler:

Fixed a problem with the resource descriptor generation/support. For the ResourceSourceIndex and the ResourceSource fields, both must be present, or both must be not present - can't have one without the other.

The compiler now returns non-zero from the main procedure if any errors have occurred during the compilation.

---

09 March 2005. Summary of changes for version 20050309:

1) ACPI CA Core Subsystem:

The string-to-buffer implicit conversion code has been modified again after a change to the ACPI specification. In order to match the behavior of the other major ACPI implementation, the target buffer is no longer truncated if the source string is smaller than an existing target buffer. This change requires an update to the ACPI spec, and should eliminate the recent AE_AML_BUFFER_LIMIT issues.

The "implicit return" support was rewritten to a new algorithm that solves the general case. Rather than attempt to determine when a method is about to exit, the result of every ASL operator is saved momentarily until the very next ASL operator is executed. Therefore, no matter how the method exits, there will always be a saved implicit return value. This feature is only enabled with the AcpiGbl_EnableInterpreterSlack flag, and should eliminate AE_AML_NO_RETURN_VALUE errors when enabled.

Implemented implicit conversion support for the predicate (operand) of the If, Else, and While operators. String and Buffer arguments are automatically converted to Integers.

Changed the string-to-integer conversion behavior to match the new ACPI errata: "If no integer object exists, a new integer is created. The ASCII string is interpreted as a hexadecimal constant. Each string character is interpreted as a hexadecimal value ('0'-'9', 'A'-'F', 'a', 'f'), starting with the first character as the most significant digit, and ending with the first non-hexadecimal character or end-of-string." This means that the first non-hex character terminates the conversion and this is the code that was changed.

Fixed a problem where the ObjectType operator would fail (fault) when used on an Index of a Package which pointed to a null package element. The operator now properly returns zero (Uninitialized) in this case.

Fixed a problem where the While operator used excessive memory by not properly popping the result stack during execution. There was no memory leak after execution, however. (Code provided by Valery Podrezov.)

Fixed a problem where references to control methods within Package objects caused the method to be invoked, instead of producing a reference object pointing to the method.

Restructured and simplified the pswalk.c module (AcpiPsDeleteParseTree) to improve performance and reduce code size. (Code provided by Alexey Starikovskiy.)

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced

by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler
and
debug output trace mechanism and has a much larger code and data size. Note
that these values will vary depending on the efficiency of the compiler and
the compiler options used during generation.

```

    Non-Debug Version:  78.3K Code, 11.5K Data,  89.8K Total
    Debug Version:     165.4K Code, 69.6K Data, 236.0K Total
  Current Release:
    Non-Debug Version:  78.3K Code, 11.5K Data,  89.8K Total
    Debug Version:     165.4K Code, 69.7K Data, 236.1K Total
```

2) iASL Compiler/Disassembler:

Fixed a problem with the Return operator with no arguments. Since the AML
grammar for the byte encoding requires an operand for the Return opcode,
the
grammar for the byte encoding requires an operand for the Return opcode, the
compiler now emits a Return(Zero) for this case. An ACPI specification
update has been written for this case.

For tables other than the DSDT, namepath optimization is automatically
disabled. This is because SSDTs can be loaded anywhere in the namespace,
the
disabled. This is because SSDTs can be loaded anywhere in the namespace, the
compiler has no knowledge of where, and thus cannot optimize namepaths.

Added "ProcessorObj" to the ObjectTypeKeyword list. This object type was
inadvertently omitted from the ACPI specification, and will require an
update to the spec.

The source file scan for ASCII characters is now optional (-a). This
change
The source file scan for ASCII characters is now optional (-a). This change
was made because some vendors place non-ascii characters within comments.
However, the scan is simply a brute-force byte compare to ensure all
characters in the file are in the range 0x00 to 0x7F.

Fixed a problem with the CondRefOf operator where the compiler was
inappropriately checking for the existence of the target. Since the point
of
inappropriately checking for the existence of the target. Since the point of
the operator is to check for the existence of the target at run-time, the
compiler no longer checks for the target existence.

Fixed a problem where errors generated from the internal AML interpreter
during constant folding were not handled properly, causing a fault.

Fixed a problem with overly aggressive range checking for the Stall
operator. The valid range (max 255) is now only checked if the operand is
of
operator. The valid range (max 255) is now only checked if the operand is of
type Integer. All other operand types cannot be statically checked.

Fixed a problem where control method references within the RefOf,
DeRefOf,
and ObjectType operators were not treated properly. They are now treated
as
Fixed a problem where control method references within the RefOf, DeRefOf,
and ObjectType operators were not treated properly. They are now treated as

actual references, not method invocations.

Fixed and enhanced the "list namespace" option (-ln). This option was
broken
Fixed and enhanced the "list namespace" option (-ln). This option was broken
a number of releases ago.

Improved error handling for the Field, IndexField, and BankField
operators.
Improved error handling for the Field, IndexField, and BankField operators.
The compiler now cleanly reports and recovers from errors in the field
component (FieldUnit) list.

Fixed a disassembler problem where the optional ResourceDescriptor fields
TRS and TTP were not always handled correctly.

Disassembler - Comments in output now use "//" instead of "/*"

```
---------------------------------------
```

28 February 2005. Summary of changes for version 20050228:

1) ACPI CA Core Subsystem:

Fixed a problem where the result of an Index() operator (an object
reference) must increment the reference count on the target object for
the
reference) must increment the reference count on the target object for the
life of the object reference.

Implemented AML Interpreter and Debugger support for the new ACPI 3.0
Extended Address (IO, Memory, Space), QwordSpace, DwordSpace, and
WordSpace
Extended Address (IO, Memory, Space), QwordSpace, DwordSpace, and WordSpace
resource descriptors.

Implemented support in the _OSI method for the ACPI 3.0 "Extended Address
Space Descriptor" string, indicating interpreter support for the
descriptors
Space Descriptor" string, indicating interpreter support for the descriptors
above.

Implemented header support for the new ACPI 3.0 FADT flag bits.

Implemented header support for the new ACPI 3.0 PCI Express bits for the
PM1
Implemented header support for the new ACPI 3.0 PCI Express bits for the PM1
status/enable registers.

Updated header support for the MADT processor local Apic struct and MADT
platform interrupt source struct for new ACPI 3.0 fields.

Implemented header support for the SRAT and SLIT ACPI tables.

Implemented the -s switch in AcpiExec to enable the "InterpreterSlack"
flag
Implemented the -s switch in AcpiExec to enable the "InterpreterSlack" flag
at runtime.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note

that these values will vary depending on the efficiency of the compiler and debug output trace mechanism and has a much larger code and data size. Note the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  78.2K Code, 11.5K Data,  89.7K Total
    Debug Version:     164.9K Code, 69.2K Data, 234.1K Total
  Current Release:
    Non-Debug Version:  78.3K Code, 11.5K Data,  89.8K Total
    Debug Version:     165.4K Code, 69.6K Data, 236.0K Total
```

2) iASL Compiler/Disassembler:

Fixed a problem with the internal 64-bit String-to-integer conversion with strings less than two characters long.

Fixed a problem with constant folding where the result of the Index() operator can not be considered a constant. This means that Index() cannot be a type3 opcode and this will require an update to the ACPI specification.

Disassembler: Implemented support for the TTP, MTP, and TRS resource descriptor fields. These fields were inadvertently ignored and not output in the disassembly of the resource descriptor.

---

11 February 2005. Summary of changes for version 20050211:

1) ACPI CA Core Subsystem:

Implemented ACPI 3.0 support for implicit conversion within the Match() operator. MatchObjects can now be of type integer, buffer, or string instead of just type integer. Package elements are implicitly converted to the type of the MatchObject. This change aligns the behavior of Match() with the behavior of the other logical operators (LLess(), etc.) It also requires an errata change to the ACPI specification as this support was intended for ACPI 3.0, but was inadvertently omitted.

Fixed a problem with the internal implicit "to buffer" conversion. Strings that are converted to buffers will cause buffer truncation if the string is smaller than the target buffer. Integers that are converted to buffers will not cause buffer truncation, only zero extension (both as per the ACPI spec.) The problem was introduced when code was added to truncate the buffer, but this should not be performed in all cases, only the string case.

buffer, but this should not be performed in all cases, only the string case.

Fixed a problem with the Buffer and Package operators where the interpreter would get confused if two such operators were used as operands to an ASL operator (such as LLess(Buffer(1){0},Buffer(1){1}). The internal result stack was not being popped after the execution of these operators, resulting in an AE_NO_RETURN_VALUE exception.

Fixed a problem with constructs of the form Store(Index(...),...). The reference object returned from Index was inadvertently resolved to an actual value. This problem was introduced in version 20050114 when the behavior of Store() was modified to restrict the object types that can be used as the source operand (to match the ACPI specification.)

Reduced excessive stack use within the AcpiGetObjectInfo procedure.

Added a fix to aclinux.h to allow generation of AcpiExec on Linux.

Updated the AcpiSrc utility to add the FADT_DESCRIPTOR_REV2_MINUS struct.

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  78.1K Code, 11.5K Data,  89.6K Total
    Debug Version:     164.8K Code, 69.2K Data, 234.0K Total
  Current Release:
    Non-Debug Version:  78.2K Code, 11.5K Data,  89.7K Total
    Debug Version:     164.9K Code, 69.2K Data, 234.1K Total
```

2) iASL Compiler/Disassembler:

Fixed a code generation problem in the constant folding optimization code where incorrect code was generated if a constant was reduced to a buffer object (i.e., a reduced type 5 opcode.)

Fixed a typechecking problem for the ToBuffer operator. Caused by an incorrect return type in the internal opcode information table.

---

25 January 2005. Summary of changes for version 20050125:

1) ACPI CA Core Subsystem:

Fixed a recently introduced problem with the Global Lock where the underlying semaphore was not created. This problem was introduced in

version 20050114, and caused an AE_AML_NO_OPERAND exception during an
Acquire() operation on _GL.

The local object cache is now optional, and is disabled by default. Both
AcpiExec and the iASL compiler enable the cache because they run in user
mode and this enhances their performance. #define
ACPI_ENABLE_OBJECT_CACHE
mode and this enhances their performance. #define ACPI_ENABLE_OBJECT_CACHE
to enable the local cache.

Fixed an issue in the internal function AcpiUtEvaluateObject concerning
the
optional "implicit return" support where an error was returned if no
return
object was expected, but one was implicitly returned. AE_OK is now
returned
Fixed an issue in the internal function AcpiUtEvaluateObject concerning the
optional "implicit return" support where an error was returned if no return
object was expected, but one was implicitly returned. AE_OK is now returned
in this case and the implicitly returned object is deleted.
AcpiUtEvaluateObject is only occasionally used, and only to execute
reserved
AcpiUtEvaluateObject is only occasionally used, and only to execute reserved
methods such as _STA and _INI where the return type is known up front.

Fixed a few issues with the internal convert-to-integer code. It now
returns
Fixed a few issues with the internal convert-to-integer code. It now returns
an error if an attempt is made to convert a null string, a string of only
blanks/tabs, or a zero-length buffer. This affects both implicit
conversion
blanks/tabs, or a zero-length buffer. This affects both implicit conversion
and explicit conversion via the ToInteger() operator.

The internal debug code in AcpiUtAcquireMutex has been commented out. It
is
not needed for normal operation and should increase the performance of
the
entire subsystem. The code remains in case it is needed for debug
purposes
The internal debug code in AcpiUtAcquireMutex has been commented out. It is
not needed for normal operation and should increase the performance of the
entire subsystem. The code remains in case it is needed for debug purposes
again.

```

2) iASL Compiler/Disassembler:

Switch/Case support: A warning is now issued if the type of the Switch
value
Switch/Case support: A warning is now issued if the type of the Switch value
cannot be determined at compile time. For example, Switch(Arg0) will
generate the warning, and the type is assumed to be an integer. As per
the
ACPI spec, use a construct such as Switch(ToInteger(Arg0)) to eliminate
the
generate the warning, and the type is assumed to be an integer. As per the
ACPI spec, use a construct such as Switch(ToInteger(Arg0)) to eliminate the
warning.

Switch/Case support: Implemented support for buffer and string objects as
the switch value. This is an ACPI 3.0 feature, now that LEqual supports
buffers and strings.

Switch/Case support: The emitted code for the LEqual() comparisons now
uses
the switch value as the first operand, not the second. The case value is
now
Switch/Case support: The emitted code for the LEqual() comparisons now uses
the switch value as the first operand, not the second. The case value is now
the second operand, and this allows the case value to be implicitly
converted to the type of the switch value, not the other way around.

Switch/Case support: Temporary variables are now emitted immediately
within
the control method, not at the global level. This means that there are
now
36 temps available per-method, not 36 temps per-module as was the case
with
Switch/Case support: Temporary variables are now emitted immediately within
the control method, not at the global level. This means that there are now
36 temps available per-method, not 36 temps per-module as was the case with
the earlier implementation (_T_0 through _T_9 and _T_A through _T_Z.)

```
----------------------------------------
```
14 January 2005. Summary of changes for version 20050114:

Added 2005 copyright to all module headers. This affects every module in
the core subsystem, iASL compiler, and the utilities.

1) ACPI CA Core Subsystem:

Fixed an issue with the String-to-Buffer conversion code where the string
null terminator was not included in the buffer after conversion, but
there
is existing ASL that assumes the string null terminator is included. This
is
null terminator was not included in the buffer after conversion, but there
is existing ASL that assumes the string null terminator is included. This is
the root of the ACPI_AML_BUFFER_LIMIT regression. This problem was
introduced in the previous version when the code was updated to correctly
set the converted buffer size as per the ACPI specification. The ACPI
spec
is ambiguous and will be updated to specify that the null terminator must
be
set the converted buffer size as per the ACPI specification. The ACPI spec
is ambiguous and will be updated to specify that the null terminator must be

included in the converted buffer. This also affects the ToBuffer() ASL operator.

Fixed a problem with the Mid() ASL/AML operator where it did not work correctly on Buffer objects. Newly created sub-buffers were not being marked as initialized.

Fixed a problem in AcpiTbFindTable where incorrect string compares were performed on the OemId and OemTableId table header fields. These fields are not null terminated, so strncmp is now used instead of strcmp.

Implemented a restriction on the Store() ASL/AML operator to align the behavior with the ACPI specification. Previously, any object could be used as the source operand. Now, the only objects that may be used are Integers, Buffers, Strings, Packages, Object References, and DDB Handles. If necessary, the original behavior can be restored by enabling the EnableInterpreterSlack flag.

Enhanced the optional "implicit return" support to allow an implicit return value from methods that are invoked externally via the AcpiEvaluateObject interface. This enables implicit returns from the _STA and _INI methods, for example.

Changed the Revision() ASL/AML operator to return the current version of the AML interpreter, in the YYYYMMDD format. Previously, it incorrectly returned the supported ACPI version (This is the function of the _REV method).

Updated the _REV predefined method to return the currently supported version of ACPI, now 3.

Implemented batch mode option for the AcpiExec utility (-b).

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```

---

10 December 2004. Summary of changes for version 20041210:

ACPI 3.0 support is nearing completion in both the iASL compiler and the ACPI CA core subsystem.

1) ACPI CA Core Subsystem:

Fixed a problem in the ToDecimalString operator where the resulting string length was incorrectly calculated. The length is now calculated exactly, eliminating incorrect AE_STRING_LIMIT exceptions.

Fixed a problem in the ToHexString operator to allow a maximum 200 character string to be produced.

Fixed a problem in the internal string-to-buffer and buffer-to-buffer copy routine where the length of the resulting buffer was not truncated to the new size (if the target buffer already existed).

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release:
    Non-Debug Version:  78.3K Code,  11.5K Data,   89.8K Total
    Debug Version:     164.7K Code,  68.5K Data,  233.2K Total
  Current Release:
    Non-Debug Version:  78.3K Code,  11.5K Data,   89.8K Total
    Debug Version:     165.3K Code,  69.4K Data,  234.7K Total
```

2) iASL Compiler/Disassembler:

Implemented the new ACPI 3.0 resource template macros - DWordSpace, ExtendedIO, ExtendedMemory, ExtendedSpace, QWordSpace, and WordSpace. Includes support in the disassembler.

Implemented support for the new (ACPI 3.0) parameter to the Register macro, AccessSize.

Fixed a problem where the _HE resource name for the Interrupt macro was referencing bit 0 instead of bit 1.

Implemented check for maximum 255 interrupts in the Interrupt macro.

Fixed a problem with the predefined resource descriptor names where
incorrect AML code was generated if the offset within the resource buffer
was 0 or 1. The optimizer shortened the AML code to a single byte opcode
but did not update the surrounding package lengths.

**Changes to the Dma macro: All channels within the channel list must be
in**
Changes to the Dma macro: All channels within the channel list must be in
the range 0-7. Maximum 8 channels can be specified. BusMaster operand is
optional (default is BusMaster).

Implemented check for maximum 7 data bytes for the VendorShort macro.

**The ReadWrite parameter is now optional for the Memory32 and similar
macros.**
The ReadWrite parameter is now optional for the Memory32 and similar macros.

---
03 December 2004. Summary of changes for version 20041203:

1) ACPI CA Core Subsystem:

**The low-level field insertion/extraction code (exfldio) has been
completely**
The low-level field insertion/extraction code (exfldio) has been completely
rewritten to eliminate unnecessary complexity, bugs, and boundary
conditions.

**Fixed a problem in the ToInteger, ToBuffer, ToHexString, and
ToDecimalString**
Fixed a problem in the ToInteger, ToBuffer, ToHexString, and ToDecimalString
operators where the input operand could be inadvertently deleted if no
conversion was necessary (e.g., if the input to ToInteger was an Integer
object.)

**Fixed a problem with the ToDecimalString and ToHexString where an
incorrect**
Fixed a problem with the ToDecimalString and ToHexString where an incorrect
exception code was returned if the resulting string would be > 200 chars.
AE_STRING_LIMIT is now returned.

Fixed a problem with the Concatenate operator where AE_OK was always
returned, even if the operation failed.

Fixed a problem in oswinxf (used by AcpiExec and iASL) to allow > 128
semaphores to be allocated.

Code and Data Size: Current and previous core subsystem library sizes are
**shown below. These are the code and data sizes for the acpica.lib
produced**

```

2) iASL Compiler/Disassembler:

Implemented support for all ACPI 3.0 reserved names and methods.

Implemented all ACPI 3.0 grammar elements in the front-end, including support for semicolons.

Implemented the ACPI 3.0 Function() and ToUUID() macros

Fixed a problem in the disassembler where a Scope() operator would not be emitted properly if the target of the scope was in another table.

---

15 October 2004. Summary of changes for version 20041015:

Note: ACPI CA is currently undergoing an in-depth and complete formal evaluation to test/verify the following areas. Other suggestions are welcome. This will result in an increase in the frequency of releases and the number of bug fixes in the next few months.
- Functional tests for all ASL/AML operators
- All implicit/explicit type conversions
- Bit fields and operation regions
- 64-bit math support and 32-bit-only "truncated" math support
- Exceptional conditions, both compiler and interpreter
- Dynamic object deletion and memory leaks
- ACPI 3.0 support when implemented
- External interfaces to the ACPI subsystem

1) ACPI CA Core Subsystem:

Fixed two alignment issues on 64-bit platforms - within debug statements in AcpiEvGpeDetect and AcpiEvCreateGpeBlock. Removed references to the Address
Fixed two alignment issues on 64-bit platforms - within debug statements in AcpiEvGpeDetect and AcpiEvCreateGpeBlock. Removed references to the Address field within the non-aligned ACPI generic address structure.

Fixed a problem in the Increment and Decrement operators where incorrect operand resolution could result in the inadvertent modification of the original integer when the integer is passed into another method as an argument and the arg is then incremented/decremented.

Fixed a problem in the FromBCD operator where the upper 32-bits of a 64-bit
Fixed a problem in the FromBCD operator where the upper 32-bits of a 64-bit BCD number were truncated during conversion.

Fixed a problem in the ToDecimal operator where the length of the resulting string could be set incorrectly too long if the input operand was a Buffer
Fixed a problem in the ToDecimal operator where the length of the resulting string could be set incorrectly too long if the input operand was a Buffer object.

Fixed a problem in the Logical operators (LLess, etc.) where a NULL byte (0)
Fixed a problem in the Logical operators (LLess, etc.) where a NULL byte (0) within a buffer would prematurely terminate a compare between buffer objects.

Added a check for string overflow (>200 characters as per the ACPI
specification) during the Concatenate operator with two string operands.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler
and
debug output trace mechanism and has a much larger code and data size. Note
that these values will vary depending on the efficiency of the compiler and
the compiler options used during generation.

    Debug Version:     164.6K Code,  68.5K Data,  233.1K Total
  Current Release:
    Non-Debug Version:  78.0K Code,  11.5K Data,   89.5K Total
    Debug Version:     164.8K Code,  68.6K Data,  233.4K Total
```

2) iASL Compiler/Disassembler:

Allow the use of the ObjectType operator on uninitialized Locals and Args
(returns 0 as per the ACPI specification).

Fixed a problem where the compiler would fault if there was a syntax
error
Fixed a problem where the compiler would fault if there was a syntax error
in the FieldName of all of the various CreateXXXField operators.

Disallow the use of lower case letters within the EISAID macro, as per
the
ACPI specification. All EISAID strings must be of the form "UUUNNNN"
Where
Disallow the use of lower case letters within the EISAID macro, as per the
ACPI specification. All EISAID strings must be of the form "UUUNNNN" Where
U is an uppercase letter and N is a hex digit.

---
06 October 2004. Summary of changes for version 20041006:

1) ACPI CA Core Subsystem:

Implemented support for the ACPI 3.0 Timer operator. This ASL function
implements a 64-bit timer with 100 nanosecond granularity.

Defined a new OSL interface, AcpiOsGetTimer. This interface is used to
implement the ACPI 3.0 Timer operator. This allows the host OS to
implement
the timer with the best clock available. Also, it keeps the core
subsystem
implement the ACPI 3.0 Timer operator. This allows the host OS to implement
the timer with the best clock available. Also, it keeps the core subsystem
out of the clock handling business, since the host OS (usually) performs
this function.

Fixed an alignment issue on 64-bit platforms. The HwLowLevelRead(Write)
functions use a 64-bit address which is part of the packed ACPI Generic
Address Structure. Since the structure is non-aligned, the alignment

macros
Address Structure. Since the structure is non-aligned, the alignment macros
are now used to extract the address to a local variable before use.

Fixed a problem where the ToInteger operator assumed all input strings
were
hexadecimal. The operator now handles both decimal strings and hex
strings
Fixed a problem where the ToInteger operator assumed all input strings were
hexadecimal. The operator now handles both decimal strings and hex strings
(prefixed with "0x").

Fixed a problem where the string length in the string object created as a
result of the internal ConvertToString procedure could be incorrect. This
potentially affected all implicit conversions and also the
ToDecimalString
potentially affected all implicit conversions and also the ToDecimalString
and ToHexString operators.

Fixed two problems in the ToString operator. If the length parameter was
zero, an incorrect string object was created and the value of the input
length parameter was inadvertently changed from zero to Ones.

Fixed a problem where the optional ResourceSource string in the
ExtendedIRQ
Fixed a problem where the optional ResourceSource string in the ExtendedIRQ
resource macro was ignored.

Simplified the interfaces to the internal division functions, reducing
code
Simplified the interfaces to the internal division functions, reducing code
size and complexity.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler

  Current Release:
    Non-Debug Version:  77.8K Code,  11.5K Data,   89.3K Total
    Debug Version:     164.6K Code,  68.5K Data,  233.1K Total
```

2) iASL Compiler/Disassembler:

Implemented support for the ACPI 3.0 Timer operator.

Fixed a problem where the Default() operator was inadvertently ignored in
a
Fixed a problem where the Default() operator was inadvertently ignored in a
Switch/Case block. This was a problem in the translation of the Switch
statement to If...Else pairs.

Added support to allow a standalone Return operator, with no parentheses

(or
Added support to allow a standalone Return operator, with no parentheses (or
operands).

Fixed a problem with code generation for the ElseIf operator where the
translated Else...If parse tree was improperly constructed leading to the
loss of some code.

---
22 September 2004. Summary of changes for version 20040922:

1) ACPI CA Core Subsystem:

Fixed a problem with the implementation of the LNot() operator where
"Ones"
was not returned for the TRUE case. Changed the code to return Ones
instead
of (!Arg) which was usually 1. This change affects iASL constant folding
for
Fixed a problem with the implementation of the LNot() operator where "Ones"
was not returned for the TRUE case. Changed the code to return Ones instead
of (!Arg) which was usually 1. This change affects iASL constant folding for
this operator also.

Fixed a problem in AcpiUtInitializeBuffer where an existing buffer was
not
Fixed a problem in AcpiUtInitializeBuffer where an existing buffer was not
initialized properly -- Now zero the entire buffer in this case where the
buffer already exists.

Changed the interface to AcpiOsSleep from (UINT32 Seconds, UINT32
Milliseconds) to simply (ACPI_INTEGER Milliseconds). This simplifies all
related code considerably. This will require changes/updates to all OS
interface layers (OSLs.)

Implemented a new external interface, AcpiInstallExceptionHandler, to
allow
a system exception handler to be installed. This handler is invoked upon
any
Implemented a new external interface, AcpiInstallExceptionHandler, to allow
a system exception handler to be installed. This handler is invoked upon any
run-time exception that occurs during control method execution.

Added support for the DSDT in AcpiTbFindTable. This allows the
DataTableRegion() operator to access the local copy of the DSDT.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced

    Debug Version:     164.2K Code,  68.2K Data,  232.4K Total
  Current Release:
    Non-Debug Version:  77.9K Code,  11.4K Data,   89.3K Total
    Debug Version:     164.5K Code,  68.3K Data,  232.8K Total
```

2) iASL Compiler/Disassembler:

Fixed a problem with constant folding and the LNot operator. LNot was
returning 1 in the TRUE case, not Ones as per the ACPI specification.
This
returning 1 in the TRUE case, not Ones as per the ACPI specification. This
could result in the generation of an incorrect folded/reduced constant.

End-Of-File is now allowed within a "//"-style comment. A parse error no
longer occurs if such a comment is at the very end of the input ASL
source
longer occurs if such a comment is at the very end of the input ASL source
file.

Implemented the "-r" option to override the Revision in the table header.
The initial use of this option will be to simplify the evaluation of the
AML
interpreter by allowing a single ASL source module to be compiled for
either
The initial use of this option will be to simplify the evaluation of the AML
interpreter by allowing a single ASL source module to be compiled for either
32-bit or 64-bit integers.

---
27 August 2004. Summary of changes for version 20040827:

1) ACPI CA Core Subsystem:

- Implemented support for implicit object conversion in the non-numeric
logical operators (LEqual, LGreater, LGreaterEqual, LLess, LLessEqual,
and
logical operators (LEqual, LGreater, LGreaterEqual, LLess, LLessEqual, and
LNotEqual.) Any combination of Integers/Strings/Buffers may now be used;
the second operand is implicitly converted on the fly to match the type
of
the second operand is implicitly converted on the fly to match the type of
the first operand. For example:

```
    LEqual (Source1, Source2)
```

Source1 and Source2 must each evaluate to an integer, a string, or a
buffer.
The data type of Source1 dictates the required type of Source2. Source2
is
Source1 and Source2 must each evaluate to an integer, a string, or a buffer.
The data type of Source1 dictates the required type of Source2. Source2 is
implicitly converted if necessary to match the type of Source1.

- Updated and corrected the behavior of the string conversion support.
The
- Updated and corrected the behavior of the string conversion support. The
rules concerning conversion of buffers to strings (according to the ACPI
specification) are as follows:

ToDecimalString - explicit byte-wise conversion of buffer to string of
decimal values (0-255) separated by commas. ToHexString - explicit byte-
wise
decimal values (0-255) separated by commas. ToHexString - explicit byte-wise
conversion of buffer to string of hex values (0-FF) separated by commas.
ToString - explicit byte-wise conversion of buffer to string. Byte-by-
byte
copy with no transform except NULL terminated. Any other implicit buffer-
to-

string conversion - byte-wise conversion of buffer to string of hex values
ToString - explicit byte-wise conversion of buffer to string. Byte-by-byte copy with no transform except NULL terminated. Any other implicit buffer-to-string conversion - byte-wise conversion of buffer to string of hex values (0-FF) separated by spaces.

- Fixed typo in definition of AcpiGbl_EnableInterpreterSlack.

- Fixed a problem in AcpiNsGetPathnameLength where the returned length was
- Fixed a problem in AcpiNsGetPathnameLength where the returned length was one byte too short in the case of a node in the root scope. This could cause a fault during debug output.

- Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced

```

2) iASL Compiler/Disassembler:

Fixed a problem where constants in ASL expressions at the root level (not within a control method) could be inadvertently truncated during code generation. This problem was introduced in the 20040715 release.

---
15 July 2004. Summary of changes for version 20040715:

1) ACPI CA Core Subsystem:

Restructured the internal HW GPE interfaces to pass/track the current state
Restructured the internal HW GPE interfaces to pass/track the current state of interrupts (enabled/disabled) in order to avoid possible deadlock and increase flexibility of the interfaces.

Implemented a "lexicographical compare" for String and Buffer objects within the logical operators -- LGreater, LLess, LGreaterEqual, and LLessEqual - as per further clarification to the ACPI specification. Behavior is similar
Implemented a "lexicographical compare" for String and Buffer objects within the logical operators -- LGreater, LLess, LGreaterEqual, and LLessEqual -- as per further clarification to the ACPI specification. Behavior is similar to C library "strcmp".

Completed a major reduction in CPU stack use for the AcpiGetFirmwareTable external function. In the 32-bit non-debug case, the stack use has been reduced from 168 bytes to 32 bytes.

Deployed a new run-time configuration flag, AcpiGbl_EnableInterpreterSlack,
Deployed a new run-time configuration flag, AcpiGbl_EnableInterpreterSlack, whose purpose is to allow the AML interpreter to forgive certain bad AML

constructs. Default setting is FALSE.

Implemented the first use of AcpiGbl_EnableInterpreterSlack in the Field IO
support code. If enabled, it allows field access to go beyond the end of a
region definition if the field is within the region length rounded up to the
Implemented the first use of AcpiGbl_EnableInterpreterSlack in the Field IO support code. If enabled, it allows field access to go beyond the end of a region definition if the field is within the region length rounded up to the
next access width boundary (a common coding error.)

Renamed OSD_HANDLER to ACPI_OSD_HANDLER, and OSD_EXECUTION_CALLBACK to
ACPI_OSD_EXEC_CALLBACK for consistency with other ACPI symbols. Also, these
ACPI_OSD_EXEC_CALLBACK for consistency with other ACPI symbols. Also, these
symbols are lowercased by the latest version of the AcpiSrc tool.

The prototypes for the PCI interfaces in acpiosxf.h have been updated to
rename "Register" to simply "Reg" to prevent certain compilers from
complaining.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include

27 May 2004. Summary of changes for version 20040527:

1) ACPI CA Core Subsystem:

Completed a new design and implementation for EBDA (Extended BIOS Data
Area)
support in the RSDP scan code. The original code improperly scanned for
the
EBDA by simply scanning from memory location 0 to 0x400. The correct
method
Completed a new design and implementation for EBDA (Extended BIOS Data Area)
support in the RSDP scan code. The original code improperly scanned for the
EBDA by simply scanning from memory location 0 to 0x400. The correct method
is to first obtain the EBDA pointer from within the BIOS data area, then
scan 1K of memory starting at the EBDA pointer. There appear to be few
if
scan 1K of memory starting at the EBDA pointer. There appear to be few if
any machines that place the RSDP in the EBDA, however.

Integrated a fix for a possible fault during evaluation of BufferField
arguments. Obsolete code that was causing the problem was removed.

Found and fixed a problem in the Field Support Code where data could be
corrupted on a bit field read that starts on an aligned boundary but does
not end on an aligned boundary. Merged the read/write "datum length"
calculation code into a common procedure.

Rolled in a couple of changes to the FreeBSD-specific header.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the

14 May 2004. Summary of changes for version 20040514:

1) ACPI CA Core Subsystem:

Fixed a problem where hardware GPE enable bits sometimes not set properly
during and after GPE method execution. Result of 04/27 changes.

Removed extra "clear all GPEs" when sleeping/waking.

Removed AcpiHwEnableGpe and AcpiHwDisableGpe, replaced by the single
AcpiHwWriteGpeEnableReg. Changed a couple of calls to the functions above
to
AcpiHwWriteGpeEnableReg. Changed a couple of calls to the functions above to
the new AcpiEv* calls as appropriate.

ACPI_OS_NAME was removed from the OS-specific headers. The default name
is
now "Microsoft Windows NT" for maximum compatibility. However this can
be
ACPI_OS_NAME was removed from the OS-specific headers. The default name is
now "Microsoft Windows NT" for maximum compatibility. However this can be
changed by modifying the acconfig.h file.

Allow a single invocation of AcpiInstallNotifyHandler for a handler that
traps both types of notifies (System, Device). Use ACPI_ALL_NOTIFY flag.

Run _INI methods on ThermalZone objects. This is against the ACPI
specification, but there is apparently ASL code in the field that has
these
specification, but there is apparently ASL code in the field that has these
_INI methods, and apparently "other" AML interpreters execute them.

Performed a full 16/32/64 bit lint that resulted in some small changes.

Added a sleep simulation command to the AML debugger to test sleep code.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code includes the
debug output trace mechanism and has a much larger code and data size.
Note
that these values will vary depending on the efficiency of the compiler

```

---
27 April 2004. Summary of changes for version 20040427:

1) ACPI CA Core Subsystem:

Completed a major overhaul of the GPE handling within ACPI CA. There are
now three types of GPEs: wake-only, runtime-only, and combination

wake/run.
now three types of GPEs: wake-only, runtime-only, and combination wake/run.
The only GPEs allowed to be combination wake/run are for button-style
devices such as a control-method power button, control-method sleep
button,
or a notebook lid switch. GPEs that have an _Lxx or _Exx method and are
not
devices such as a control-method power button, control-method sleep button,
or a notebook lid switch. GPEs that have an _Lxx or _Exx method and are not
referenced by any _PRW methods are marked for "runtime" and hardware
enabled. Any GPE that is referenced by a _PRW method is marked for
"wake"
enabled. Any GPE that is referenced by a _PRW method is marked for "wake"
(and disabled at runtime). However, at sleep time, only those GPEs that
have been specifically enabled for wake via the AcpiEnableGpe interface
will
have been specifically enabled for wake via the AcpiEnableGpe interface will
actually be hardware enabled.

A new external interface has been added, AcpiSetGpeType(), that is meant
to
be used by device drivers to force a GPE to a particular type. It will
be
A new external interface has been added, AcpiSetGpeType(), that is meant to
be used by device drivers to force a GPE to a particular type. It will be
especially useful for the drivers for the button devices mentioned above.

Completed restructuring of the ACPI CA initialization sequence so that
default operation region handlers are installed before GPEs are
initialized
and the _PRW methods are executed. This will prevent errors when the
_PRW
default operation region handlers are installed before GPEs are initialized
and the _PRW methods are executed. This will prevent errors when the _PRW
methods attempt to access system memory or I/O space.

GPE enable/disable no longer reads the GPE enable register. We now keep
the
GPE enable/disable no longer reads the GPE enable register. We now keep the
enable info for runtime and wake separate and in the GPE_EVENT_INFO. We
thus no longer depend on the hardware to maintain these bits.

Always clear the wake status and fixed/GPE status bits before sleep, even
for state S5.

Improved the AML debugger output for displaying the GPE blocks and their
current status.

Added new strings for the _OSI method, of the form "Windows 2001 SPx"
where
Added new strings for the _OSI method, of the form "Windows 2001 SPx" where
x = 0,1,2,3,4.

Fixed a problem where the physical address was incorrectly calculated
when
the Load() operator was used to directly load from an Operation Region
(vs.
loading from a Field object.) Also added check for minimum table length
for
Fixed a problem where the physical address was incorrectly calculated when
the Load() operator was used to directly load from an Operation Region (vs.
loading from a Field object.) Also added check for minimum table length for
this case.

Fix for multiple mutex acquisition. Restore original thread SyncLevel on
mutex release.

Added ACPI_VALID_SXDS flag to the AcpiGetObjectInfo interface for
consistency with the other fields returned.

Shrunk the ACPI_GPE_EVENT_INFO structure by 40%. There is one such
structure for each GPE in the system, so the size of this structure is
important.

CPU stack requirement reduction: Cleaned up the method execution and
object
CPU stack requirement reduction: Cleaned up the method execution and object
evaluation paths so that now a parameter structure is passed, instead of
copying the various method parameters over and over again.

In evregion.c: Correctly exit and reenter the interpreter region if and
only if dispatching an operation region request to a user-installed
handler.
only if dispatching an operation region request to a user-installed handler.
Do not exit/reenter when dispatching to a default handler (e.g., default
system memory or I/O handlers)

Notes for updating drivers for the new GPE support. The following
changes
must be made to ACPI-related device drivers that are attached to one or
more
GPEs: (This information will be added to the ACPI CA Programmer
Reference.)
Notes for updating drivers for the new GPE support. The following changes
must be made to ACPI-related device drivers that are attached to one or more
GPEs: (This information will be added to the ACPI CA Programmer Reference.)

1) AcpiInstallGpeHandler no longer automatically enables the GPE, you
must
1) AcpiInstallGpeHandler no longer automatically enables the GPE, you must
explicitly call AcpiEnableGpe.
2) There is a new interface called AcpiSetGpeType. This should be called
before enabling the GPE. Also, this interface will automatically disable
the GPE if it is currently enabled.
3) AcpiEnableGpe no longer supports a GPE type flag.

Specific drivers that must be changed:
1) EC driver:
    AcpiInstallGpeHandler (NULL, GpeNum, ACPI_GPE_EDGE_TRIGGERED,
AeGpeHandler, NULL);
    AcpiSetGpeType (NULL, GpeNum, ACPI_GPE_TYPE_RUNTIME);
    AcpiEnableGpe (NULL, GpeNum, ACPI_NOT_ISR);

2) Button Drivers (Power, Lid, Sleep):
Run _PRW method under parent device
If _PRW exists: /* This is a control-method button */
    Extract GPE number and possibly GpeDevice
    AcpiSetGpeType (GpeDevice, GpeNum, ACPI_GPE_TYPE_WAKE_RUN);
    AcpiEnableGpe (GpeDevice, GpeNum, ACPI_NOT_ISR);

For all other devices that have _PRWs, we automatically set the GPE type
to
ACPI_GPE_TYPE_WAKE, but the GPE is NOT automatically (wake) enabled.
This
must be done on a selective basis, usually requiring some kind of user
app
For all other devices that have _PRWs, we automatically set the GPE type to
ACPI_GPE_TYPE_WAKE, but the GPE is NOT automatically (wake) enabled. This
must be done on a selective basis, usually requiring some kind of user app
to allow the user to pick the wake devices.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced
shown below. These are the code and data sizes for the acpica.lib produced
by the Microsoft Visual C++ 6.0 compiler, and these values do not include

---

02 April 2004. Summary of changes for version 20040402:

1) ACPI CA Core Subsystem:

Fixed an interpreter problem where an indirect store through an ArgX
parameter was incorrectly applying the "implicit conversion rules" during
the store. From the ACPI specification: "If the target is a method local
or
the store. From the ACPI specification: "If the target is a method local or
argument (LocalX or ArgX), no conversion is performed and the result is
stored directly to the target". The new behavior is to disable implicit
conversion during ALL stores to an ArgX.

Changed the behavior of the _PRW method scan to ignore any and all errors
returned by a given _PRW. This prevents the scan from aborting from the
failure of any single _PRW.

Moved the runtime configuration parameters from the global init procedure
to
Moved the runtime configuration parameters from the global init procedure to
static variables in acglobal.h. This will allow the host to override the
default values easily.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced

hand editing.

---

26 March 2004. Summary of changes for version 20040326:

1) ACPI CA Core Subsystem:

Implemented support for "wake" GPEs via interaction between GPEs and the
_PRW methods. Every GPE that is pointed to by one or more _PRWs is
identified as a WAKE GPE and by default will no longer be enabled at
runtime. Previously, we were blindly enabling all GPEs with a
corresponding
_Lxx or _Exx method - but most of these turn out to be WAKE GPEs anyway.
We
runtime. Previously, we were blindly enabling all GPEs with a corresponding
_Lxx or _Exx method - but most of these turn out to be WAKE GPEs anyway. We
believe this has been the cause of thousands of "spurious" GPEs on some
systems.

This new GPE behavior is can be reverted to the original behavior (enable
ALL GPEs at runtime) via a runtime flag.

Fixed a problem where aliased control methods could not access objects
properly. The proper scope within the namespace was not initialized
(transferred to the target of the aliased method) before executing the
target method.

Fixed a potential race condition on internal object deletion on the
return
Fixed a potential race condition on internal object deletion on the return
object in AcpiEvaluateObject.

Integrated a fix for resource descriptors where both _MEM and _MTP were
being extracted instead of just _MEM. (i.e. bitmask was incorrectly too
wide, 0x0F instead of 0x03.)

Added a special case for ACPI_ROOT_OBJECT in AcpiUtGetNodeName,
preventing
a
Added a special case for ACPI_ROOT_OBJECT in AcpiUtGetNodeName, preventing a
fault in some cases.

Updated Notify() values for debug statements in evmisc.c

Return proper status from AcpiUtMutexInitialize, not just simply AE_OK.

Code and Data Size: Current and previous core subsystem library sizes are
shown below. These are the code and data sizes for the acpica.lib
produced

----
11 March 2004. Summary of changes for version 20040311:

1) ACPI CA Core Subsystem:

Fixed a problem where errors occurring during the parse phase of control
method execution did not abort cleanly. For example, objects created and
installed in the namespace were not deleted. This caused all subsequent
invocations of the method to return the AE_ALREADY_EXISTS exception.

Implemented a mechanism to force a control method to "Serialized"
execution
Implemented a mechanism to force a control method to "Serialized" execution
if the method attempts to create namespace objects. (The root of the
AE_ALREADY_EXISTS problem.)

Implemented support for the predefined _OSI "internal" control method.
Initial supported strings are "Linux", "Windows 2000", "Windows 2001",
and
"Windows 2001.1", and can be easily upgraded for new strings as
necessary.
Initial supported strings are "Linux", "Windows 2000", "Windows 2001", and
"Windows 2001.1", and can be easily upgraded for new strings as necessary.
This feature will allow "other" operating systems to execute the fully
tested, "Windows" code path through the ASL code

Global Lock Support: Now allows multiple acquires and releases with any
internal thread. Removed concept of "owning thread" for this special
mutex.
internal thread. Removed concept of "owning thread" for this special mutex.

Fixed two functions that were inappropriately declaring large objects on
the
CPU stack: PsParseLoop, NsEvaluateRelative. Reduces the stack usage
during
Fixed two functions that were inappropriately declaring large objects on the
CPU stack: PsParseLoop, NsEvaluateRelative. Reduces the stack usage during
method execution considerably.

Fixed a problem in the ACPI 2.0 FACS descriptor (actbl2.h) where the
S4Bios_f field was incorrectly defined as UINT32 instead of UINT32_BIT.

Fixed a problem where AcpiEvGpeDetect would fault if there were no GPEs
defined on the machine.

Implemented two runtime options: One to force all control method
execution
to "Serialized" to mimic Windows behavior, another to disable _OSI
support
Implemented two runtime options: One to force all control method execution
to "Serialized" to mimic Windows behavior, another to disable _OSI support
if it causes problems on a given machine.

    Debug Version: 160.3K Code, 66.0K Data, 226.3K Total

2) iASL Compiler/Disassembler:

Fixed an array size problem for FreeBSD that would cause the compiler to
fault.

----
20 February 2004. Summary of changes for version 20040220:

1) ACPI CA Core Subsystem:

Implemented execution of _SxD methods for Device objects in the
GetObjectInfo interface.

Fixed calls to _SST method to pass the correct arguments.

Added a call to _SST on wake to restore to "working" state.

Check for End-Of-Buffer failure case in the WalkResources interface.

Integrated fix for 64-bit alignment issue in acglobal.h by moving two
structures to the beginning of the file.

After wake, clear GPE status register(s) before enabling GPEs.

After wake, clear/enable power button. (Perhaps we should clear/enable
all
After wake, clear/enable power button. (Perhaps we should clear/enable all
fixed events upon wake.)

Fixed a couple of possible memory leaks in the Namespace manager.

Integrated latest acnetbsd.h file.

---
11 February 2004. Summary of changes for version 20040211:

1) ACPI CA Core Subsystem:

Completed investigation and implementation of the call-by-reference
mechanism for control method arguments.

Fixed a problem where a store of an object into an indexed package could
fail if the store occurs within a different method than the method that
created the package.

**Fixed a problem where the ToDecimal operator could return incorrect
results.**
Fixed a problem where the ToDecimal operator could return incorrect results.

**Fixed a problem where the CopyObject operator could fail on some of the
more**
Fixed a problem where the CopyObject operator could fail on some of the more
obscure objects (e.g., Reference objects.)

Improved the output of the Debug object to display buffer, package, and
index objects.

**Fixed a problem where constructs of the form "RefOf (ArgX)" did not
return**
Fixed a problem where constructs of the form "RefOf (ArgX)" did not return
the expected result.

Added permanent ACPI_REPORT_ERROR macros for all instances of the
ACPI_AML_INTERNAL exception.

Integrated latest version of acfreebsd.h

---
16 January 2004. Summary of changes for version 20040116:

The purpose of this release is primarily to update the copyright years in
each module, thus causing a huge number of diffs. There are a few small
functional changes, however.

1) ACPI CA Core Subsystem:

**Improved error messages when there is a problem finding one or more of
the**
Improved error messages when there is a problem finding one or more of the
required base ACPI tables

Reintroduced the definition of APIC_HEADER in actbl.h

Changed definition of MADT_ADDRESS_OVERRIDE to 64 bits (actbl.h)

Removed extraneous reference to NewObj in dsmthdat.c

2) iASL compiler

**Fixed a problem introduced in December that disabled the correct
disassembly**
Fixed a problem introduced in December that disabled the correct disassembly
of Resource Templates

---
03 December 2003. Summary of changes for version 20031203:

1) ACPI CA Core Subsystem:

Changed the initialization of Operation Regions during subsystem
init to perform two entire walks of the ACPI namespace; The first
to initialize the regions themselves, the second to execute the
_REG methods. This fixed some interdependencies across _REG
methods found on some machines.

Fixed a problem where a Store(Local0, Local1) could simply update
the object reference count, and not create a new copy of the
object if the Local1 is uninitialized.

Implemented support for the _SST reserved method during sleep
transitions.

Implemented support to clear the SLP_TYP and SLP_EN bits when
waking up, this is apparently required by some machines.

When sleeping, clear the wake status only if SleepState is not S5.

Fixed a problem in AcpiRsExtendedIrqResource() where an incorrect
pointer arithmetic advanced a string pointer too far.

Fixed a problem in AcpiTbGetTablePtr() where a garbage pointer
could be returned if the requested table has not been loaded.

Within the support for IRQ resources, restructured the handling of
the active and edge/level bits.

Fixed a few problems in AcpiPsxExecute() where memory could be
leaked under certain error conditions.

Improved error messages for the cases where the ACPI mode could
not be entered.

Code and Data Size: Current and previous core subsystem library
sizes are shown below. These are the code and data sizes for the
acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and
these values do not include any ACPI driver or OSPM code. The
debug version of the code includes the debug output trace
mechanism and has a much larger code and data size. Note that
these values will vary depending on the efficiency of the compiler
and the compiler options used during generation.

```
  Previous Release (20031029):
    Non-Debug Version:  74.4K Code,  10.1K Data,   84.5K Total
    Debug Version:     158.3K Code,  65.0K Data,  223.3K Total
  Current Release:
    Non-Debug Version:  74.8K Code,  10.1K Data,   84.9K Total
    Debug Version:     158.7K Code,  65.1K Data,  223.8K Total
```

2) iASL Compiler/Disassembler:

Implemented a fix for the iASL disassembler where a bad index was
generated. This was most noticeable on 64-bit platforms

---
29 October 2003. Summary of changes for version 20031029:

1) ACPI CA Core Subsystem:

Fixed a problem where a level-triggered GPE with an associated
_Lxx control method was incorrectly cleared twice.

Fixed a problem with the Field support code where an access can
occur beyond the end-of-region if the field is non-aligned but
extends to the very end of the parent region (resulted in an
AE_AML_REGION_LIMIT exception.)

Fixed a problem with ACPI Fixed Events where an RT Clock handler
would not get invoked on an RTC event. The RTC event bitmasks for
the PM1 registers were not being initialized properly.

Implemented support for executing _STA and _INI methods for
Processor objects. Although this is currently not part of the
ACPI specification, there is existing ASL code that depends on the
init-time execution of these methods.

Implemented and deployed a GetDescriptorName function to decode
the various types of internal descriptors. Guards against null
descriptors during debug output also.

Implemented and deployed a GetNodeName function to extract the 4-
character namespace node name. This function simplifies the debug
and error output, as well as guarding against null pointers during
output.

Implemented and deployed the ACPI_FORMAT_UINT64 helper macro to
simplify the debug and error output of 64-bit integers. This
macro replaces the HIDWORD and LODWORD macros for dumping these
integers.

Updated the implementation of the Stall() operator to only call
AcpiOsStall(), and also return an error if the operand is larger
than 255. This preserves the required behavior of not
relinquishing the processor, as would happen if AcpiOsSleep() was
called for "long stalls".

Constructs of the form "Store(LocalX,LocalX)" where LocalX is not
initialized are now treated as NOOPs.

Cleaned up a handful of warnings during 64-bit generation.

Fixed a reported error where and incorrect GPE number was passed
to the GPE dispatch handler. This value is only used for error
output, however. Used this opportunity to clean up and streamline
the GPE dispatch code.

Code and Data Size: Current and previous core subsystem library
sizes are shown below. These are the code and data sizes for the
acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and
these values do not include any ACPI driver or OSPM code. The

debug version of the code includes the debug output trace
mechanism and has a much larger code and data size. Note that
these values will vary depending on the efficiency of the compiler
and the compiler options used during generation.

```
  Previous Release (20031002):
    Non-Debug Version:  74.1K Code,   9.7K Data,   83.8K Total
    Debug Version:     157.9K Code,  64.8K Data,  222.7K Total
  Current Release:
    Non-Debug Version:  74.4K Code,  10.1K Data,   84.5K Total
    Debug Version:     158.3K Code,  65.0K Data,  223.3K Total
```

2) iASL Compiler/Disassembler:

Updated the iASL compiler to return an error if the operand to the
Stall() operator is larger than 255.

---

02 October 2003. Summary of changes for version 20031002:

1) ACPI CA Core Subsystem:

Fixed a problem with Index Fields where the index was not
incremented for fields that require multiple writes to the
index/data registers (Fields that are wider than the data
register.)

Fixed a problem with all Field objects where a write could go
beyond the end-of-field if the field was larger than the access
granularity and therefore required multiple writes to complete the
request. An extra write beyond the end of the field could happen
inadvertently.

Fixed a problem with Index Fields where a BUFFER_OVERFLOW error
would incorrectly be returned if the width of the Data Register
was larger than the specified field access width.

Completed fixes for LoadTable() and Unload() and verified their
operation. Implemented full support for the "DdbHandle" object
throughout the ACPI CA subsystem.

Implemented full support for the MADT and ECDT tables in the ACPI
CA header files. Even though these tables are not directly
consumed by ACPI CA, the header definitions are useful for ACPI
device drivers.

Integrated resource descriptor fixes posted to the Linux ACPI
list. This included checks for minimum descriptor length, and
support for trailing NULL strings within descriptors that have
optional string elements.

Code and Data Size: Current and previous core subsystem library
sizes are shown below. These are the code and data sizes for the
acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and
these values do not include any ACPI driver or OSPM code. The
debug version of the code includes the debug output trace
mechanism and has a much larger code and data size. Note that
these values will vary depending on the efficiency of the compiler
and the compiler options used during generation.

```
  Previous Release (20030918):
    Non-Debug Version:  73.9K Code,   9.7K Data,   83.6K Total
    Debug Version:     157.3K Code,  64.5K Data,  221.8K Total
  Current Release:
    Non-Debug Version:  74.1K Code,   9.7K Data,   83.8K Total
    Debug Version:     157.9K Code,  64.8K Data,  222.7K Total
```

2) iASL Compiler:

Implemented detection of non-ASCII characters within the input
source ASL file. This catches attempts to compile binary (AML)
files early in the compile, with an informative error message.

Fixed a problem where the disassembler would fault if the output
filename could not be generated or if the output file could not be
opened.

```
10782 ----------------------------------------
10783 18 September 2003.  Summary of changes for version 20030918:

10786 1) ACPI CA Core Subsystem:

10788 Found and fixed a longstanding problem with the late execution of
10789 the various deferred AML opcodes (such as Operation Regions,
10790 Buffer Fields, Buffers, and Packages).  If the name string
10791 specified for the name of the new object placed the object in a
10792 scope other than the current scope, the initialization/execution
10793 of the opcode failed.  The solution to this problem was to
10794 implement a mechanism where the late execution of such opcodes
10795 does not attempt to lookup/create the name a second time in an
10796 incorrect scope.  This fixes the "region size computed
10797 incorrectly" problem.

10799 Fixed a call to AcpiHwRegisterWrite in hwregs.c that was causing a
10800 Global Lock AE_BAD_PARAMETER error.

10802 Fixed several 64-bit issues with prototypes, casting and data
10803 types.

10805 Removed duplicate prototype from acdisasm.h

10807 Fixed an issue involving EC Operation Region Detach (Shaohua Li)

10809 Code and Data Size: Current and previous core subsystem library
10810 sizes are shown below.  These are the code and data sizes for the
10811 acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and
10812 these values do not include any ACPI driver or OSPM code.  The
10813 debug version of the code includes the debug output trace
10814 mechanism and has a much larger code and data size.  Note that
10815 these values will vary depending on the efficiency of the compiler
10816 and the compiler options used during generation.

10818   Previous Release:

10820     Non-Debug Version:  73.7K Code,   9.7K Data,   83.4K Total
10821     Debug Version:     156.9K Code,  64.2K Data,  221.1K Total
10822   Current Release:
10823     Non-Debug Version:  73.9K Code,   9.7K Data,   83.6K Total
10824     Debug Version:     157.3K Code,  64.5K Data,  221.8K Total

10827 2) Linux:

10829 Fixed the AcpiOsSleep implementation in osunixxf.c to pass the
10830 correct sleep time in seconds.

10832 ----------------------------------------
10833 14 July 2003.  Summary of changes for version 20030619:

10835 1) ACPI CA Core Subsystem:

10837 Parse SSDTs in order discovered, as opposed to reverse order
10838 (Hrvoje Habjanic)

10840 Fixes from FreeBSD and NetBSD. (Frank van der Linden, Thomas
10841 Klausner,
10842    Nate Lawson)

10845 2) Linux:
```

```
10847 Dynamically allocate SDT list (suggested by Andi Kleen)

10849 proc function return value cleanups (Andi Kleen)

10851 Correctly handle NMI watchdog during long stalls (Andrew Morton)

10853 Make it so acpismp=force works (reported by Andrew Morton)

10856 ----------------------------------------
10857 19 June 2003.  Summary of changes for version 20030619:

10859 1) ACPI CA Core Subsystem:

10861 Fix To/FromBCD, eliminating the need for an arch-specific #define.

10863 Do not acquire a semaphore in the S5 shutdown path.

10865 Fix ex_digits_needed for 0. (Takayoshi Kochi)

10867 Fix sleep/stall code reversal. (Andi Kleen)

10869 Revert a change having to do with control method calling
10870 semantics.

10872 2) Linux:

10874 acpiphp update (Takayoshi Kochi)

10876 Export acpi_disabled for sonypi (Stelian Pop)

10878 Mention acpismp=force in config help

10880 Re-add acpitable.c and acpismp=force. This improves backwards

10882 compatibility and also cleans up the code to a significant degree.

10884 Add ASUS Value-add driver (Karol Kozimor and Julien Lerouge)

10886 ----------------------------------------
10887 22 May 2003.  Summary of changes for version 20030522:

10889 1) ACPI CA Core Subsystem:

10891 Found and fixed a reported problem where an AE_NOT_FOUND error
10892 occurred occasionally during _BST evaluation.  This turned out to
10893 be an Owner ID allocation issue where a called method did not get
10894 a new ID assigned to it.  Eventually, (after 64k calls), the Owner
10895 ID UINT16 would wraparound so that the ID would be the same as the
10896 caller's and the called method would delete the caller's
10897 namespace.

10899 Implemented extended error reporting for control methods that are
10900 aborted due to a run-time exception.  Output includes the exact
10901 AML instruction that caused the method abort, a dump of the method
10902 locals and arguments at the time of the abort, and a trace of all
10903 nested control method calls.

10905 Modified the interpreter to allow the creation of buffers of zero
10906 length from the AML code. Implemented new code to ensure that no
10907 attempt is made to actually allocate a memory buffer (of length
10908 zero) - instead, a simple buffer object with a NULL buffer pointer
10909 and length zero is created.  A warning is no longer issued when
10910 the AML attempts to create a zero-length buffer.

10912 Implemented a workaround for the "leading asterisk issue" in
```

_HIDs, _UIDs, and _CIDs in the AML interpreter. One leading asterisk is automatically removed if present in any HID, UID, or CID strings. The iASL compiler will still flag this asterisk as an error, however.

Implemented full support for _CID methods that return a package of multiple CIDs (Compatible IDs). The AcpiGetObjectInfo() interface now additionally returns a device _CID list if present. This required a change to the external interface in order to pass an ACPI_BUFFER object as a parameter since the _CID list is of variable length.

Fixed a problem with the new AE_SAME_HANDLER exception where handler initialization code did not know about this exception.

Code and Data Size: Current and previous core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release (20030509):
    Non-Debug Version:  73.4K Code,   9.7K Data,   83.1K Total
    Debug Version:     156.1K Code,  63.9K Data,  220.0K Total
  Current Release:
    Non-Debug Version:  73.7K Code,   9.7K Data,   83.4K Total
    Debug Version:     156.9K Code,  64.2K Data,  221.1K Total
```

2) Linux:

Fixed a bug in which we would reinitialize the ACPI interrupt after it was already working, thus disabling all ACPI and the IRQs for any other device sharing the interrupt. (Thanks to Stian Jordet)

Toshiba driver update (John Belmonte)

Return only 0 or 1 for our interrupt handler status (Andrew Morton)

3) iASL Compiler:

Fixed a reported problem where multiple (nested) ElseIf() statements were not handled correctly by the compiler, resulting in incorrect warnings and incorrect AML code. This was a problem in both the ASL parser and the code generator.

4) Documentation:

Added changes to existing interfaces, new exception codes, and new text concerning reference count object management versus garbage collection.

---

09 May 2003. Summary of changes for version 20030509.

1) ACPI CA Core Subsystem:

Changed the subsystem initialization sequence to hold off

installation of address space handlers until the hardware has been initialized and the system has entered ACPI mode. This is because the installation of space handlers can cause _REG methods to be run. Previously, the _REG methods could potentially be run before ACPI mode was enabled.

Fixed some memory leak issues related to address space handler and notify handler installation. There were some problems with the reference count mechanism caused by the fact that the handler objects are shared across several namespace objects.

Fixed a reported problem where reference counts within the namespace were not properly updated when named objects created by method execution were deleted.

Fixed a reported problem where multiple SSDTs caused a deletion issue during subsystem termination. Restructured the table data structures to simplify the linked lists and the related code.

Fixed a problem where the table ID associated with secondary tables (SSDTs) was not being propagated into the namespace objects created by those tables. This would only present a problem for tables that are unloaded at run-time, however.

Updated AcpiOsReadable and AcpiOsWritable to use the ACPI_SIZE type as the length parameter (instead of UINT32).

Solved a long-standing problem where an ALREADY_EXISTS error appears on various systems. This problem could happen when there are multiple PCI_Config operation regions under a single PCI root bus. This doesn't happen very frequently, but there are some systems that do this in the ASL.

Fixed a reported problem where the internal DeleteNode function was incorrectly handling the case where a namespace node was the first in the parent's child list, and had additional peers (not the only child, but first in the list of children.)

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a much larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release
    Non-Debug Version:  73.7K Code,   9.5K Data,   83.2K Total
    Debug Version:     156.1K Code,  63.6K Data,  219.7K Total
  Current Release:
    Non-Debug Version:  73.4K Code,   9.7K Data,   83.1K Total
    Debug Version:     156.1K Code,  63.9K Data,  220.0K Total
```

2) Linux:

Allow ":" in OS override string (Ducrot Bruno)

Kobject fix (Greg KH)

3 iASL Compiler/Disassembler:

Fixed a problem in the generation of the C source code files (AML is emitted in C source statements for BIOS inclusion) where the

Ascii dump that appears within a C comment at the end of each line
could cause a compile time error if the AML sequence happens to
have an open comment or close comment sequence embedded.

---
24 April 2003. Summary of changes for version 20030424.

1) ACPI CA Core Subsystem:

Support for big-endian systems has been implemented. Most of the
support has been invisibly added behind big-endian versions of the
ACPI_MOVE_* macros.

Fixed a problem in AcpiHwDisableGpeBlock() and
AcpiHwClearGpeBlock() where an incorrect offset was passed to the
low level hardware write routine. The offset parameter was
actually eliminated from the low level read/write routines because
they had become obsolete.

Fixed a problem where a handler object was deleted twice during
the removal of a fixed event handler.

2) Linux:

A fix for SMP systems with link devices was contributed by

Compaq's Dan Zink.

(2.5) Return whether we handled the interrupt in our IRQ handler.
(Linux ISRs no longer return void, so we can propagate the handler
return value from the ACPI CA core back to the OS.)

3) Documentation:

The ACPI CA Programmer Reference has been updated to reflect new
interfaces and changes to existing interfaces.

---
28 March 2003. Summary of changes for version 20030328.

1) ACPI CA Core Subsystem:

The GPE Block Device support has been completed. New interfaces
are AcpiInstallGpeBlock and AcpiRemoveGpeBlock. The Event
interfaces (enable, disable, clear, getstatus) have been split
into separate interfaces for Fixed Events and General Purpose
Events (GPEs) in order to support GPE Block Devices properly.

Fixed a problem where the error message "Failed to acquire
semaphore" would appear during operations on the embedded
controller (EC).

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

  Previous Release
    Non-Debug Version: 72.3K Code,   9.5K Data,   81.8K Total
    Debug Version: 154.0K Code, 63.4K Data, 217.4K Total
  Current Release:
    Non-Debug Version: 73.7K Code,   9.5K Data,   83.2K Total
    Debug Version: 156.1K Code, 63.6K Data, 219.7K Total

---
28 February 2003. Summary of changes for version 20030228.

1) ACPI CA Core Subsystem:

The GPE handling and dispatch code has been completely overhauled
in preparation for support of GPE Block Devices (ID ACPI0006).
This affects internal data structures and code only; there should
be no differences visible externally. One new file has been
added, evgpeblk.c

The FADT fields GPE0_BLK_LEN and GPE1_BLK_LEN are now the only
fields that are used to determine the GPE block lengths. The
REGISTER_BIT_WIDTH field of the X_GPEx_BLK extended address
structures are ignored. This is per the ACPI specification but it
isn't very clear. The full 256 Block 0/1 GPEs are now supported
(the use of REGISTER_BIT_WIDTH limited the number of GPEs to 128).

In the SCI interrupt handler, removed the read of the PM1_CONTROL
register to look at the SCI_EN bit. On some machines, this read
causes an SMI event and greatly slows down SCI events. (This may
in fact be the cause of slow battery status response on some
systems.)

Fixed a problem where a store of a NULL string to a package object
could cause the premature deletion of the object. This was seen
during execution of the battery _BIF method on some systems,
resulting in no battery data being returned.

Added AcpiWalkResources interface to simplify parsing of resource
lists.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

  Previous Release
    Non-Debug Version: 72.0K Code,   9.5K Data,   81.5K Total
    Debug Version: 153.0K Code, 62.9K Data, 215.9K Total
  Current Release:
    Non-Debug Version: 72.3K Code,   9.5K Data,   81.8K Total
    Debug Version: 154.0K Code, 63.4K Data, 217.4K Total

2) Linux

S3 fixes (Ole Rohne)

Update ACPI PHP driver with to use new acpi_walk_resource API
(Bjorn Helgaas)

Add S4BIOS support (Pavel Machek)

Map in entire table before performing checksum (John Stultz)

Expand the mem= cmdline to allow the specification of reserved and
ACPI DATA blocks (Pavel Machek)

Never use ACPI on VISWS

Fix derive_pci_id (Ducrot Bruno, Alvaro Lopez)

Revert a change that allowed P_BLK lengths to be 4 or 5. This is
causing us to think that some systems support C2 when they really
don't.

Do not count processor objects for non-present CPUs (Thanks to
Dominik Brodowski)

3) iASL Compiler:

Fixed a problem where ASL include files could not be found and
opened.

Added support for the _PDC reserved name.

---
22 January 2003. Summary of changes for version 20030122.

1) ACPI CA Core Subsystem:

Added a check for constructs of the form: Store (Local0, Local0)
where Local0 is not initialized. Apparently, some BIOS
programmers believe that this is a NOOP. Since this store doesn't
do anything anyway, the new prototype behavior will ignore this
error. This is a case where we can relax the strict checking in
the interpreter in the name of compatibility.

2) Linux

The AcpiSrc Source Conversion Utility has been released with the
Linux package for the first time. This is the utility that is
used to convert the ACPI CA base source code to the Linux version.

(Both) Handle P_BLK lengths shorter than 6 more gracefully

(Both) Move more headers to include/acpi, and delete an unused
header.

(Both) Move drivers/acpi/include directory to include/acpi

(Both) Boot functions don't use cmdline, so don't pass it around

(Both) Remove include of unused header (Adrian Bunk)

(Both) acpiphp.h includes both linux/acpi.h and acpi_bus.h. Since
the
former now also includes the latter, acpiphp.h only needs the one,
now.

(2.5) Make it possible to select method of bios restoring after S3
resume. [=> no more ugly ifdefs] (Pavel Machek)

(2.5) Make proc write interfaces work (Pavel Machek)

(2.5) Properly init/clean up in cpufreq/acpi (Dominik Brodowski)

(2.5) Break out ACPI Perf code into its own module, under cpufreq
(Dominik Brodowski)

(2.4) S4BIOS support (Ducrot Bruno)

(2.4) Fix acpiphp_glue.c for latest ACPI struct changes (Sergio
Visinoni)

3) iASL Compiler:

Added support to disassemble SSDT and PSDTs.

Implemented support to obtain SSDTs from the Windows registry if
available.

---
09 January 2003. Summary of changes for version 20030109.

1) ACPI CA Core Subsystem:

Changed the behavior of the internal Buffer-to-String conversion
function. The current ACPI specification states that the contents
of the buffer are "converted to a string of two-character
hexadecimal numbers, each separated by a space". Unfortunately,
this definition is not backwards compatible with existing ACPI 1.0
implementations (although the behavior was not defined in the ACPI
1.0 specification). The new behavior simply copies data from the
buffer to the string until a null character is found or the end of
the buffer is reached. The new String object is always null
terminated. This problem was seen during the generation of _BIF
battery data where incorrect strings were returned for battery
type, etc. This will also require an errata to the ACPI
specification.

Renamed all instances of NATIVE_UINT and NATIVE_INT to
ACPI_NATIVE_UINT and ACPI_NATIVE_INT, respectively.

Copyright in all module headers (both Linux and non-Linux) has be
updated to 2003.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

  Previous Release
    Non-Debug Version: 72.0K Code,   9.5K Data,   81.5K Total
    Debug Version: 153.0K Code, 62.9K Data, 215.9K Total
  Current Release:
    Non-Debug Version: 72.0K Code,   9.5K Data,   81.5K Total
    Debug Version: 153.0K Code, 62.9K Data, 215.9K Total

2) Linux

Fixed an oops on module insertion/removal (Matthew Tippett)

11309 (2.4) Fix to handle dynamic size of mp_irqs (Joerg Prante)

11311 (2.5) Replace pr_debug (Randy Dunlap)

11313 (2.5) Remove usage of CPUFREQ_ALL_CPUS (Dominik Brodowski)

11315 (Both) Eliminate spawning of thread from timer callback, in favor
11316 of schedule_work()

11318 (Both) Show Lid status in /proc (Zdenek OGAR Skalak)

11320 (Both) Added define for Fixed Function HW region (Matthew Wilcox)

11322 (Both) Add missing statics to button.c (Pavel Machek)

11324 Several changes have been made to the source code translation
11325 utility that generates the Linux Code in order to make the code
11326 more "Linux-like":

11328 All typedefs on structs and unions have been removed in keeping
11329 with the Linux coding style.

11331 Removed the non-Linux SourceSafe module revision number from each
11332 module header.

11334 Completed major overhaul of symbols to be lowercased for linux.
11335 Doubled the number of symbols that are lowercased.

11337 Fixed a problem where identifiers within procedure headers and
11338 within quotes were not fully lower cased (they were left with a
11339 starting capital.)

11341 Some C macros whose only purpose is to allow the generation of 16-
11342 bit code are now completely removed in the Linux code, increasing
11343 readability and maintainability.

11345 --

11347 12 December 2002. Summary of changes for version 20021212.

11350 1) ACPI CA Core Subsystem:

11352 Fixed a problem where the creation of a zero-length AML Buffer
11353 would cause a fault.

11355 Fixed a problem where a Buffer object that pointed to a static AML
11356 buffer (in an ACPI table) could inadvertently be deleted, causing
11357 memory corruption.

11359 Fixed a problem where a user buffer (passed in to the external
11360 ACPI CA interfaces) could be overwritten if the buffer was too
11361 small to complete the operation, causing memory corruption.

11363 Fixed a problem in the Buffer-to-String conversion code where a
11364 string of length one was always returned, regardless of the size
11365 of the input Buffer object.

11367 Removed the NATIVE_CHAR data type across the entire source due to
11368 lack of need and lack of consistent use.

11370 Code and Data Size: Current core subsystem library sizes are shown
11371 below. These are the code and data sizes for the acpica.lib
11372 produced by the Microsoft Visual C++ 6.0 compiler, and these
11373 values do not include any ACPI driver or OSPM code. The debug
11374 version of the code includes the debug output trace mechanism and

11375 has a much larger code and data size. Note that these values will
11376 vary depending on the efficiency of the compiler and the compiler
11377 options used during generation.

11379   Previous Release
11380   Non-Debug Version: 72.1K Code,   9.5K Data,   81.6K Total
11381   Debug Version: 152.7K Code, 62.7K Data, 215.4K Total
11382   Current Release:
11383   Non-Debug Version: 72.0K Code,   9.5K Data,   81.5K Total
11384   Debug Version: 153.0K Code, 62.9K Data, 215.9K Total

11387 --
11388 05 December 2002. Summary of changes for version 20021205.

11390 1) ACPI CA Core Subsystem:

11392 Fixed a problem where a store to a String or Buffer object could
11393 cause corruption of the DSDT if the object type being stored was
11394 the same as the target object type and the length of the object
11395 being stored was equal to or smaller than the original (existing)
11396 target object. This was seen to cause corruption of battery _BIF
11397 buffers if the _BIF method modified the buffer on the fly.

11399 Fixed a problem where an internal error was generated if a control
11400 method invocation was used in an OperationRegion, Buffer, or
11401 Package declaration. This was caused by the deferred parsing of
11402 the control method and thus the deferred creation of the internal
11403 method object. The solution to this problem was to create the
11404 internal method object at the moment the method is encountered in
11405 the first pass - so that subsequent references to the method will
11406 able to obtain the required parameter count and thus properly
11407 parse the method invocation. This problem presented itself as an
11408 AE_AML_INTERNAL during the pass 1 parse phase during table load.

11410 Fixed a problem where the internal String object copy routine did
11411 not always allocate sufficient memory for the target String object
11412 and caused memory corruption. This problem was seen to cause
11413 "Allocation already present in list!" errors as memory allocation
11414 became corrupted.

11416 Implemented a new function for the evaluation of namespace objects
11417 that allows the specification of the allowable return object
11418 types. This simplifies a lot of code that checks for a return
11419 object of one or more specific objects returned from the
11420 evaluation (such as _STA, etc.) This may become and external
11421 function if it would be useful to ACPI-related drivers.

11423 Completed another round of prefixing #defines with "ACPI_" for
11424 clarity.

11426 Completed additional code restructuring to allow more modular
11427 linking for iASL compiler and AcpiExec. Several files were split
11428 creating new files. New files: nsparse.c dsinit.c evgpe.c

11430 Implemented an abort mechanism to terminate an executing control
11431 method via the AML debugger. This feature is useful for debugging
11432 control methods that depend (wait) for specific hardware
11433 responses.

11435 Code and Data Size: Current core subsystem library sizes are shown
11436 below. These are the code and data sizes for the acpica.lib
11437 produced by the Microsoft Visual C++ 6.0 compiler, and these
11438 values do not include any ACPI driver or OSPM code. The debug
11439 version of the code includes the debug output trace mechanism and
11440 has a much larger code and data size. Note that these values will

vary depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  71.4K Code,   9.0K Data,   80.4K Total
    Debug Version:     152.9K Code,  63.3K Data,  216.2K Total
  Current Release:
    Non-Debug Version:  72.1K Code,   9.5K Data,   81.6K Total
    Debug Version:     152.7K Code,  62.7K Data,  215.4K Total
```

2) iASL Compiler/Disassembler

Fixed a compiler code generation problem for "Interrupt" Resource
Descriptors. If specified in the ASL, the optional "Resource
Source Index" and "Resource Source" fields were not inserted into
the correct location within the AML resource descriptor, creating
an invalid descriptor.

Fixed a disassembler problem for "Interrupt" resource descriptors.
The optional "Resource Source Index" and "Resource Source" fields
were ignored.

---

22 November 2002. Summary of changes for version 20021122.

1) ACPI CA Core Subsystem:

Fixed a reported problem where an object stored to a Method Local
or Arg was not copied to a new object during the store - the
object pointer was simply copied to the Local/Arg. This caused
all subsequent operations on the Local/Arg to also affect the
original source of the store operation.

Fixed a problem where a store operation to a Method Local or Arg
was not completed properly if the Local/Arg contained a reference
(from RefOf) to a named field. The general-purpose store-to-
namespace-node code is now used so that this case is handled
automatically.

Fixed a problem where the internal object copy routine would cause
a protection fault if the object being copied was a Package and
contained either 1) a NULL package element or 2) a nested sub-
package.

Fixed a problem with the GPE initialization that resulted from an
ambiguity in the ACPI specification. One section of the
specification states that both the address and length of the GPE
block must be zero if the block is not supported. Another section
implies that only the address need be zero if the block is not
supported. The code has been changed so that both the address and
the length must be non-zero to indicate a valid GPE block (i.e.,
if either the address or the length is zero, the GPE block is
invalid.)

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  71.3K Code,   9.0K Data,   80.3K Total
    Debug Version:     152.7K Code,  63.2K Data,  215.5K Total
  Current Release:
    Non-Debug Version:  71.4K Code,   9.0K Data,   80.4K Total
    Debug Version:     152.9K Code,  63.3K Data,  216.2K Total
```

2) Linux

Cleaned up EC driver. Exported an external EC read/write
interface. By going through this, other drivers (most notably
sonypi) will be able to serialize access to the EC.

3) iASL Compiler/Disassembler

Implemented support to optionally generate include files for both
ASM and C (the -i switch). This simplifies BIOS development by
automatically creating include files that contain external
declarations for the symbols that are created within the

(optionally generated) ASM and C AML source files.

---

15 November 2002. Summary of changes for version 20021115.

1) ACPI CA Core Subsystem:

Fixed a memory leak problem where an error during resolution of

method arguments during a method invocation from another method
failed to cleanup properly by deleting all successfully resolved
argument objects.

Fixed a problem where the target of the Index() operator was not
correctly constructed if the source object was a package. This
problem has not been detected because the use of a target operand
with Index() is very rare.

Fixed a problem with the Index() operator where an attempt was
made to delete the operand objects twice.

Fixed a problem where an attempt was made to delete an operand
twice during execution of the CondRefOf() operator if the target
did not exist.

Implemented the first of perhaps several internal create object
functions that create and initialize a specific object type. This
consolidates duplicated code wherever the object is created, thus
shrinking the size of the subsystem.

Implemented improved debug/error messages for errors that occur
during nested method invocations. All executing method pathnames
are displayed (with the error) as the call stack is unwound - thus
simplifying debug.

Fixed a problem introduced in the 10/02 release that caused
premature deletion of a buffer object if a buffer was used as an
ASL operand where an integer operand is required (Thus causing an
implicit object conversion from Buffer to Integer.) The change in
the 10/02 release was attempting to fix a memory leak (albeit
incorrectly.)

Code and Data Size: Current core subsystem library sizes are shown

below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  71.9K Code,   9.1K Data,   81.0K Total
    Debug Version:     153.1K Code,  63.3K Data,  216.4K Total
  Current Release:
    Non-Debug Version:  71.3K Code,   9.0K Data,   80.3K Total
    Debug Version:     152.7K Code,  63.2K Data,  215.5K Total
```

2) Linux

Changed the implementation of the ACPI semaphores to use down()
instead of down_interruptable(). It is important that the
execution of ACPI control methods not be interrupted by signals.
Methods must run to completion, or the system may be left in an
unknown/unstable state.

Fixed a compilation error when CONFIG_SOFTWARE_SUSPEND is not set.
(Shawn Starr)

3) iASL Compiler/Disassembler

Changed the default location of output files. All output files
are now placed in the current directory by default instead of in
the directory of the source file. This change may affect some
existing makefiles, but it brings the behavior of the compiler in
line with other similar tools. The location of the output files
can be overridden with the -p command line switch.

---
11 November 2002. Summary of changes for version 20021111.

0) ACPI Specification 2.0B is released and is now available at:
http://www.acpi.info/index.html

1) ACPI CA Core Subsystem:

Implemented support for the ACPI 2.0 SMBus Operation Regions.
This includes the early detection and handoff of the request to
the SMBus region handler (avoiding all of the complex field
support code), and support for the bidirectional return packet
from an SMBus write operation. This paves the way for the
development of SMBus drivers in each host operating system.

Fixed a problem where the semaphore WAIT_FOREVER constant was
defined as 32 bits, but must be 16 bits according to the ACPI
specification. This had the side effect of causing ASL
Mutex/Event timeouts even though the ASL code requested a wait
forever. Changed all internal references to the ACPI timeout
parameter to 16 bits to prevent future problems. Changed the name
of WAIT_FOREVER to ACPI_WAIT_FOREVER.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib

produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  71.4K Code,   9.0K Data,   80.4K Total
    Debug Version:     152.3K Code,  63.0K Data,  215.3K Total
  Current Release:
    Non-Debug Version:  71.9K Code,   9.1K Data,   81.0K Total
    Debug Version:     153.1K Code,  63.3K Data,  216.4K Total
```

2) Linux

Module loading/unloading fixes (John Cagle)

3) iASL Compiler/Disassembler

Added support for the SMBBlockProcessCall keyword (ACPI 2.0)

Implemented support for the disassembly of all SMBus protocol
keywords (SMBQuick, SMBWord, etc.)

---
01 November 2002. Summary of changes for version 20021101.

1) ACPI CA Core Subsystem:

Fixed a problem where platforms that have a GPE1 block but no GPE0
block were not handled correctly. This resulted in a "GPE
overlap" error message. GPE0 is no longer required.

Removed code added in the previous release that inserted nodes
into the namespace in alphabetical order. This caused some side-
effects on various machines. The root cause of the problem is
still under investigation since in theory, the internal ordering
of the namespace nodes should not matter.

Enhanced error reporting for the case where a named object is not
found during control method execution. The full ACPI namepath
(name reference) of the object that was not found is displayed in
this case.

Note: as a result of the overhaul of the namespace object types in
the previous release, the namespace nodes for the predefined
scopes (_TZ, _PR, etc.) are now of the type ACPI_TYPE_LOCAL_SCOPE
instead of ACPI_TYPE_ANY. This simplifies the namespace
management code but may affect code that walks the namespace tree
looking for specific object types.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a much larger code and data size. Note that these values will
vary depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
```

```
11705     Non-Debug Version:  70.7K Code,   8.6K Data,   79.3K Total
11706     Debug Version:     151.7K Code,  62.4K Data,  214.1K Total
11707   Current Release:
11708     Non-Debug Version:  71.4K Code,   9.0K Data,   80.4K Total
11709     Debug Version:     152.3K Code,  63.0K Data,  215.3K Total

11712 2) Linux

11714 Fixed a problem introduced in the previous release where the
11715 Processor and Thermal objects were not recognized and installed in
11716 /proc.  This was related to the scope type change described above.

11719 3) iASL Compiler/Disassembler

11721 Implemented the -g option to get all of the required ACPI tables
11722 from the registry and save them to files (Windows version of the
11723 compiler only.)  The required tables are the FADT, FACS, and DSDT.

11725 Added ACPI table checksum validation during table disassembly in
11726 order to catch corrupted tables.

11729 ----------------------------------------
11730 22 October 2002.  Summary of changes for version 20021022.

11732 1) ACPI CA Core Subsystem:

11734 Implemented a restriction on the Scope operator that the target
11735 must already exist in the namespace at the time the operator is
11736 encountered (during table load or method execution).  In other
11737 words, forward references are not allowed and Scope() cannot
11738 create a new object. This changes the previous behavior where the
11739 interpreter would create the name if not found.  This new behavior
11740 correctly enables the search-to-root algorithm during namespace
11741 lookup of the target name.  Because of this upsearch, this fixes
11742 the known Compaq _SB_.OKEC problem and makes both the AML
11743 interpreter and iASL compiler compatible with other ACPI
11744 implementations.

11746 Completed a major overhaul of the internal ACPI object types for
11747 the ACPI Namespace and the associated operand objects.  Many of
11748 these types had become obsolete with the introduction of the two-
11749 pass namespace load.  This cleanup simplifies the code and makes
11750 the entire namespace load mechanism much clearer and easier to
11751 understand.

11753 Improved debug output for tracking scope opening/closing to help
11754 diagnose scoping issues.  The old scope name as well as the new
11755 scope name are displayed.  Also improved error messages for
11756 problems with ASL Mutex objects and error messages for GPE
11757 problems.

11759 Cleaned up the namespace dump code, removed obsolete code.

11761 All string output (for all namespace/object dumps) now uses the
11762 common ACPI string output procedure which handles escapes properly
11763 and does not emit non-printable characters.

11765 Fixed some issues with constants in the 64-bit version of the
11766 local C library (utclib.c)

11769 2) Linux
```

```
11771 EC Driver:  No longer attempts to acquire the Global Lock at
11772 interrupt level.

11775 3) iASL Compiler/Disassembler

11777 Implemented ACPI 2.0B grammar change that disallows all Type 1 and
11778 2 opcodes outside of a control method.  This means that the
11779 "executable" operators (versus the "namespace" operators) cannot
11780 be used at the table level; they can only be used within a control
11781 method.

11783 Implemented the restriction on the Scope() operator where the
11784 target must already exist in the namespace at the time the
11785 operator is encountered (during ASL compilation). In other words,
11786 forward references are not allowed and Scope() cannot create a new
11787 object.  This makes the iASL compiler compatible with other ACPI
11788 implementations and makes the Scope() implementation adhere to the
11789 ACPI specification.

11791 Fixed a problem where namepath optimization for the Alias operator
11792 was optimizing the wrong path (of the two namepaths.)  This caused
11793 a "Missing alias link" error message.

11795 Fixed a problem where an "unknown reserved name" warning could be
11796 incorrectly generated for names like "_SB" when the trailing
11797 underscore is not used in the original ASL.

11799 Fixed a problem where the reserved name check did not handle
11800 NamePaths with multiple NameSegs correctly.  The first nameseg of
11801 the NamePath was examined instead of the last NameSeg.

11804 ----------------------------------------

11806 02 October 2002.  Summary of changes for this release.

11809 1) ACPI CA Core Subsystem version 20021002:

11811 Fixed a problem where a store/copy of a string to an existing
11812 string did not always set the string length properly in the String
11813 object.

11815 Fixed a reported problem with the ToString operator where the
11816 behavior was identical to the ToHexString operator instead of just
11817 simply converting a raw buffer to a string data type.

11819 Fixed a problem where CopyObject and the other "explicit"
11820 conversion operators were not updating the internal namespace node
11821 type as part of the store operation.

11823 Fixed a memory leak during implicit source operand conversion
11824 where the original object was not deleted if it was converted to a
11825 new object of a different type.

11827 Enhanced error messages for all problems associated with namespace
11828 lookups.  Common procedure generates and prints the lookup name as
11829 well as the formatted status.

11831 Completed implementation of a new design for the Alias support
11832 within the namespace.  The existing design did not handle the case
11833 where a new object was assigned to one of the two names due to the
11834 use of an explicit conversion operator, resulting in the two names
11835 pointing to two different objects.  The new design simply points
11836 the Alias name to the original name node - not to the object.
```

This results in a level of indirection that must be handled in the name resolution mechanism.

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release
    Non-Debug Version:  69.6K Code,   8.3K Data,   77.9K Total
    Debug Version:     150.0K Code,  61.7K Data,  211.7K Total
  Current Release:
    Non-Debug Version:  70.7K Code,   8.6K Data,   79.3K Total
    Debug Version:     151.7K Code,  62.4K Data,  214.1K Total
```

2) Linux

Initialize thermal driver’s timer before it is used. (Knut Neumann)

Allow handling negative celsius values. (Kochi Takayoshi)

Fix thermal management and make trip points. R/W (Pavel Machek)

Fix /proc/acpi/sleep. (P. Christeas)

IA64 fixes. (David Mosberger)

Fix reversed logic in blacklist code. (Sergio Monteiro Basto)

Replace ACPI_DEBUG define with ACPI_DEBUG_OUTPUT. (Dominik Brodowski)

3) iASL Compiler/Disassembler

Clarified some warning/error messages.

---

18 September 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem version 20020918:

Fixed a reported problem with reference chaining (via the Index() and RefOf() operators) in the ObjectType() and SizeOf() operators. The definition of these operators includes the dereferencing of all chained references to return information on the base object.

Fixed a problem with stores to indexed package elements - the existing code would not complete the store if an "implicit conversion" was not performed. In other words, if the existing object (package element) was to be replaced completely, the code didn’t handle this case.

Relaxed typechecking on the ASL "Scope" operator to allow the target name to refer to an object of type Integer, String, or Buffer, in addition to the scoping object types (Device, predefined Scopes, Processor, PowerResource, and ThermalZone.) This allows existing AML code that has workarounds for a bug in

Windows to function properly. A warning is issued, however. This affects both the AML interpreter and the iASL compiler. Below is an example of this type of ASL code:

```
      Name(DEB,0x00)
      Scope(DEB)
      {
```

Fixed some reported problems with 64-bit integer support in the local implementation of C library functions (clib.c)

2) Linux

Use ACPI fix map region instead of IOAPIC region, since it is undefined in non-SMP.

Ensure that the SCI has the proper polarity and trigger, even on systems that do not have an interrupt override entry in the MADT.

2.5 big driver reorganization (Pat Mochel)

Use early table mapping code from acpitable.c (Andi Kleen)

New blacklist entries (Andi Kleen)

Blacklist improvements. Split blacklist code out into a separate file. Move checking the blacklist to very early. Previously, we would use ACPI tables, and then halfway through init, check the blacklist -- too late. Now, it’s early enough to completely fall-back to non-ACPI.

3) iASL Compiler/Disassembler version 20020918:

Fixed a problem where the typechecking code didn’t know that an alias could point to a method. In other words, aliases were not being dereferenced during typechecking.

---

29 August 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020829:

If the target of a Scope() operator already exists, it must be an object type that actually opens a scope -- such as a Device, Method, Scope, etc. This is a fatal runtime error. Similar error check has been added to the iASL compiler also.

Tightened up the namespace load to disallow multiple names in the same scope. This previously was allowed if both objects were of the same type. (i.e., a lookup was the same as entering a new name).

2) Linux

Ensure that the ACPI interrupt has the proper trigger and polarity.

local_irq_disable is extraneous. (Matthew Wilcox)

Make "acpi=off" actually do what it says, and not use the ACPI interpreter *or* the tables.

Added arch-neutral support for parsing SLIT and SRAT tables (Kochi Takayoshi)

3) iASL Compiler/Disassembler Version 20020829:

Implemented namepath optimization for name declarations. For example, a declaration like "Method (_SB_.ABCD)" would get optimized to "Method (ABCD)" if the declaration is within the _SB_ scope. This optimization is in addition to the named reference path optimization first released in the previous version. This would seem to complete all possible optimizations for namepaths within the ASL/AML.

If the target of a Scope() operator already exists, it must be an object type that actually opens a scope -- such as a Device, Method, Scope, etc.

Implemented a check and warning for unreachable code in the same block below a Return() statement.

Fixed a problem where the listing file was not generated if the compiler aborted if the maximum error count was exceeded (200).

Fixed a problem where the typechecking of method return values was broken. This includes the check for a return value when the method is invoked as a TermArg (a return value is expected.)

Fixed a reported problem where EOF conditions during a quoted string or comment caused a fault.

---
15 August 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020815:

Fixed a reported problem where a Store to a method argument that contains a reference did not perform the indirect store correctly. This problem was created during the conversion to the new reference object model - the indirect store to a method argument code was not updated to reflect the new model.

Reworked the ACPI mode change code to better conform to ACPI 2.0, handle corner cases, and improve code legibility (Kochi Takayoshi)

Fixed a problem with the pathname parsing for the carat (^) prefix. The heavy use of the carat operator by the new namepath optimization in the iASL compiler uncovered a problem with the AML interpreter handling of this prefix. In the case where one or more carats precede a single nameseg, the nameseg was treated as standalone and the search rule (to root) was inadvertently applied. This could cause both the iASL compiler and the interpreter to find the wrong object or to miss the error that should occur if the object does not exist at that exact pathname.

Found and fixed the problem where the HP Pavilion DSDT would not load. This was a relatively minor tweak to the table loading code (a problem caused by the unexpected encounter with a method invocation not within a control method), but it does not solve the overall issue of the execution of AML code at the table level. This investigation is still ongoing.

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these

values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release
    Non-Debug Version:  69.1K Code,   8.2K Data,   77.3K Total
    Debug Version:     149.4K Code,  61.6K Data,  211.0K Total
  Current Release:
    Non-Debug Version:  69.6K Code,   8.3K Data,   77.9K Total
    Debug Version:     150.0K Code,  61.7K Data,  211.7K Total
```

2) Linux

Remove redundant slab.h include (Brad Hards)

Fix several bugs in thermal.c (Herbert Nachtnebel)

Make CONFIG_ACPI_BOOT work properly (Pavel Machek)

Change acpi_system_suspend to use updated irq functions (Pavel Machek)

Export acpi_get_firmware_table (Matthew Wilcox)

Use proper root proc entry for ACPI (Kochi Takayoshi)

Fix early-boot table parsing (Bjorn Helgaas)

3) iASL Compiler/Disassembler

Reworked the compiler options to make them more consistent and to use two-letter options where appropriate. We were running out of sensible letters.   This may break some makefiles, so check the current options list by invoking the compiler with no parameters.

Completed the design and implementation of the ASL namepath optimization option for the compiler. This option optimizes all references to named objects to the shortest possible path. The first attempt tries to utilize a single nameseg (4 characters) and the "search-to-root" algorithm used by the interpreter. If that cannot be used (because either the name is not in the search path or there is a conflict with another object with the same name), the pathname is optimized using the carat prefix (usually a shorter string than specifying the entire path from the root.)

Implemented support to obtain the DSDT from the Windows registry (when the disassembly option is specified with no input file). Added this code as the implementation for AcpiOsTableOverride in the Windows OSL. Migrated the 16-bit code (used in the AcpiDump utility) to scan memory for the DSDT to the AcpiOsTableOverride function in the DOS OSL to make the disassembler truly OS independent.

Implemented a new option to disassemble and compile in one step. When used without an input filename, this option will grab the DSDT from the local machine, disassemble it, and compile it in one step.

Added a warning message for invalid escapes (a backslash followed by any character other than the allowable escapes). This catches the quoted string error "_SB_" (which should be "_SB_").

Also, there are numerous instances in the ACPI specification where this error occurs.

Added a compiler option to disable all optimizations. This is basically the "compatibility mode" because by using this option, the AML code will come out exactly the same as other ASL compilers.

Added error messages for incorrectly ordered dependent resource functions. This includes: missing EndDependentFn macro at end of dependent resource list, nested dependent function macros (both start and end), and missing StartDependentFn macro. These are common errors that should be caught at compile time.

Implemented _OSI support for the disassembler and compiler. _OSI must be included in the namespace for proper disassembly (because the disassembler must know the number of arguments.)

Added an "optimization" message type that is optional (off by default). This message is used for all optimizations - including constant folding, integer optimization, and namepath optimization.

---
25 July 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020725:

The AML Disassembler has been enhanced to produce compilable ASL code and has been integrated into the iASL compiler (see below) as well as the single-step disassembly for the AML debugger and the disassembler for the AcpiDump utility. All ACPI 2.0A opcodes, resource templates and macros are fully supported. The disassembler has been tested on over 30 different AML files, producing identical AML when the resulting disassembled ASL file is recompiled with the same ASL compiler.

Modified the Resource Manager to allow zero interrupts and zero dma channels during the GetCurrentResources call. This was causing problems on some platforms.

Added the AcpiOsRedirectOutput interface to the OSL to simplify output redirection for the AcpiOsPrintf and AcpiOsVprintf interfaces.

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release
    Non-Debug Version:  68.7K Code,   7.4K Data,   76.1K Total
    Debug Version:     142.9K Code,  58.7K Data,  201.6K Total
  Current Release:
    Non-Debug Version:  69.1K Code,   8.2K Data,   77.3K Total
    Debug Version:     149.4K Code,  61.6K Data,  211.0K Total
```

2) Linux

Fixed a panic in the EC driver (Dominik Brodowski)

Implemented checksum of the R/XSDT itself during Linux table scan (Richard Schaal)

3) iASL compiler

The AML disassembler is integrated into the compiler. The "-d" option invokes the disassembler to completely disassemble an input AML file, producing as output a text ASL file with the extension ".dsl" (to avoid name collisions with existing .asl source files.) A future enhancement will allow the disassembler to obtain the BIOS DSDT from the registry under Windows.

Fixed a problem with the VendorShort and VendorLong resource descriptors where an invalid AML sequence was created.

Implemented a fix for BufferData term in the ASL parser. It was inadvertently defined twice, allowing invalid syntax to pass and causing reduction conflicts.

Fixed a problem where the Ones opcode could get converted to a value of zero if "Ones" was used where a byte, word or dword value was expected. The 64-bit value is now truncated to the correct size with the correct value.

---
02 July 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020702:

The Table Manager code has been restructured to add several new features. Tables that are not required by the core subsystem (other than the FADT, DSDT, FACS, PSDTs, etc.) are no longer validated in any way and are returned from AcpiGetFirmwareTable if requested. The AcpiOsTableOverride interface is now called for each table that is loaded by the subsystem in order to allow the host to override any table it chooses. Previously, only the DSDT could be overridden. Added one new files, tbrsdt.c and tbgetall.c.

Fixed a problem with the conversion of internal package objects to external objects (when a package is returned from a control method.) The return buffer length was set to zero instead of the proper length of the package object.

Fixed a reported problem with the use of the RefOf and DeRefOf operators when passing reference arguments to control methods. A new type of Reference object is used internally for references produced by the RefOf operator.

Added additional error messages in the Resource Manager to explain AE_BAD_DATA errors when they occur during resource parsing.

Split the AcpiEnableSubsystem into two primitives to enable a finer granularity initialization sequence. These two calls should be called in this order: AcpiEnableSubsystem (flags), AcpiInitializeObjects (flags). The flags parameter remains the same.

2) Linux

Updated the ACPI utilities module to understand the new style of

fully resolved package objects that are now returned from the core
subsystem. This eliminates errors of the form:

```
    ACPI: PCI Interrupt Routing Table [\_SB_.PCI0.PPB_._PRT]
    acpi_utils-0430 [145] acpi_evaluate_reference:
        Invalid element in package (not a device reference)
```

The method evaluation utility uses the new buffer allocation
scheme instead of calling AcpiEvaluate Object twice.

Added support for ECDT. This allows the use of the Embedded

Controller before the namespace has been fully initialized, which
is necessary for ACPI 2.0 support, and for some laptops to
initialize properly. (Laptops using ECDT are still rare, so only
limited testing was performed of the added functionality.)

Fixed memory leaks in the EC driver.

Eliminated a brittle code structure in acpi_bus_init().

Eliminated the acpi_evaluate() helper function in utils.c. It is
no longer needed since acpi_evaluate_object can optionally
allocate memory for the return object.

Implemented fix for keyboard hang when getting battery readings on
some systems (Stephen White)

PCI IRQ routing update (Dominik Brodowski)

Fix an ifdef to allow compilation on UP with LAPIC but no IOAPIC
support

---

11 June 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020611:

Fixed a reported problem where constants such as Zero and One
appearing within _PRT packages were not handled correctly within
the resource manager code. Originally reported against the ASL
compiler because the code generator now optimizes integers to
their minimal AML representation (i.e. AML constants if possible.)
The _PRT code now handles all AML constant opcodes correctly
(Zero, One, Ones, Revision).

Fixed a problem with the Concatenate operator in the AML
interpreter where a buffer result object was incorrectly marked as
not fully evaluated, causing a run-time error of AE_AML_INTERNAL.

All package sub-objects are now fully resolved before they are
returned from the external ACPI interfaces. This means that name
strings are resolved to object handles, and constant operators
(Zero, One, Ones, Revision) are resolved to Integers.

Implemented immediate resolution of the AML Constant opcodes
(Zero, One, Ones, Revision) to Integer objects upon detection
within the AML stream. This has simplified and reduced the
generated code size of the subsystem by eliminating about 10
switch statements for these constants (which previously were
contained in Reference objects.) The complicating issues are that
the Zero opcode is used as a "placeholder" for unspecified
optional target operands and stores to constants are defined to be
no-ops.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  69.3K Code,   7.4K Data,   76.7K Total
    Debug Version:     143.8K Code,  58.8K Data,  202.6K Total
  Current Release:
    Non-Debug Version:  68.7K Code,   7.4K Data,   76.1K Total
    Debug Version:     142.9K Code,  58.7K Data,  201.6K Total
```

2) Linux

Added preliminary support for obtaining _TRA data for PCI root
bridges (Bjorn Helgaas).

3) iASL Compiler Version X2046:

Fixed a problem where the "_DDN" reserved name was defined to be a
control method with one argument. There are no arguments, and
_DDN does not have to be a control method.

Fixed a problem with the Linux version of the compiler where the
source lines printed with error messages were the wrong lines.
This turned out to be the "LF versus CR/LF" difference between
Windows and Unix. This appears to be the longstanding issue
concerning listing output and error messages.

Fixed a problem with the Linux version of compiler where opcode
names within error messages were wrong. This was caused by a
slight difference in the output of the Flex tool on Linux versus
Windows.

Fixed a problem with the Linux compiler where the hex output files
contained some garbage data caused by an internal buffer overrun.

---

17 May 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020517:

Implemented a workaround to an BIOS bug discovered on the HP
OmniBook where the FADT revision number and the table size are
inconsistent (ACPI 2.0 revision vs. ACPI 1.0 table size). The new
behavior is to fallback to using only the ACPI 1.0 fields of the
FADT if the table is too small to be a ACPI 2.0 table as claimed
by the revision number. Although this is a BIOS bug, this is a
case where the workaround is simple enough and with no side
effects, so it seemed prudent to add it. A warning message is
issued, however.

Implemented minimum size checks for the fixed-length ACPI tables -
- the FADT and FACS, as well as consistency checks between the
revision number and the table size.

Fixed a reported problem in the table override support where the

new table pointer was incorrectly treated as a physical address
instead of a logical address.

Eliminated the use of the AE_AML_ERROR exception and replaced it
with more descriptive codes.

Fixed a problem where an exception would occur if an ASL Field was
defined with no named Field Units underneath it (used by some
index fields).

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  68.8K Code,   7.1K Data,   75.9K Total
    Debug Version:     142.9K Code,  58.4K Data,  201.3K Total
  Current Release:
    Non-Debug Version:  69.3K Code,   7.4K Data,   76.7K Total
    Debug Version:     143.8K Code,  58.8K Data,  202.6K Total
```

2) Linux

Much work done on ACPI init (MADT and PCI IRQ routing support).
(Paul D. and Dominik Brodowski)

Fix PCI IRQ-related panic on boot (Sam Revitch)

Set BM_ARB_DIS when entering a sleep state (Ducrot Bruno)

Fix "MHz" typo (Dominik Brodowski)

Fix RTC year 2000 issue (Dominik Brodowski)

Preclude multiple button proc entries (Eric Brunet)

Moved arch-specific code out of include/platform/aclinux.h

3) iASL Compiler Version X2044:

Implemented error checking for the string used in the EISAID macro
(Usually used in the definition of the _HID object.) The code now
strictly enforces the PnP format - exactly 7 characters, 3
uppercase letters and 4 hex digits.

If a raw string is used in the definition of the _HID object
(instead of the EISAID macro), the string must contain all
alphanumeric characters (e.g., "*PNP0011" is not allowed because
of the asterisk.)

Implemented checking for invalid use of ACPI reserved names for
most of the name creation operators (Name, Device, Event, Mutex,
OperationRegion, PowerResource, Processor, and ThermalZone.)
Previously, this check was only performed for control methods.

Implemented an additional check on the Name operator to emit an
error if a reserved name that must be implemented in ASL as a
control method is used. We know that a reserved name must be a
method if it is defined with input arguments.

The warning emitted when a namespace object reference is not found
during the cross reference phase has been changed into an error.
The "External" directive should be used for names defined in other
modules.

4) Tools and Utilities

The 16-bit tools (adump16 and aexec16) have been regenerated and
tested.

Fixed a problem with the output of both acpidump and adump16 where
the indentation of closing parentheses and brackets was not

aligned properly with the parent block.

---
03 May 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020503:

Added support a new OSL interface that allows the host operating

system software to override the DSDT found in the firmware -
AcpiOsTableOverride. With this interface, the OSL can examine the
version of the firmware DSDT and replace it with a different one
if desired.

Added new external interfaces for accessing ACPI registers from
device drivers and other system software - AcpiGetRegister and
AcpiSetRegister. This was simply an externalization of the
existing AcpiHwBitRegister interfaces.

Fixed a regression introduced in the previous build where the
ASL/AML CreateField operator always returned an error,
"destination must be a NS Node".

Extended the maximum time (before failure) to successfully enable
ACPI mode to 3 seconds.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release
    Non-Debug Version:  68.5K Code,   7.0K Data,   75.5K Total
    Debug Version:     142.4K Code,  58.3K Data,  200.7K Total
  Current Release:
    Non-Debug Version:  68.8K Code,   7.1K Data,   75.9K Total
    Debug Version:     142.9K Code,  58.4K Data,  201.3K Total
```

2) Linux

Enhanced ACPI init code for SMP. We are now fully MPS and $PIR-
free. While 3 out of 4 of our in-house systems work fine, the last
one still hangs when testing the LAPIC timer.

Renamed many files in 2.5 kernel release to omit "acpi_" from the name.

Added warning on boot for Presario 711FR.

Sleep improvements (Pavel Machek)

ACPI can now be built without CONFIG_PCI enabled.

IA64: Fixed memory map functions (JI Lee)

3) iASL Compiler Version X2043:

Added support to allow the compiler to be integrated into the MS VC++ development environment for one-button compilation of single files or entire projects -- with error-to-source-line mapping.

Implemented support for compile-time constant folding for the Type3, Type4, and Type5 opcodes first defined in the ACPI 2.0 specification. This allows the ASL writer to use expressions instead of Integer/Buffer/String constants in terms that must evaluate to constants at compile time and will also simplify the emitted AML in any such sub-expressions that can be folded (evaluated at compile-time.) This increases the size of the compiler significantly because a portion of the ACPI CA AML interpreter is included within the compiler in order to pre-evaluate constant expressions.

Fixed a problem with the "Unicode" ASL macro that caused the compiler to fault. (This macro is used in conjunction with the _STR reserved name.)

Implemented an AML opcode optimization to use the Zero, One, and Ones opcodes where possible to further reduce the size of integer constants and thus reduce the overall size of the generated AML code.

Implemented error checking for new reserved terms for ACPI version 2.0A.

Implemented the -qr option to display the current list of ACPI reserved names known to the compiler.

Implemented the -qc option to display the current list of ASL operators that are allowed within constant expressions and can therefore be folded at compile time if the operands are constants.

4) Documentation

Updated the Programmer's Reference for new interfaces, data types, and memory allocation model options.

Updated the iASL Compiler User Reference to apply new format and add information about new features and options.

---

19 April 2002. Summary of changes for this release.

1) ACPI CA Core Subsystem Version 20020419:

The source code base for the Core Subsystem has been completely cleaned with PC-lint (FlexLint) for both 32-bit and 64-bit versions. The Lint option files used are included in the

/acpi/generate/lint directory.

Implemented enhanced status/error checking across the entire Hardware manager subsystem. Any hardware errors (reported from the OSL) are now bubbled up and will abort a running control method.

Fixed a problem where the per-ACPI-table integer width (32 or 64) was stored only with control method nodes, causing a fault when non-control method code was executed during table loading. The solution implemented uses a global variable to indicate table width across the entire ACPI subsystem. Therefore, ACPI CA does not support mixed integer widths across different ACPI tables (DSDT, SSDT).

Fixed a problem where NULL extended fields (X fields) in an ACPI 2.0 ACPI FADT caused the table load to fail. Although the existing ACPI specification is a bit fuzzy on this topic, the new behavior is to fall back on a ACPI 1.0 field if the corresponding ACPI 2.0 X field is zero (even though the table revision indicates a full ACPI 2.0 table.) The ACPI specification will be updated to clarify this issue.

Fixed a problem with the SystemMemory operation region handler where memory was always accessed byte-wise even if the AML-specified access width was larger than a byte. This caused problems on systems with memory-mapped I/O. Memory is now accessed with the width specified. On systems that do not support non-aligned transfers, a check is made to guarantee proper address alignment before proceeding in order to avoid an AML-caused alignment fault within the kernel.

Fixed a problem with the ExtendedIrq resource where only one byte of the 4-byte Irq field was extracted.

Fixed the AcpiExDigitsNeeded() procedure to support _UID. This function was out of date and required a rewrite.

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release
    Non-Debug Version:  66.6K Code,   6.5K Data,   73.1K Total
    Debug Version:     139.8K Code,  57.4K Data,  197.2K Total
  Current Release:
    Non-Debug Version:  68.5K Code,   7.0K Data,   75.5K Total
    Debug Version:     142.4K Code,  58.3K Data,  200.7K Total
```

2) Linux

PCI IRQ routing fixes (Dominik Brodowski)

3) iASL Compiler Version X2042:

Implemented an additional compile-time error check for a field unit whose size + minimum access width would cause a run-time

access beyond the end-of-region. Previously, only the field size
itself was checked.

The Core subsystem and iASL compiler now share a common parse
object in preparation for compile-time evaluation of the type
3/4/5 ASL operators.

Summary of changes for this release: 03_29_02

1) ACPI CA Core Subsystem Version 20020329:

Implemented support for late evaluation of TermArg operands to
Buffer and Package objects. This allows complex expressions to be
used in the declarations of these object types.

Fixed an ACPI 1.0 compatibility issue when reading Fields. In ACPI
1.0, if the field was larger than 32 bits, it was returned as a
buffer - otherwise it was returned as an integer. In ACPI 2.0,
the field is returned as a buffer only if the field is larger than
64 bits. The TableRevision is now considered when making this
conversion to avoid incompatibility with existing ASL code.

Implemented logical addressing for AcpiOsGetRootPointer. This
allows an RSDP with either a logical or physical address. With
this support, the host OS can now override all ACPI tables with
one logical RSDP. Includes implementation of "typed" pointer
support to allow a common data type for both physical and logical
pointers internally. This required a change to the
AcpiOsGetRootPointer interface.

Implemented the use of ACPI 2.0 Generic Address Structures for all
GPE, Fixed Event, and PM Timer I/O. This allows the use of memory
mapped I/O for these ACPI features.

Initialization now ignores not only non-required tables (All
tables other than the FADT, FACS, DSDT, and SSDTs), but also does
not validate the table headers of unrecognized tables.

Fixed a problem where a notify handler could only be
installed/removed on an object of type Device. All "notify"

objects are now supported -- Devices, Processor, Power, and
Thermal.

Removed most verbosity from the ACPI_DB_INFO debug level. Only
critical information is returned when this debug level is enabled.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

  Previous Release
    Non-Debug Version: 65.4K Code,   6.2K Data,   71.6K Total
    Debug Version: 138.0K Code, 56.6K Data, 194.6K Total
  Current Release:
    Non-Debug Version: 66.6K Code,   6.5K Data,   73.1K Total
    Debug Version: 139.8K Code, 57.4K Data, 197.2K Total

2) Linux:

The processor driver (acpi_processor.c) now fully supports ACPI
2.0-based processor performance control (e.g. Intel(R)
SpeedStep(TM) technology) Note that older laptops that only have
the Intel "applet" interface are not supported through this. The
'limit' and 'performance' interface (/proc) are fully functional.
[Note that basic policy for controlling performance state
transitions will be included in the next version of ospmd.] The
idle handler was modified to more aggressively use C2, and PIIX4
errata handling underwent a complete overhaul (big thanks to
Dominik Brodowski).

Added support for ACPI-PCI device binding (acpi_pci_root.c). _ADR-
based devices in the ACPI namespace are now dynamically bound
(associated) with their PCI counterparts (e.g. PCI1->01:00.0).
This allows, among other things, ACPI to resolve bus numbers for
subordinate PCI bridges.

Enhanced PCI IRQ routing to get the proper bus number for _PRT
entries defined underneath PCI bridges.

Added IBM 600E to bad bios list due to invalid _ADR value for
PIIX4 PCI-ISA bridge, resulting in improper PCI IRQ routing.

In the process of adding full MADT support (e.g. IOAPIC) for IA32
(acpi.c, mpparse.c) -- stay tuned.

Added back visual differentiation between fixed-feature and
control-method buttons in dmesg. Buttons are also subtyped (e.g.
button/power/PWRF) to simplify button identification.

We no longer use -Wno-unused when compiling debug. Please ignore
any "_THIS_MODULE defined but not used" messages.

Can now shut down the system using "magic sysrq" key.

3) iASL Compiler version 2041:

Fixed a problem where conversion errors for hex/octal/decimal
constants were not reported.

Implemented a fix for the General Register template Address field.
This field was 8 bits when it should be 64.

Fixed a problem where errors/warnings were no longer being emitted
within the listing output file.

Implemented the ACPI 2.0A restriction on ACPI Table Signatures to
exactly 4 characters, alphanumeric only.

Summary of changes for this release: 03_08_02

1) ACPI CA Core Subsystem Version 20020308:

Fixed a problem with AML Fields where the use of the "AccessAny"
keyword could cause an interpreter error due to attempting to read
or write beyond the end of the parent Operation Region.

Fixed a problem in the SystemMemory Operation Region handler where

an attempt was made to map memory beyond the end of the region.
This was the root cause of the "AE_ERROR" and "AE_NO_MEMORY"
errors on some Linux systems.

Fixed a problem where the interpreter/namespace "search to root"
algorithm was not functioning for some object types. Relaxed the
internal restriction on the search to allow upsearches for all
external object types as well as most internal types.

2) Linux:

We now use safe_halt() macro versus individual calls to sti | hlt.

Writing to the processor limit interface should now work. "echo 1"
will increase the limit, 2 will decrease, and 0 will reset to the

default.

3) ASL compiler:

Fixed segfault on Linux version.

Summary of changes for this release: 02_25_02

1) ACPI CA Core Subsystem:

Fixed a problem where the GPE bit masks were not initialized
properly, causing erratic GPE behavior.

Implemented limited support for multiple calling conventions. The
code can be generated with either the VPL (variable parameter
list, or "C") convention, or the FPL (fixed parameter list, or
"Pascal") convention. The core subsystem is about 3.4% smaller
when generated with FPL.

2) Linux

Re-add some /proc/acpi/event functionality that was lost during
the rewrite

Resolved issue with /proc events for fixed-feature buttons showing
up as the system device.

Fixed checks on C2/C3 latencies to be inclusive of maximum values.

Replaced AE_ERRORs in acpi_osl.c with more specific error codes.

Changed ACPI PRT option from "pci=noacpi-routing" to "pci=noacpi"

Fixed limit interface & usage to fix bugs with passive cooling
hysterisis.

Restructured PRT support.

Summary of changes for this label: 02_14_02

1) ACPI CA Core Subsystem:

Implemented support in AcpiLoadTable to allow loading of FACS and
FADT tables.

Suport for the now-obsolete interim 0.71 64-bit ACPI tables has
been removed. All 64-bit platforms should be migrated to the ACPI
2.0 tables. The actbl71.h header has been removed from the source
tree.

All C macros defined within the subsystem have been prefixed with
"ACPI_" to avoid collision with other system include files.

Removed the return value for the two AcpiOsPrint interfaces, since
it is never used and causes lint warnings for ignoring the return
value.

Added error checking to all internal mutex acquire and release
calls. Although a failure from one of these interfaces is
probably a fatal system error, these checks will cause the
immediate abort of the currently executing method or interface.

Fixed a problem where the AcpiSetCurrentResources interface could
fault. This was a side effect of the deployment of the new memory
allocation model.

Fixed a couple of problems with the Global Lock support introduced
in the last major build. The "common" (1.0/2.0) internal FACS was
being overwritten with the FACS signature and clobbering the
Global Lock pointer. Also, the actual firmware FACS was being
unmapped after construction of the "common" FACS, preventing
access to the actual Global Lock field within it. The "common"
internal FACS is no longer installed as an actual ACPI table; it
is used simply as a global.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release (02_07_01)
    Non-Debug Version:  65.2K Code,   6.2K Data,   71.4K Total
    Debug Version:     136.9K Code,  56.4K Data,  193.3K Total
  Current Release:
    Non-Debug Version:  65.4K Code,   6.2K Data,   71.6K Total
    Debug Version:     138.0K Code,  56.6K Data,  194.6K Total
```

2) Linux

Updated Linux-specific code for core macro and OSL interface
changes described above.

Improved /proc/acpi/event. It now can be opened only once and has
proper poll functionality.

Fixed and restructured power management (acpi_bus).

Only create /proc "view by type" when devices of that class exist.

Fixed "charging/discharging" bug (and others) in acpi_battery.

Improved thermal zone code.

12895 3) ASL Compiler, version X2039:

12898 Implemented the new compiler restriction on ASL String hex/octal
12899 escapes to non-null, ASCII values. An error results if an invalid
12900 value is used. (This will require an ACPI 2.0 specification
12901 change.)

12903 AML object labels that are output to the optional C and ASM source
12904 are now prefixed with both the ACPI table signature and table ID
12905 to help guarantee uniqueness within a large BIOS project.

12908 --
12909 Summary of changes for this label: 02_01_02

12911 1) ACPI CA Core Subsystem:

12913 ACPI 2.0 support is complete in the entire Core Subsystem and the
12914 ASL compiler. All new ACPI 2.0 operators are implemented and all
12915 other changes for ACPI 2.0 support are complete. With
12916 simultaneous code and data optimizations throughout the subsystem,
12917 ACPI 2.0 support has been implemented with almost no additional
12918 cost in terms of code and data size.

12920 Implemented a new mechanism for allocation of return buffers. If
12921 the buffer length is set to ACPI_ALLOCATE_BUFFER, the buffer will
12922 be allocated on behalf of the caller. Consolidated all return
12923 buffer validation and allocation to a common procedure. Return
12924 buffers will be allocated via the primary OSL allocation interface
12925 since it appears that a separate pool is not needed by most users.
12926 If a separate pool is required for these buffers, the caller can
12927 still use the original mechanism and pre-allocate the buffer(s).

12929 Implemented support for string operands within the DerefOf
12930 operator.

12932 Restructured the Hardware and Event managers to be table driven,
12933 simplifying the source code and reducing the amount of generated
12934 code.

12936 Split the common read/write low-level ACPI register bitfield
12937 procedure into a separate read and write, simplifying the code
12938 considerably.

12940 Obsoleted the AcpiOsCallocate OSL interface. This interface was
12941 used only a handful of times and didn't have enough critical mass
12942 for a separate interface. Replaced with a common calloc procedure
12943 in the core.

12945 Fixed a reported problem with the GPE number mapping mechanism
12946 that allows GPE1 numbers to be non-contiguous with GPE0.
12947 Reorganized the GPE information and shrunk a large array that was
12948 originally large enough to hold info for all possible GPEs (256)
12949 to simply large enough to hold all GPEs up to the largest GPE
12950 number on the machine.

12952 Fixed a reported problem with resource structure alignment on 64-
12953 bit platforms.

12955 Changed the AcpiEnableEvent and AcpiDisableEvent external
12956 interfaces to not require any flags for the common case of
12957 enabling/disabling a GPE.

12959 Implemented support to allow a "Notify" on a Processor object.

12961 Most TBDs in comments within the source code have been resolved
12962 and eliminated.

12965 Fixed a problem in the interpreter where a standalone parent
12966 prefix (^) was not handled correctly in the interpreter and
12967 debugger.

12969 Removed obsolete and unnecessary GPE save/restore code.

12971 Implemented Field support in the ASL Load operator. This allows a
12972 table to be loaded from a named field, in addition to loading a
12973 table directly from an Operation Region.

12975 Implemented timeout and handle support in the external Global Lock
12976 interfaces.

12978 Fixed a problem in the AcpiDump utility where pathnames were no
12979 longer being generated correctly during the dump of named objects.

12981 Modified the AML debugger to give a full display of if/while
12982 predicates instead of just one AML opcode at a time. (The
12983 predicate can have several nested ASL statements.) The old method
12984 was confusing during single stepping.

12986 Code and Data Size: Current core subsystem library sizes are shown
12987 below. These are the code and data sizes for the acpica.lib
12988 produced by the Microsoft Visual C++ 6.0 compiler, and these
12989 values do not include any ACPI driver or OSPM code. The debug
12990 version of the code includes the debug output trace mechanism and
12991 has a larger code and data size. Note that these values will vary
12992 depending on the efficiency of the compiler and the compiler
12993 options used during generation.

12995 Previous Release (12_18_01)
12996 Non-Debug Version: 66.1K Code, 5.5K Data, 71.6K Total
12997 Debug Version: 138.3K Code, 55.9K Data, 194.2K Total
12998 Current Release:
12999 Non-Debug Version: 65.2K Code, 6.2K Data, 71.4K Total
13000 Debug Version: 136.9K Code, 56.4K Data, 193.3K Total

13002 2) Linux

13004 Implemented fix for PIIX reverse throttling errata (Processor
13005 driver)

13007 Added new Limit interface (Processor and Thermal drivers)

13009 New thermal policy (Thermal driver)

13011 Many updates to /proc

13013 Battery "low" event support (Battery driver)

13015 Supports ACPI PCI IRQ routing (PCI Link and PCI root drivers)

13017 IA32 - IA64 initialization unification, no longer experimental

13019 Menuconfig options redesigned

13021 3) ASL Compiler, version X2037:

13023 Implemented several new output features to simplify integration of
13024 AML code into firmware: 1) Output the AML in C source code with

labels for each named ASL object. The original ASL source code is interleaved as C comments. 2) Output the AML in ASM source code with labels and interleaved ASL source. 3) Output the AML in raw hex table form, in either C or ASM.

Implemented support for optional string parameters to the LoadTable operator.

Completed support for embedded escape sequences within string literals. The compiler now supports all single character escapes as well as the Octal and Hex escapes. Note: the insertion of a null byte into a string literal (via the hex/octal escape) causes the string to be immediately terminated. A warning is issued.

Fixed a problem where incorrect AML was generated for the case where an ASL namepath consists of a single parent prefix (

) with no trailing name segments.

The compiler has been successfully generated with a 64-bit C compiler.

Summary of changes for this label: 12_18_01

1) Linux

Enhanced blacklist with reason and severity fields. Any table's signature may now be used to identify a blacklisted system.

Call _PIC control method to inform the firmware which interrupt model the OS is using. Turn on any disabled link devices.

Cleaned up busmgr /proc error handling (Andreas Dilger)

2) ACPI CA Core Subsystem:

Implemented ACPI 2.0 semantics for the "Break" operator (Exit from while loop)

Completed implementation of the ACPI 2.0 "Continue", "ConcatenateResTemplate", "DataTableRegion", and "LoadTable" operators. All new ACPI 2.0 operators are now implemented in both the ASL compiler and the AML interpreter. The only remaining ACPI 2.0 task is support for the String data type in the DerefOf operator. Fixed a problem with AcquireMutex where the status code was lost if the caller had to actually wait for the mutex.

Increased the maximum ASL Field size from 64K bits to 4G bits.

Completed implementation of the external Global Lock interfaces -- AcpiAcquireGlobalLock and AcpiReleaseGlobalLock. The Timeout and Handler parameters were added.

Completed another pass at removing warnings and issues when compiling with 64-bit compilers. The code now compiles cleanly with the Intel 64-bit C/C++ compiler. Most notably, the pointer add and subtract (diff) macros have changed considerably.

Created and deployed a new ACPI_SIZE type that is 64-bits wide on 64-bit platforms, 32-bits on all others. This type is used wherever memory allocation and/or the C sizeof() operator is used,

and affects the OSL memory allocation interfaces AcpiOsAllocate and AcpiOsCallocate.

Implemented sticky user breakpoints in the AML debugger.

Code and Data Size: Current core subsystem library sizes are shown below. These are the code and data sizes for the acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and these values do not include any ACPI driver or OSPM code. The debug version of the code includes the debug output trace mechanism and has a larger code and data size. Note that these values will vary depending on the efficiency of the compiler and the compiler options used during generation.

```
  Previous Release (12_05_01)
     Non-Debug Version:  64.7K Code,   5.3K Data,   70.0K Total
     Debug Version:     136.2K Code,  55.6K Data,  191.8K Total
   Current Release:
     Non-Debug Version:  66.1K Code,   5.5K Data,   71.6K Total
     Debug Version:     138.3K Code,  55.9K Data,  194.2K Total
```

3) ASL Compiler, version X2034:

Now checks for (and generates an error if detected) the use of a Break or Continue statement without an enclosing While statement.

Successfully generated the compiler with the Intel 64-bit C compiler.

Summary of changes for this label: 12_05_01

1) ACPI CA Core Subsystem:

The ACPI 2.0 CopyObject operator is fully implemented. This operator creates a new copy of an object (and is also used to bypass the "implicit conversion" mechanism of the Store operator.)

The ACPI 2.0 semantics for the SizeOf operator are fully implemented. The change is that performing a SizeOf on a reference object causes an automatic dereference of the object to tha actual value before the size is evaluated. This behavior was undefined in ACPI 1.0.

The ACPI 2.0 semantics for the Extended IRQ resource descriptor have been implemented. The interrupt polarity and mode are now independently set.

Fixed a problem where ASL Constants (Zero, One, Ones, Revision) appearing in Package objects were not properly converted to integers when the internal Package was converted to an external object (via the AcpiEvaluateObject interface.)

Fixed a problem with the namespace object deletion mechanism for objects created by control methods. There were two parts to this problem: 1) Objects created during the initialization phase method parse were not being deleted, and 2) The object owner ID mechanism to track objects was broken.

Fixed a problem where the use of the ASL Scope operator within a control method would result in an invalid opcode exception.

Fixed a problem introduced in the previous label where the buffer length required for the _PRT structure was not being returned correctly.

Code and Data Size: Current core subsystem library sizes are shown
below. These are the code and data sizes for the acpica.lib
produced by the Microsoft Visual C++ 6.0 compiler, and these
values do not include any ACPI driver or OSPM code. The debug
version of the code includes the debug output trace mechanism and
has a larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
  Previous Release (11_20_01)
     Non-Debug Version:  64.1K Code,   5.3K Data,   69.4K Total
     Debug Version:     135.1K Code,  55.4K Data,  190.5K Total

  Current Release:
     Non-Debug Version:  64.7K Code,   5.3K Data,   70.0K Total
     Debug Version:     136.2K Code,  55.6K Data,  191.8K Total
```

2) Linux:

Updated all files to apply cleanly against 2.4.16.

Added basic PCI Interrupt Routing Table (PRT) support for IA32
(acpi_pci.c), and unified the PRT code for IA32 and IA64. This
version supports both static and dyanmic PRT entries, but dynamic
entries are treated as if they were static (not yet
reconfigurable). Architecture- specific code to use this data is
absent on IA32 but should be available shortly.

Changed the initialization sequence to start the ACPI interpreter
(acpi_init) prior to initialization of the PCI driver (pci_init)
in init/main.c. This ordering is required to support PRT and
facilitate other (future) enhancement. A side effect is that the
ACPI bus driver and certain device drivers can no longer be loaded
as modules.

Modified the 'make menuconfig' options to allow PCI Interrupt
Routing support to be included without the ACPI Bus and other
device drivers.

3) ASL Compiler, version X2033:

Fixed some issues with the use of the new CopyObject and
DataTableRegion operators. Both are fully functional.

```
 ----------------------------------------
```

Summary of changes for this label: 11_20_01

20 November 2001. Summary of changes for this release.

1) ACPI CA Core Subsystem:

Updated Index support to match ACPI 2.0 semantics. Storing a
Integer, String, or Buffer to an Index of a Buffer will store only
the least-significant byte of the source to the Indexed buffer
byte. Multiple writes are not performed.

Fixed a problem where the access type used in an AccessAs ASL
operator was not recorded correctly into the field object.

Fixed a problem where ASL Event objects were created in a
signalled state. Events are now created in an unsignalled state.

The internal object cache is now purged after table loading and
initialization to reduce the use of dynamic kernel memory -- on
the assumption that object use is greatest during the parse phase

of the entire table (versus the run-time use of individual control
methods.)

ACPI 2.0 variable-length packages are now fully operational.

Code and Data Size: Code and Data optimizations have permitted new
feature development with an actual reduction in the library size.
Current core subsystem library sizes are shown below. These are
the code and data sizes for the acpica.lib produced by the
Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code
includes the debug output trace mechanism and has a larger code
and data size. Note that these values will vary depending on the
efficiency of the compiler and the compiler options used during
generation.

```
  Previous Release (11_09_01):
     Non-Debug Version:  63.7K Code,   5.2K Data,   68.9K Total
     Debug Version:     134.5K Code,  55.4K Data,  189.9K Total

  Current Release:
     Non-Debug Version:  64.1K Code,   5.3K Data,   69.4K Total
     Debug Version:     135.1K Code,  55.4K Data,  190.5K Total
```

2) Linux:

Enhanced the ACPI boot-time initialization code to allow the use
of Local APIC tables for processor enumeration on IA-32, and to
pave the way for a fully MPS-free boot (on SMP systems) in the
near future. This functionality replaces
arch/i386/kernel/acpitables.c, which was introduced in an earlier
2.4.15-preX release. To enable this feature you must add
"acpi_boot=on" to the kernel command line -- see the help entry
for CONFIG_ACPI_BOOT for more information. An IA-64 release is in
the works...

Restructured the configuration options to allow boot-time table
parsing support without inclusion of the ACPI Interpreter (and
other) code.

NOTE: This release does not include fixes for the reported events,
power-down, and thermal passive cooling issues (coming soon).

3) ASL Compiler:

Added additional typechecking for Fields within restricted access
Operation Regions. All fields within EC and CMOS regions must be
declared with ByteAcc. All fields withing SMBus regions must be
declared with the BufferAcc access type.

Fixed a problem where the listing file output of control methods
no longer interleaved the actual AML code with the ASL source
code.

```
----------------------------------------
```

Summary of changes for this label: 11_09_01

1) ACPI CA Core Subsystem:

Implemented ACPI 2.0-defined support for writes to fields with a
Buffer, String, or Integer source operand that is smaller than the
target field. In these cases, the source operand is zero-extended
to fill the target field.

Fixed a problem where a Field starting bit offset (within the
parent operation region) was calculated incorrectly if the

alignment of the field differed from the access width. This
affected CreateWordField, CreateDwordField, CreateQwordField, and
possibly other fields that use the "AccessAny" keyword.

Fixed a problem introduced in the 11_02_01 release where indirect
stores through method arguments did not operate correctly.

2) Linux:

Implemented boot-time ACPI table parsing support
(CONFIG_ACPI_BOOT) for IA32 and IA64 UP/SMP systems. This code
facilitates the use of ACPI tables (e.g. MADT, SRAT) rather than
legacy BIOS interfaces (e.g. MPS) for the configuration of system
processors, memory, and interrupts during setup_arch(). Note that
this patch does not include the required architecture-specific
changes required to apply this information -- subsequent patches
will be posted for both IA32 and IA64 to achieve this.

Added low-level sleep support for IA32 platforms, courtesy of Pat
Mochel. This allows IA32 systems to transition to/from various
sleeping states (e.g. S1, S3), although the lack of a centralized
driver model and power-manageable drivers will prevent its
(successful) use on most systems.

Revamped the ACPI 'menuconfig' layout: created new "ACPI Support"
submenu, unified IA32 and IA64 options, added new "Boot using ACPI
tables" option, etc.

Increased the default timeout for the EC driver from 1ms to 10ms
(1000 cycles of 10us) to try to address AE_TIME errors during EC
transactions.

Summary of changes for this label: 11_02_01

1) ACPI CA Core Subsystem:

ACPI 2.0 Support: Implemented ACPI 2.0 64-bit Field access
(QWordAcc keyword). All ACPI 2.0 64-bit support is now
implemented.

OSL Interfaces: Several of the OSL (AcpiOs*) interfaces required
changes to support ACPI 2.0 Qword field access. Read/Write
PciConfiguration(), Read/Write Memory(), and Read/Write Port() now
accept an ACPI_INTEGER (64 bits) as the value parameter. Also,
the value parameter for the address space handler interface is now
an ACPI_INTEGER. OSL implementations of these interfaces must now
handle the case where the Width parameter is 64.

Index Fields: Fixed a problem where unaligned bit assembly and
disassembly for IndexFields was not supported correctly.

Index and Bank Fields: Nested Index and Bank Fields are now
supported. During field access, a check is performed to ensure
that the value written to an Index or Bank register is not out of
the range of the register. The Index (or Bank) register is
written before each access to the field data. Future support will
include allowing individual IndexFields to be wider than the
DataRegister width.

Fields: Fixed a problem where the AML interpreter was incorrectly
attempting to write beyond the end of a Field/OpRegion. This was

a boundary case that occurred when a DWORD field was written to a
BYTE access OpRegion, forcing multiple writes and causing the
interpreter to write one datum too many.

Fields: Fixed a problem with Field/OpRegion access where the
starting bit address of a field was incorrectly calculated if the
current access type was wider than a byte (WordAcc, DwordAcc, or
QwordAcc).

Fields: Fixed a problem where forward references to individual
FieldUnits (individual Field names within a Field definition) were
not resolved during the AML table load.

Fields: Fixed a problem where forward references from a Field
definition to the parent Operation Region definition were not
resolved during the AML table load.

Fields: Duplicate FieldUnit names within a scope are now detected
during AML table load.

Acpi Interfaces: Fixed a problem where the AcpiGetName() interface
returned an incorrect name for the root node.

Code and Data Size: Code and Data optimizations have permitted new
feature development with an actual reduction in the library size.
Current core subsystem library sizes are shown below. These are
the code and data sizes for the acpica.lib produced by the
Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code
includes the debug output trace mechanism and has a larger code
and data size. Note that these values will vary depending on the
efficiency of the compiler and the compiler options used during
generation.

  Previous Release (10_18_01):
     Non-Debug Version: 63.9K Code,   5.1K Data,   69.0K Total
     Debug Version: 136.7K Code, 57.4K Data, 194.2K Total

  Current Release:
     Non-Debug Version: 63.7K Code,   5.2K Data,   68.9K Total
     Debug Version: 134.5K Code, 55.4K Data, 189.9K Total

 2) Linux:

Improved /proc processor output (Pavel Machek) Re-added
MODULE_LICENSE("GPL") to all modules.

 3) ASL Compiler version X2030:

Duplicate FieldUnit names within a scope are now detected and
flagged as errors.

 4) Documentation:

Programmer Reference updated to reflect OSL and address space
handler interface changes described above.

Summary of changes for this label: 10_18_01

ACPI CA Core Subsystem:

Fixed a problem with the internal object reference count mechanism
that occasionally caused premature object deletion. This resolves
all of the outstanding problem reports where an object is deleted
in the middle of an interpreter evaluation. Although this problem

only showed up in rather obscure cases, the solution to the
problem involved an adjustment of all reference counts involving
objects attached to namespace nodes.

Fixed a problem with Field support in the interpreter where
writing to an aligned field whose length is an exact multiple (2
or greater) of the field access granularity would cause an attempt
to write beyond the end of the field.

The top level AML opcode execution functions within the
interpreter have been renamed with a more meaningful and
consistent naming convention. The modules exmonad.c and
exdyadic.c were eliminated. New modules are exoparg1.c,
exoparg2.c, exoparg3.c, and exoparg6.c.

Support for the ACPI 2.0 "Mid" ASL operator has been implemented.

Fixed a problem where the AML debugger was causing some internal
objects to not be deleted during subsystem termination.

Fixed a problem with the external AcpiEvaluateObject interface
where the subsystem would fault if the named object to be
evaluated refered to a constant such as Zero, Ones, etc.

Fixed a problem with IndexFields and BankFields where the
subsystem would fault if the index, data, or bank registers were
not defined in the same scope as the field itself.

Added printf format string checking for compilers that support
this feature. Corrected more than 50 instances of issues with
format specifiers within invocations of ACPI_DEBUG_PRINT
throughout the core subsystem code.

The ASL "Revision" operator now returns the ACPI support level
implemented in the core - the value "2" since the ACPI 2.0 support
is more than 50% implemented.

Enhanced the output of the AML debugger "dump namespace" command
to output in a more human-readable form.

Current core subsystem library code sizes are shown below. These

are the code and data sizes for the acpica.lib produced by the
Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code
includes the full debug trace mechanism -- leading to a much

larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

```
     Previous Label (09_20_01):
     Non-Debug Version:    65K Code,     5K Data,     70K Total
     Debug Version:       138K Code,    58K Data,    196K Total

     This Label:

     Non-Debug Version:  63.9K Code,   5.1K Data,   69.0K Total
     Debug Version:     136.7K Code,  57.4K Data,  194.2K Total
```

Linux:

Implemented a "Bad BIOS Blacklist" to track machines that have
known ASL/AML problems.

Enhanced the /proc interface for the thermal zone driver and added

support for _HOT (the critical suspend trip point). The 'info'
file now includes threshold/policy information, and allows setting
of _SCP (cooling preference) and _TZP (polling frequency) values
to the 'info' file. Examples: "echo tzp=5 > info" sets the polling
frequency to 5 seconds, and "echo scp=1 > info" sets the cooling
preference to the passive/quiet mode (if supported by the ASL).

Implemented a workaround for a gcc bug that resuted in an OOPs
when loading the control method battery driver.

Summary of changes for this label: 09_20_01

 ACPI CA Core Subsystem:

The AcpiEnableEvent and AcpiDisableEvent interfaces have been
modified to allow individual GPE levels to be flagged as wake-
enabled (i.e., these GPEs are to remain enabled when the platform
sleeps.)

The AcpiEnterSleepState and AcpiLeaveSleepState interfaces now
support wake-enabled GPEs. This means that upon entering the
sleep state, all GPEs that are not wake-enabled are disabled.
When leaving the sleep state, these GPEs are reenabled.

A local double-precision divide/modulo module has been added to
enhance portability to OS kernels where a 64-bit math library is
not available. The new module is "utmath.c".

Several optimizations have been made to reduce the use of CPU
stack. Originally over 2K, the maximum stack usage is now below
2K at 1860 bytes (1.82k)

Fixed a problem with the AcpiGetFirmwareTable interface where the
root table pointer was not mapped into a logical address properly.

Fixed a problem where a NULL pointer was being dereferenced in the
interpreter code for the ASL Notify operator.

Fixed a problem where the use of the ASL Revision operator
returned an error. This operator now returns the current version
of the ACPI CA core subsystem.

Fixed a problem where objects passed as control method parameters
to AcpiEvaluateObject were always deleted at method termination.
However, these objects may end up being stored into the namespace
by the called method. The object reference count mechanism was
applied to these objects instead of a force delete.

Fixed a problem where static strings or buffers (contained in the
AML code) that are declared as package elements within the ASL
code could cause a fault because the interpreter would attempt to
delete them. These objects are now marked with the "static
object" flag to prevent any attempt to delete them.

Implemented an interpreter optimization to use operands directly
from the state object instead of extracting the operands to local
variables. This reduces stack use and code size, and improves
performance.

The module exxface.c was eliminated as it was an unnecessary extra
layer of code.

Current core subsystem library code sizes are shown below. These
are the code and data sizes for the acpica.lib produced by the
Microsoft Visual C++ 6.0 compiler, and these values do not include

any ACPI driver or OSPM code. The debug version of the code
includes the full debug trace mechanism -- leading to a much
larger code and data size. Note that these values will vary
depending on the efficiency of the compiler and the compiler
options used during generation.

  Non-Debug Version: 65K Code,   5K Data,   70K Total
(Previously 69K)   Debug Version: 138K Code, 58K Data, 196K
Total (Previously 195K)

Linux:

Support for ACPI 2.0 64-bit integers has been added.   All ACPI
Integer objects are now 64 bits wide

All Acpi data types and structures are now in lower case. Only
Acpi macros are upper case for differentiation.

 Documentation:

Changes to the external interfaces as described above.

Summary of changes for this label: 08_31_01

 ACPI CA Core Subsystem:

A bug with interpreter implementation of the ASL Divide operator
was found and fixed. The implicit function return value (not the
explicit store operands) was returning the remainder instead of
the quotient. This was a longstanding bug and it fixes several
known outstanding issues on various platforms.

The ACPI_DEBUG_PRINT and function trace entry/exit macros have
been further optimized for size. There are 700 invocations of the
DEBUG_PRINT macro alone, so each optimization reduces the size of
the debug version of the subsystem significantly.

A stack trace mechanism has been implemented. The maximum stack
usage is about 2K on 32-bit platforms. The debugger command "stat
stack" will display the current maximum stack usage.

All public symbols and global variables within the subsystem are
now prefixed with the string "Acpi". This keeps all of the
symbols grouped together in a kernel map, and avoids conflicts
with other kernel subsystems.

Most of the internal fixed lookup tables have been moved into the
code segment via the const operator.

Several enhancements have been made to the interpreter to both
reduce the code size and improve performance.

Current core subsystem library code sizes are shown below. These
are the code and data sizes for the acpica.lib produced by the
Microsoft Visual C++ 6.0 compiler, and these values do not include
any ACPI driver or OSPM code. The debug version of the code
includes the full debug trace mechanism which contains over 700
invocations of the DEBUG_PRINT macro, 500 function entry macro
invocations, and over 900 function exit macro invocations --
leading to a much larger code and data size. Note that these
values will vary depending on the efficiency of the compiler and
the compiler options used during generation.

        Non-Debug Version: 64K Code,   5K Data,   69K Total
Debug Version: 137K Code, 58K Data, 195K Total

 Linux:

Implemented wbinvd() macro, pending a kernel-wide definition.

Fixed /proc/acpi/event to handle poll() and short reads.

 ASL Compiler, version X2026:

Fixed a problem introduced in the previous label where the AML

code emitted for package objects produced packages with zero
length.

Summary of changes for this label: 08_16_01

ACPI CA Core Subsystem:

The following ACPI 2.0 ASL operators have been implemented in the
AML interpreter (These are already supported by the Intel ASL
compiler): ToDecimalString, ToHexString, ToString, ToInteger, and
ToBuffer. Support for 64-bit AML constants is implemented in the
AML parser, debugger, and disassembler.

The internal memory tracking mechanism (leak detection code) has
been upgraded to reduce the memory overhead (a separate tracking
block is no longer allocated for each memory allocation), and now
supports all of the internal object caches.

The data structures and code for the internal object caches have
been coelesced and optimized so that there is a single cache and
memory list data structure and a single group of functions that
implement generic cache management. This has reduced the code
size in both the debug and release versions of the subsystem.

The DEBUG_PRINT macro(s) have been optimized for size and replaced
by ACPI_DEBUG_PRINT. The syntax for this macro is slightly
different, because it generates a single call to an internal
function. This results in a savings of about 90 bytes per
invocation, resulting in an overall code and data savings of about
16% in the debug version of the subsystem.

 Linux:

Fixed C3 disk corruption problems and re-enabled C3 on supporting
machines.

Integrated low-level sleep code by Patrick Mochel.

Further tweaked source code Linuxization.

Other minor fixes.

 ASL Compiler:

Support for ACPI 2.0 variable length packages is fixed/completed.

Fixed a problem where the optional length parameter for the ACPI
2.0 ToString operator.

Fixed multiple extraneous error messages when a syntax error is
detected within the declaration line of a control method.

Summary of changes for this label: 07_17_01

ACPI CA Core Subsystem:

Added a new interface named AcpiGetFirmwareTable to obtain any ACPI table via the ACPI signature. The interface can be called at any time during kernel initialization, even before the kernel virtual memory manager is initialized and paging is enabled. This allows kernel subsystems to obtain ACPI tables very early, even before the ACPI CA subsystem is initialized.

Fixed a problem where Fields defined with the AnyAcc attribute could be resolved to the incorrect address under the following conditions: 1) the field width is larger than 8 bits and 2) the parent operation region is not defined on a DWORD boundary.

Fixed a problem where the interpreter is not being locked during namespace initialization (during execution of the _INI control methods), causing an error when an attempt is made to release it later.

ACPI 2.0 support in the AML Interpreter has begun and will be ongoing throughout the rest of this year. In this label, The Mod operator is implemented.

Added a new data type to contain full PCI addresses named ACPI_PCI_ID. This structure contains the PCI Segment, Bus, Device, and Function values.

Linux:

Enhanced the Linux version of the source code to change most capitalized ACPI type names to lowercase. For example, all instances of ACPI_STATUS are changed to acpi_status. This will result in a large diff, but the change is strictly cosmetic and aligns the CA code closer to the Linux coding standard.

OSL Interfaces:

The interfaces to the PCI configuration space have been changed to add the PCI Segment number and to split the single 32-bit combined DeviceFunction field into two 16-bit fields. This was accomplished by moving the four values that define an address in PCI configuration space (segment, bus, device, and function) to the new ACPI_PCI_ID structure.

The changes to the PCI configuration space interfaces led to a reexamination of the complete set of address space access interfaces for PCI, I/O, and Memory. The previously existing 18 interfaces have proven difficult to maintain (any small change must be propagated across at least 6 interfaces) and do not easily allow for future expansion to 64 bits if necessary. Also, on some systems, it would not be appropriate to demultiplex the access width (8, 16, 32,or 64) before calling the OSL if the corresponding native OS interfaces contain a similar access width parameter. For these reasons, the 18 address space interfaces have been replaced by these 6 new ones:

AcpiOsReadPciConfiguration
AcpiOsWritePciConfiguration
AcpiOsReadMemory
AcpiOsWriteMemory
AcpiOsReadPort
AcpiOsWritePort

Added a new interface named AcpiOsGetRootPointer to allow the OSL to perform the platform and/or OS-specific actions necessary to

obtain the ACPI RSDP table pointer. On IA-32 platforms, this interface will simply call down to the CA core to perform the low-memory search for the table. On IA-64, the RSDP is obtained from EFI. Migrating this interface to the OSL allows the CA core to

remain OS and platform independent.

Added a new interface named AcpiOsSignal to provide a generic "function code and pointer" interface for various miscellaneous signals and notifications that must be made to the host OS. The first such signals are intended to support the ASL Fatal and Breakpoint operators. In the latter case, the AcpiOsBreakpoint interface has been obsoleted.

The definition of the AcpiFormatException interface has been changed to simplify its use. The caller no longer must supply a buffer to the call; A pointer to a const string is now returned directly. This allows the call to be easily used in printf statements, etc. since the caller does not have to manage a local buffer.

ASL Compiler, Version X2025:

The ACPI 2.0 Switch/Case/Default operators have been implemented and are fully functional. They will work with all ACPI 1.0 interpreters, since the operators are simply translated to If/Else pairs.

The ACPI 2.0 ElseIf operator is implemented and will also work with 1.0 interpreters, for the same reason.

Implemented support for ACPI 2.0 variable-length packages. These packages have a separate opcode, and their size is determined by the interpreter at run-time.

Documentation The ACPI CA Programmer Reference has been updated to reflect the new interfaces and changes to existing interfaces.

Summary of changes for this label: 06_15_01

ACPI CA Core Subsystem:

Fixed a problem where a DWORD-accessed field within a Buffer object would get its byte address inadvertently rounded down to the nearest DWORD. Buffers are always Byte-accessible.

ASL Compiler, version X2024:

Fixed a problem where the Switch() operator would either fault or hang the compiler. Note however, that the AML code for this ACPI 2.0 operator is not yet implemented.

Compiler uses the new AcpiOsGetTimer interface to obtain compile timings.

Implementation of the CreateField operator automatically converts a reference to a named field within a resource descriptor from a byte offset to a bit offset if required.

Added some missing named fields from the resource descriptor support. These are the names that are automatically created by the compiler to reference fields within a descriptor. They are only valid at compile time and are not passed through to the AML interpreter.

Resource descriptor named fields are now typed as Integers and
subject to compile-time typechecking when used in expressions.

Summary of changes for this label: 05_18_01

 ACPI CA Core Subsystem:

Fixed a couple of problems in the Field support code where bits
from adjacent fields could be returned along with the proper field
bits. Restructured the field support code to improve performance,
readability and maintainability.

New DEBUG_PRINTP macro automatically inserts the procedure name
into the output, saving hundreds of copies of procedure name
strings within the source, shrinking the memory footprint of the
debug version of the core subsystem.

 Source Code Structure:

The source code directory tree was restructured to reflect the
current organization of the component architecture. Some files
and directories have been moved and/or renamed.

 Linux:

Fixed leaking kacpidpc processes.

Fixed queueing event data even when /proc/acpi/event is not
opened.

 ASL Compiler, version X2020:

Memory allocation performance enhancement - over 24X compile time
improvement on large ASL files. Parse nodes and namestring
buffers are now allocated from a large internal compiler buffer.

The temporary .SRC file is deleted unless the "-s" option is
specified

The "-d" debug output option now sends all output to the .DBG file
instead of the console.

"External" second parameter is now optional

"ElseIf" syntax now properly allows the predicate

Last operand to "Load" now recognized as a Target operand

Debug object can now be used anywhere as a normal object.

ResourceTemplate now returns an object of type BUFFER

EISAID now returns an object of type INTEGER

"Index" now works with a STRING operand

"LoadTable" now accepts optional parameters

"ToString" length parameter is now optional

"Interrupt (ResourceType," parse error fixed.

"Register" with a user-defined region space parse error fixed

Escaped backslash at the end of a string ("\\") scan/parse error
fixed

"Revision" is now an object of type INTEGER.

Summary of changes for this label: 05_02_01

Linux:

/proc/acpi/event now blocks properly.

Removed /proc/sys/acpi. You can still dump your DSDT from
/proc/acpi/dsdt.

 ACPI CA Core Subsystem:

Fixed a problem introduced in the previous label where some of the
"small" resource descriptor types were not recognized.

Improved error messages for the case where an ASL Field is outside
the range of the parent operation region.

 ASL Compiler, version X2018:

Added error detection for ASL Fields that extend beyond the length
of the parent operation region (only if the length of the region
is known at compile time.) This includes fields that have a
minimum access width that is smaller than the parent region, and
individual field units that are partially or entirely beyond the
extent of the parent.

Summary of changes for this label: 04_27_01

 ACPI CA Core Subsystem:

Fixed a problem where the namespace mutex could be released at the
wrong time during execution of AcpiRemoveAddressSpaceHandler.

Added optional thread ID output for debug traces, to simplify
debugging of multiple threads. Added context switch notification
when the debug code realizes that a different thread is now
executing ACPI code.

Some additional external data types have been prefixed with the
string "ACPI_" for consistency. This may effect existing code.
The data types affected are the external callback typedefs - e.g.,

WALK_CALLBACK becomes ACPI_WALK_CALLBACK.

 Linux:

Fixed an issue with the OSL semaphore implementation where a
thread was waking up with an error from receiving a SIGCHLD
signal.

Linux version of ACPI CA now uses the system C library for string
manipulation routines instead of a local implementation.

Cleaned up comments and removed TBDs.

```
13950  ASL Compiler, version X2017:

13952 Enhanced error detection and reporting for all file I/O
13953 operations.

13955  Documentation:

13957 Programmer Reference updated to version 1.06.

13961 ----------------------------------------
13962 Summary of changes for this label: 04_13_01

13964  ACPI CA Core Subsystem:

13966 Restructured support for BufferFields and RegionFields.
13967 BankFields support is now fully operational.  All known 32-bit
13968 limitations on field sizes have been removed.  Both BufferFields
13969 and (Operation) RegionFields are now supported by the same field
13970 management code.

13972 Resource support now supports QWORD address and IO resources. The
13973 16/32/64 bit address structures and the Extended IRQ structure
13974 have been changed to properly handle Source Resource strings.

13976 A ThreadId of -1 is now used to indicate a "mutex not acquired"
13977 condition internally and must never be returned by AcpiOsThreadId.
13978 This reserved value was changed from 0 since Unix systems allow a
13979 thread ID of 0.

13981 Linux:

13983 Driver code reorganized to enhance portability

13985 Added a kernel configuration option to control ACPI_DEBUG

13987 Fixed the EC driver to honor _GLK.

13989 ASL Compiler, version X2016:

13991 Fixed support for the "FixedHw" keyword.  Previously, the FixedHw
13992 address space was set to 0, not 0x7f as it should be.

13994  ----------------------------------------
13995 Summary of changes for this label: 03_13_01

13997  ACPI CA Core Subsystem:

13999 During ACPI initialization, the _SB_._INI method is now run if
14000 present.

14002 Notify handler fix - notifies are deferred until the parent method
14003 completes execution.  This fixes the "mutex already acquired"
14004 issue seen occasionally.

14006 Part of the "implicit conversion" rules in ACPI 2.0 have been
14007 found to cause compatibility problems with existing ASL/AML.  The
14008 convert "result-to-target-type" implementation has been removed
14009 for stores to method Args and Locals.  Source operand conversion
14010 is still fully implemented.  Possible changes to ACPI 2.0
14011 specification pending.

14013 Fix to AcpiRsCalculatePciRoutingTableLength to return correct
14014 length.
```

```
14016 Fix for compiler warnings for 64-bit compiles.

14018  Linux:

14020 /proc output aligned for easier parsing.

14022 Release-version compile problem fixed.

14024 New kernel configuration options documented in Configure.help.

14026 IBM 600E - Fixed Sleep button may generate "Invalid <NULL>
14027 context" message.

14029  OSPM:

14031 Power resource driver integrated with bus manager.

14033 Fixed kernel fault during active cooling for thermal zones.

14035 Source Code:

14037 The source code tree has been restructured.

14041 ----------------------------------------
14042 Summary of changes for this label: 03_02_01

14044  Linux OS Services Layer (OSL):

14046 Major revision of all Linux-specific code.

14048 Modularized all ACPI-specific drivers.

14050 Added new thermal zone and power resource drivers.

14052 Revamped /proc interface (new functionality is under /proc/acpi).

14054 New kernel configuration options.

14056  Linux known issues:

14058 New kernel configuration options not documented in Configure.help
14059 yet.

14062 Module dependencies not currently implemented. If used, they
14063 should be loaded in this order: busmgr, power, ec, system,
14064 processor, battery, ac_adapter, button, thermal.

14066 Modules will not load if CONFIG_MODVERSION is set.

14068 IBM 600E - entering S5 may reboot instead of shutting down.

14070 IBM 600E - Sleep button may generate "Invalid <NULL> context"
14071 message.

14073 Some systems may fail with "execution mutex already acquired"
14074 message.

14076  ACPI CA Core Subsystem:

14078 Added a new OSL Interface, AcpiOsGetThreadId.  This was required
14079 for the  deadlock detection code. Defined to return a non-zero, 32-
14080 bit thread ID for the currently executing thread.  May be a non-
```

zero constant integer on single-thread systems.

Implemented deadlock detection for internal subsystem mutexes. We
may add conditional compilation for this code (debug only) later.

ASL/AML Mutex object semantics are now fully supported. This
includes multiple acquires/releases by owner and support for the

Mutex SyncLevel parameter.

A new "Force Release" mechanism automatically frees all ASL
Mutexes that have been acquired but not released when a thread
exits the interpreter. This forces conformance to the ACPI spec
("All mutexes must be released when an invocation exits") and
prevents deadlocked ASL threads. This mechanism can be expanded
(later) to monitor other resource acquisitions if OEM ASL code
continues to misbehave (which it will).

Several new ACPI exception codes have been added for the Mutex
support.

Recursive method calls are now allowed and supported (the ACPI
spec does in fact allow recursive method calls.) The number of
recursive calls is subject to the restrictions imposed by the
SERIALIZED method keyword and SyncLevel (ACPI 2.0) method
parameter.

Implemented support for the SyncLevel parameter for control
methods (ACPI 2.0 feature)

Fixed a deadlock problem when multiple threads attempted to use
the interpreter.

Fixed a problem where the string length of a String package
element was not always set in a package returned from
AcpiEvaluateObject.

Fixed a problem where the length of a String package element was
not always included in the length of the overall package returned
from AcpiEvaluateObject.

Added external interfaces (Acpi*) to the ACPI debug memory
manager. This manager keeps a list of all outstanding
allocations, and can therefore detect memory leaks and attempts to
free memory blocks more than once. Useful for code such as the
power manager, etc. May not be appropriate for device drivers.
Performance with the debug code enabled is slow.

The ACPI Global Lock is now an optional hardware element.

ASL Compiler Version X2015:

Integrated changes to allow the compiler to be generated on
multiple platforms.

Linux makefile added to generate the compiler on Linux

Source Code:

All platform-specific headers have been moved to their own
subdirectory, Include/Platform.

New source file added, Interpreter/ammutex.c

New header file, Include/acstruct.h

Documentation:

The programmer reference has been updated for the following new
interfaces: AcpiOsGetThreadId AcpiAllocate AcpiCallocate AcpiFree

---
Summary of changes for this label: 02_08_01

Core ACPI CA Subsystem: Fixed a problem where an error was
incorrectly returned if the return resource buffer was larger than
the actual data (in the resource interfaces).

References to named objects within packages are resolved to the

full pathname string before packages are returned directly (via
the AcpiEvaluateObject interface) or indirectly via the resource
interfaces.

Linux OS Services Layer (OSL):

Improved /proc battery interface.

Added C-state debugging output and other miscellaneous fixes.

ASL Compiler Version X2014:

All defined method arguments can now be used as local variables,
including the ones that are not actually passed in as parameters.
The compiler tracks initialization of the arguments and issues an
exception if they are used without prior assignment (just like
locals).

The -o option now specifies a filename prefix that is used for all
output files, including the AML output file. Otherwise, the
default behavior is as follows: 1) the AML goes to the file
specified in the DSDT. 2) all other output files use the input
source filename as the base.

Summary of changes for this label: 01_25_01

Core ACPI CA Subsystem: Restructured the implementation of object
store support within the interpreter. This includes support for
the Store operator as well as any ASL operators that include a
target operand.

Partially implemented support for Implicit Result-to-Target
conversion. This is when a result object is converted on the fly
to the type of an existing target object. Completion of this
support is pending further analysis of the ACPI specification
concerning this matter.

CPU-specific code has been removed from the subsystem (hardware
directory).

New Power Management Timer functions added

Linux OS Services Layer (OSL): Moved system state transition code
to the core, fixed it, and modified Linux OSL accordingly.

Fixed C2 and C3 latency calculations.

We no longer use the compilation date for the version message on
initialization, but retrieve the version from AcpiGetSystemInfo().

Incorporated for fix Sony VAIO machines.

Documentation: The Programmer Reference has been updated and
reformatted.

ASL Compiler: Version X2013: Fixed a problem where the line
numbering and error reporting could get out of sync in the
presence of multiple include files.

Summary of changes for this label: 01_15_01

Core ACPI CA Subsystem:

Implemented support for type conversions in the execution of the
ASL Concatenate operator (The second operand is converted to
match the type of the first operand before concatenation.)

Support for implicit source operand conversion is partially
implemented.   The ASL source operand types Integer, Buffer, and
String are freely interchangeable for most ASL operators and are
converted by the interpreter on the fly as required. Implicit
Target operand conversion (where the result is converted to the
target type before storing) is not yet implemented.

Support for 32-bit and 64-bit BCD integers is implemented.

Problem fixed where a field read on an aligned field could cause a
read past the end of the field.

New exception, AE_AML_NO_RETURN_VALUE, is returned when a method
does not return a value, but the caller expects one. (The ASL
compiler flags this as a warning.)

ASL Compiler:

Version X2011:
1. Static typechecking of all operands is implemented. This
prevents the use of invalid objects (such as using a Package where
an Integer is required) at compile time instead of at interpreter
run-time.
2. The ASL source line is printed with ALL errors and warnings.
3. Bug fix for source EOF without final linefeed.
4. Debug option is split into a parse trace and a namespace trace.
5. Namespace output option (-n) includes initial values for
integers and strings.
6. Parse-only option added for quick syntax checking.
7. Compiler checks for duplicate ACPI name declarations

Version X2012:
1. Relaxed typechecking to allow interchangeability between
strings, integers, and buffers. These types are now converted by
the interpreter at runtime.
2. Compiler reports time taken by each internal subsystem in the
debug   output file.

Summary of changes for this label: 12_14_00

ASL Compiler:

This is the first official release of the compiler. Since the
compiler requires elements of the Core Subsystem, this label

synchronizes everything.

Summary of changes for this label: 12_08_00

Fixed a problem where named references within the ASL definition
of both OperationRegions and CreateXXXFields did not work
properly. The symptom was an AE_AML_OPERAND_TYPE during
initialization of the region/field. This is similar (but not
related internally) to the problem that was fixed in the last
label.

Implemented both 32-bit and 64-bit support for the BCD ASL
functions ToBCD and FromBCD.

Updated all legal headers to include "2000" in the copyright
years.

Summary of changes for this label: 12_01_00

Fixed a problem where method invocations within the ASL definition
of both OperationRegions and CreateXXXFields did not work
properly. The symptom was an AE_AML_OPERAND_TYPE during
initialization of the region/field:

  nsinit-0209: AE_AML_OPERAND_TYPE while getting region arguments
[DEBG]   ammonad-0284: Exec_monadic2_r/Not: bad operand(s)
(0x3005)

Fixed a problem where operators with more than one nested
subexpression would fail. The symptoms were varied, by mostly
AE_AML_OPERAND_TYPE errors. This was actually a rather serious
problem that has gone unnoticed until now.

  Subtract (Add (1,2), Multiply (3,4))

Fixed a problem where AcpiGetHandle didn’t quite get fixed in the
previous build (The prefix part of a relative path was handled
incorrectly).

Fixed a problem where Operation Region initialization failed if
the operation region name was a "namepath" instead of a simple
"nameseg". Symptom was an AE_NO_OPERAND error.

Fixed a problem where an assignment to a local variable via the
indirect RefOf mechanism only worked for the first such
assignment. Subsequent assignments were ignored.

Summary of changes for this label: 11_15_00

ACPI 2.0 table support with backwards support for ACPI 1.0 and the
0.71 extensions. Note: although we can read ACPI 2.0 BIOS tables,
the AML interpreter does NOT have support for the new 2.0 ASL
grammar terms at this time.

All ACPI hardware access is via the GAS structures in the ACPI 2.0
FADT.

All physical memory addresses across all platforms are now 64 bits
wide. Logical address width remains dependent on the platform
(i.e., "void *").

AcpiOsMapMemory interface changed to a 64-bit physical address.

14346 The AML interpreter integer size is now 64 bits, as per the ACPI
14347 2.0 specification.

14349 For backwards compatibility with ACPI 1.0, ACPI tables with a
14350 revision number less than 2 use 32-bit integers only.

14352 Fixed a problem where the evaluation of OpRegion operands did not
14353 always resolve them to numbers properly.

14355 --
14356 Summary of changes for this label: 10_20_00

14358 Fix for CBN_._STA issue. This fix will allow correct access to
14359 CBN_ OpRegions when the _STA returns 0x8.

14361 Support to convert ACPI constants (Ones, Zeros, One) to actual
14362 values before a package object is returned

14364 Fix for method call as predicate to if/while construct causing
14365 incorrect if/while behavior

14367 Fix for Else block package lengths sometimes calculated wrong (if
14368 block > 63 bytes)

14370 Fix for Processor object length field, was always zero

14372 Table load abort if FACP sanity check fails

14374 Fix for problem with Scope(name) if name already exists

14376 Warning emitted if a named object referenced cannot be found
14377 (resolved) during method execution.

14383 --
14384 Summary of changes for this label: 9_29_00

14386 New table initialization interfaces: AcpiInitializeSubsystem no
14387 longer has any parameters AcpiFindRootPointer - Find the RSDP (if
14388 necessary) AcpiLoadTables (RSDP) - load all tables found at RSDP-
14389 >RSDT Obsolete Interfaces AcpiLoadFirmwareTables - replaced by
14390 AcpiLoadTables

14392 Note: These interface changes require changes to all existing OSDs

14394 The PCI_Config default address space handler is always installed
14395 at the root namespace object.

14397 --
14398 Summary of changes for this label: 09_15_00

14400 The new initialization architecture is implemented. New
14401 interfaces are: AcpiInitializeSubsystem (replaces AcpiInitialize)
14402 AcpiEnableSubsystem Obsolete Interfaces: AcpiLoadNamespace

14404 (Namespace is automatically loaded when a table is loaded)

14406 The ACPI_OPERAND_OBJECT has been optimized to shrink its size from
14407 52 bytes to 32 bytes. There is usually one of these for every
14408 namespace object, so the memory savings is significant.

14410 Implemented just-in-time evaluation of the CreateField operators.

14412 Bug fixes for IA-64 support have been integrated.

14414 Additional code review comments have been implemented

14416 The so-called "third pass parse" has been replaced by a final walk
14417 through the namespace to initialize all operation regions (address
14418 spaces) and fields that have not yet been initialized during the
14419 execution of the various _INI and REG methods.

14421 New file - namespace/nsinit.c

14423 --
14424 Summary of changes for this label: 09_01_00

14426 Namespace manager data structures have been reworked to change the
14427 primary object from a table to a single object. This has
14428 resulted in dynamic memory savings of 3X within the namespace and
14429 2X overall in the ACPI CA subsystem.

14431 Fixed problem where the call to AcpiEvFindPciRootBuses was
14432 inadvertently left commented out.

14434 Reduced the warning count when generating the source with the GCC
14435 compiler.

14437 Revision numbers added to each module header showing the
14438 SourceSafe version of the file. Please refer to this version
14439 number when giving us feedback or comments on individual modules.

14441 The main object types within the subsystem have been renamed to
14442 clarify their purpose:

14444 ACPI_INTERNAL_OBJECT -> ACPI_OPERAND_OBJECT
14445 ACPI_GENERIC_OP -> ACPI_PARSE_OBJECT
14446 ACPI_NAME_TABLE_ENTRY -> ACPI_NAMESPACE_NODE

14448 NOTE: no changes to the initialization sequence are included in
14449 this label.

14451 --
14452 Summary of changes for this label: 08_23_00

14454 Fixed problem where TerminateControlMethod was being called
14455 multiple times per method

14457 Fixed debugger problem where single stepping caused a semaphore to
14458 be oversignalled

14460 Improved performance through additional parse object caching -
14461 added ACPI_EXTENDED_OP type

14463 --
14464 Summary of changes for this label: 08_10_00

14466 Parser/Interpreter integration: Eliminated the creation of
14467 complete parse trees for ACPI tables and control methods.
14468 Instead, parse subtrees are created and then deleted as soon as
14469 they are processed (Either entered into the namespace or executed
14470 by the interpreter). This reduces the use of dynamic kernel
14471 memory significantly. (about 10X)

14473 Exception codes broken into classes and renumbered. Be sure to
14474 recompile all code that includes acexcep.h. Hopefully we won't
14475 have to renumber the codes again now that they are split into
14476 classes (environment, programmer, AML code, ACPI table, and

internal).

Fixed some additional alignment issues in the Resource Manager
subcomponent

Implemented semaphore tracking in the AcpiExec utility, and fixed
several places where mutexes/semaphores were being unlocked
without a corresponding lock operation. There are no known
semaphore or mutex "leaks" at this time.

Fixed the case where an ASL Return operator is used to return an
unnamed package.

Summary of changes for this label: 07_28_00

Fixed a problem with the way addresses were calculated in
AcpiAmlReadFieldData() and AcpiAmlWriteFieldData(). This problem
manifested itself when a Field was created with WordAccess or
DwordAccess, but the field unit defined within the Field was less

than a Word or Dword.

Fixed a problem in AmlDumpOperands() module's loop to pull
operands off of the operand stack to display information. The
problem manifested itself as a TLB error on 64-bit systems when
accessing an operand stack with two or more operands.

Fixed a problem with the PCI configuration space handlers where
context was getting confused between accesses. This required a
change to the generic address space handler and address space
setup definitions. Handlers now get both a global handler context
(this is the one passed in by the user when executing
AcpiInstallAddressSpaceHandler() and a specific region context
that is unique to each region (For example, the _ADR, _SEG and
_BBN values associated with a specific region). The generic
function definitions have changed to the following:

typedef ACPI_STATUS (*ADDRESS_SPACE_HANDLER) (UINT32 Function,
UINT32 Address, UINT32 BitWidth, UINT32 *Value, void
*HandlerContext, // This used to be void *Context void
*RegionContext); // This is an additional parameter

typedef ACPI_STATUS (*ADDRESS_SPACE_SETUP) (ACPI_HANDLE
RegionHandle, UINT32 Function, void *HandlerContext, void
**RegionContext); // This used to be **ReturnContext

Summary of changes for this label: 07_21_00

Major file consolidation and rename. All files within the
interpreter have been renamed as well as most header files. This
was done to prevent collisions with existing files in the host
OSs -- filenames such as "config.h" and "global.h" seem to be
quite common. The VC project files have been updated. All
makefiles will require modification.

The parser/interpreter integration continues in Phase 5 with the
implementation of a complete 2-pass parse (the AML is parsed
twice) for each table; This avoids the construction of a huge
parse tree and therefore reduces the amount of dynamic memory
required by the subsystem. Greater use of the parse object cache
means that performance is unaffected.

Many comments from the two code reviews have been rolled in.

The 64-bit alignment support is complete.

Summary of changes for this label: 06_30_00

With a nod and a tip of the hat to the technology of yesteryear,
we've added support in the source code for 80 column output
devices. The code is now mostly constrained to 80 columns or
less to support environments and editors that 1) cannot display
or print more than 80 characters on a single line, and 2) cannot
disable line wrapping.

A major restructuring of the namespace data structure has been
completed. The result is 1) cleaner and more
understandable/maintainable code, and 2) a significant reduction
in the dynamic memory requirement for each named ACPI object
(almost half).

Summary of changes for this label: 06_23_00

Linux support has been added. In order to obtain approval to get
the ACPI CA subsystem into the Linux kernel, we've had to make
quite a few changes to the base subsystem that will affect all
users (all the changes are generic and OS- independent). The
effects of these global changes have been somewhat far reaching.
Files have been merged and/or renamed and interfaces have been
renamed. The major changes are described below.

Osd* interfaces renamed to AcpiOs* to eliminate namespace
pollution/confusion within our target kernels. All OSD
interfaces must be modified to match the new naming convention.

Files merged across the subsystem. A number of the smaller source
and header files have been merged to reduce the file count and
increase the density of the existing files. There are too many
to list here. In general, makefiles that call out individual
files will require rebuilding.

Interpreter files renamed. All interpreter files now have the
prefix am* instead of ie* and is*.

Header files renamed: The acapi.h file is now acpixf.h. The
acpiosd.h file is now acpiosxf.h. We are removing references to
the acronym "API" since it is somewhat windowsy. The new name is
"external interface" or xface or xf in the filenames.j

All manifest constants have been forced to upper case (some were
mixed case.) Also, the string "ACPI_" has been prepended to many
(not all) of the constants, typedefs, and structs.

The globals "DebugLevel" and "DebugLayer" have been renamed
"AcpiDbgLevel" and "AcpiDbgLayer" respectively.

All other globals within the subsystem are now prefixed with
"AcpiGbl_" Internal procedures within the subsystem are now
prefixed with "Acpi" (with only a few exceptions). The original
two-letter abbreviation for the subcomponent remains after "Acpi"
- for example, CmCallocate became AcpiCmCallocate.

Added a source code translation/conversion utility. Used to
generate the Linux source code, it can be modified to generate
other types of source as well. Can also be used to cleanup
existing source by removing extraneous spaces and blank lines.
Found in tools/acpisrc/*

OsdUnMapMemory was renamed to OsdUnmapMemory and then
AcpiOsUnmapMemory. (UnMap became Unmap).

A "MaxUnits" parameter has been added to AcpiOsCreateSemaphore.
When set to one, this indicates that the caller wants to use the

semaphore as a mutex, not a counting semaphore. ACPI CA uses
both types. However, implementers of this call may want to use
different OS primitives depending on the type of semaphore
requested. For example, some operating systems provide separate

"mutex" and "semaphore" interfaces - where the mutex interface is
much faster because it doesn't have all the overhead of a full
semaphore implementation.

Fixed a deadlock problem where a method that accesses the PCI
address space can block forever if it is the first access to the
space.

Summary of changes for this label: 06_02_00

Support for environments that cannot handle unaligned data
accesses (e.g. firmware and OS environments devoid of alignment
handler technology namely SAL/EFI and the IA-64 Linux kernel) has
been added (via configurable macros) in these three areas: -
Transfer of data from the raw AML byte stream is done via byte
moves instead of word/dword/qword moves. - External objects are
aligned within the user buffer, including package elements (sub-
objects). - Conversion of name strings to UINT32 Acpi Names is now
done byte-wise.

The Store operator was modified to mimic Microsoft's
implementation when storing to a Buffer Field.

Added a check of the BM_STS bit before entering C3.

The methods subdirectory has been obsoleted and removed. A new
file, cmeval.c subsumes the functionality.

A 16-bit (DOS) version of AcpiExec has been developed. The
makefile is under the acpiexec directory.

```

741  *              Flags               - To be passed to the external object
742  *
743  * RETURN:      Status
744  *
745  * DESCRIPTION: Common low-level function to insert a new name into the global
746  *              list of Externals which will in turn be later emitted as
747  *              External() declarations in the disassembled output.
748  *
749  *              Note: The external name should not include a root prefix
750  *              (backslash). We do not want External() statements to contain
751  *              a leading '\', as this prevents duplicate external statements
752  *              of the form:
753  *
754  *                  External (\ABCD)
755  *                  External (ABCD)
756  *
757  *              This would cause a compile time error when the disassembled
758  *              output file is recompiled.
759  *
760  *              There are two cases that are handled here. For both, we emit
761  *              an External() statement:
762  *              1) The name was simply not found in the namespace.
763  *              2) The name was found, but it originated in a table other than
764  *              the table that is being disassembled.

1173  ******************************************************************************/
1174
1175 #if 0
1176 Summary of the external control method problem:
1177
1178 When the -e option is used with disassembly, the various SSDTs are simply
1179 loaded into a global namespace for the disassembler to use in order to
1180 resolve control method references (invocations).
```

```
The disassembler tracks any such references, and will emit an External()
statement for these types of methods, with the proper number of arguments .

Without the SSDTs, the AML does not contain enough information to properly
disassemble the control method invocation -- because the disassembler does
not know how many arguments to parse.

An example: Assume we have two control methods. ABCD has one argument, and
EFGH has zero arguments. Further, we have two additional control methods
that invoke ABCD and EFGH, named T1 and T2:

    Method (ABCD, 1)
    {
    }
    Method (EFGH, 0)
    {
    }
    Method (T1)
    {
        ABCD (Add (2, 7, Local0))
    }
    Method (T2)
    {
        EFGH ()
        Add (2, 7, Local0)
    }

Here is the AML code that is generated for T1 and T2:

     185:      Method (T1)

0000034C:  14 10 54 31 5F 5F 00 ...    "..T1__."

     186:      {
     187:          ABCD (Add (2, 7, Local0))

00000353:  41 42 43 44 .............    "ABCD"
00000357:  72 0A 02 0A 07 60 ......    "r....`"

     188:      }

     190:      Method (T2)

0000035D:  14 10 54 32 5F 5F 00 ...    "..T2__."

     191:      {
     192:          EFGH ()

00000364:  45 46 47 48 .............    "EFGH"

     193:          Add (2, 7, Local0)

00000368:  72 0A 02 0A 07 60 ......    "r....`"
     194:      }

Note that the AML code for T1 and T2 is essentially identical. When
disassembling this code, the methods ABCD and EFGH must be known to the
disassembler, otherwise it does not know how to handle the method invocations.

In other words, if ABCD and EFGH are actually external control methods
appearing in an SSDT, the disassembler does not know what to do unless
the owning SSDT has been loaded via the -e option.

        ACPI_MODULE_NAME    ("dmtbinfo")

/*
 * How to add a new table:
 *
 * - Add the C table definition to the actbl1.h or actbl2.h header.
 * - Add ACPI_xxxx_OFFSET macro(s) for the table (and subtables) to list below.
 * - Define the table in this file (for the disassembler). If any
 *   new data types are required (ACPI_DMT_*), see below.
```

```
 * - Add an external declaration for the new table definition (AcpiDmTableInfo*)
 *     in acdisam.h
 * - Add new table definition to the dispatch table in dmtable.c (AcpiDmTableDat
 *     If a simple table (with no subtables), no disassembly code is needed.
 *     Otherwise, create the AcpiDmDump* function for to disassemble the table
 *     and add it to the dmtbdump.c file.
 * - Add an external declaration for the new AcpiDmDump* function in acdisasm.h
 * - Add the new AcpiDmDump* function to the dispatch table in dmtable.c
 * - Create a template for the new table
 * - Add data table compiler support
 *
 * How to add a new data type (ACPI_DMT_*):
 *
 * - Add new type at the end of the ACPI_DMT list in acdisasm.h
 * - Add length and implementation cases in dmtable.c  (disassembler)
 * - Add type and length cases in dtutils.c (DT compiler)

 * Blocks, Data, and Opcodes
 */

/*
 * Note concerning support for "module-level code".
 *
 * ACPI 1.0 allowed Type1 and Type2 executable opcodes outside of control
 * methods (the so-called module-level code.) This support was explicitly
 * removed in ACPI 2.0, but this type of code continues to be created by
 * BIOS vendors. In order to support the disassembly and recompilation of
 * such code (and the porting of ASL code to iASL), iASL supports this
 * code in violation of the current ACPI specification.
 *
 * The grammar change to support module-level code is to revert the
 * {ObjectList} portion of the DefinitionBlockTerm in ACPI 2.0 to the
 * original use of {TermList} instead (see below.) This allows the use
 * of Type1 and Type2 opcodes at module level.
 */

531  *
532  * FUNCTION:    OpcDoEisaId
533  *
534  * PARAMETERS:  Op        - Parse node
535  *
536  * RETURN:      None
537  *
538  * DESCRIPTION: Convert a string EISA ID to numeric representation. See the
539  *              Pnp BIOS Specification for details. Here is an excerpt:
540  *
541  *              A seven character ASCII representation of the product
542  *              identifier compressed into a 32-bit identifier. The seven
543  *              character ID consists of a three character manufacturer code,
544  *              a three character hexadecimal product identifier, and a one
545  *              character hexadecimal revision number. The manufacturer code
546  *              is a 3 uppercase character code that is compressed into 3 5-bit
547  *              values as follows:
548  *                  1) Find hex ASCII value for each letter
549  *                  2) Subtract 40h from each ASCII value
550  *                  3) Retain 5 least significant bits for each letter by
551  *                     discarding upper 3 bits because they are always 0.
552  *                  4) Compressed code = concatenate 0 and the 3 5-bit values
553  *
554  *              The format of the compressed product identifier is as follows:
555  *              Byte 0: Bit 7       - Reserved (0)
556  *                      Bits 6-2:   - 1st character of compressed mfg code
557  *                      Bits 1-0    - Upper 2 bits of 2nd character of mfg code
558  *              Byte 1: Bits 7-5    - Lower 3 bits of 2nd character of mfg code
559  *                      Bits 4-0    - 3rd character of mfg code
560  *              Byte 2: Bits 7-4    - 1st hex digit of product number
561  *                      Bits 3-0    - 2nd hex digit of product number
562  *              Byte 3: Bits 7-4    - 3st hex digit of product number
563  *                      Bits 3-0    - Hex digit of the revision number
