/*******************************************************************************
```

```
 *
 * FUNCTION:    AcpiExResolveNodeToValue
 *
 * PARAMETERS:  ObjectPtr       - Pointer to a location that contains
 *                                a pointer to a NS node, and will receive a
 *                                pointer to the resolved object.
 *              WalkState       - Current state. Valid only if executing AML
 *                                code. NULL if simply resolving an object
 *
 * RETURN:      Status
 *
 * DESCRIPTION: Resolve a Namespace node to a valued object
 *
 * Note: for some of the data types, the pointer attached to the Node
 * can be either a pointer to an actual internal object or a pointer into the
 * AML stream itself. These types are currently:
 *
 *      ACPI_TYPE_INTEGER
 *      ACPI_TYPE_STRING
 *      ACPI_TYPE_BUFFER
 *      ACPI_TYPE_MUTEX
 *      ACPI_TYPE_PACKAGE
 *
 ******************************************************************************/

 *
 * FUNCTION:    AcpiExResolveOperands
 *
 * PARAMETERS:  Opcode              - Opcode being interpreted
 *              StackPtr            - Pointer to the operand stack to be
 *                                    resolved
 *              WalkState           - Current state
 *
 * RETURN:      Status
 *
 * DESCRIPTION: Convert multiple input operands to the types required by the
 *              target operator.
 *
 *      Each 5-bit group in ArgTypes represents one required
 *      operand and indicates the required Type. The corresponding operand
 *      will be converted to the required type if possible, otherwise we
 *      abort with an exception.
 *

383  *
384  * FUNCTION:    AcpiExStoreObjectToNode
385  *
386  * PARAMETERS:  SourceDesc              - Value to be stored
387  *              Node                    - Named object to receive the value
388  *              WalkState               - Current walk state
389  *              ImplicitConversion      - Perform implicit conversion (yes/no)
390  *
391  * RETURN:      Status
392  *
393  * DESCRIPTION: Store the object to the named object.
394  *
395  *              The Assignment of an object to a named object is handled here
396  *              The value passed in will replace the current value (if any)
397  *              with the input value.
398  *
399  *              When storing into an object the data is converted to the
400  *              target object type then stored in the object. This means
401  *              that the target object type (for an initialized target) will
402  *              not be changed by a store operation. A CopyObject can change
403  *              the target type, however.
403  *              not be changed by a store operation.
404  *
405  *              The ImplicitConversion flag is set to NO/FALSE only when
406  *              storing to an ArgX -- as per the rules of the ACPI spec.
407  *
408  *              Assumes parameters are already validated.

165  *
166  * FUNCTION:    AcpiExStoreObjectToObject
167  *
168  * PARAMETERS:  SourceDesc          - Object to store
169  *              DestDesc            - Object to receive a copy of the source
170  *              NewDesc             - New object if DestDesc is obsoleted
171  *              WalkState           - Current walk state
172  *
173  * RETURN:      Status
174  *
175  * DESCRIPTION: "Store" an object to another object. This may include
176  *              converting the source type to the target type (implicit
177  *              conversion), and a copy of the value of the source to
178  *              the target.
179  *
180  *              The Assignment of an object to another (not named) object
181  *              is handled here.
182  *              The Source passed in will replace the current value (if any)
183  *              with the input value.
184  *
```

```
185  *              When storing into an object the data is converted to the
186  *              target object type then stored in the object. This means
187  *              that the target object type (for an initialized target) will
188  *              not be changed by a store operation.
189  *
190  *              This module allows destination types of Number, String,
191  *              Buffer, and Package.
192  *
193  *              Assumes parameters are already validated. NOTE: SourceDesc
194  *              resolution (from a reference object) must be performed by
195  *              the caller if necessary.

135  *
136  * FUNCTION:    AcpiGetTimerDuration
137  *
138  * PARAMETERS:  StartTicks          - Starting timestamp
139  *              EndTicks            - End timestamp
140  *              TimeElapsed         - Where the elapsed time is returned
141  *
142  * RETURN:      Status and TimeElapsed
143  *
144  * DESCRIPTION: Computes the time elapsed (in microseconds) between two
145  *              PM Timer time stamps, taking into account the possibility of
146  *              rollovers, the timer resolution, and timer frequency.
147  *
148  *              The PM Timer's clock ticks at roughly 3.6 times per
149  *              _microsecond_, and its clock continues through Cx state
150  *              transitions (unlike many CPU timestamp counters) -- making it
151  *              a versatile and accurate timer.
152  *
153  *              Note that this function accommodates only a single timer
154  *              rollover. Thus for 24-bit timers, this function should only
155  *              be used for calculating durations less than ~4.6 seconds
156  *              (~20 minutes for 32-bit timers) -- calculations below:
157  *
158  *              2**24 Ticks / 3,600,000 Ticks/Sec = 4.66 sec
159  *              2**32 Ticks / 3,600,000 Ticks/Sec = 1193 sec or 19.88 minutes
160  *

#if (!ACPI_REDUCED_HARDWARE)
/*******************************************************************************
 *
 * FUNCTION:    AcpiReadBitRegister
 *
 * PARAMETERS:  RegisterId      - ID of ACPI Bit Register to access
 *              ReturnValue     - Value that was read from the register,
 *                                normalized to bit position zero.
 *
 * RETURN:      Status and the value read from the specified Register. Value
 *              returned is normalized to bit0 (is shifted all the way right)
 *
 * DESCRIPTION: ACPI BitRegister read function. Does not acquire the HW lock.
 *
 * SUPPORTS:    Bit fields in PM1 Status, PM1 Enable, PM1 Control, and
 *              PM2 Control.
 *
 * Note: The hardware lock is not required when reading the ACPI bit registers
 *       since almost all of them are single bit and it does not matter that
 *       the parent hardware register can be split across two physical
 *       registers. The only multi-bit field is SLP_TYP in the PM1 control
 *       register, but this field does not cross an 8-bit boundary (nor does
 *       it make much sense to actually read this field.)
 *

497  *
498  * FUNCTION:    AcpiGetSleepTypeData
499  *
500  * PARAMETERS:  SleepState          - Numeric sleep state
501  *              *SleepTypeA         - Where SLP_TYPa is returned
502  *              *SleepTypeB         - Where SLP_TYPb is returned
503  *
504  * RETURN:      Status
517  * RETURN:      Status - ACPI status
505  *
506  * DESCRIPTION: Obtain the SLP_TYPa and SLP_TYPb values for the requested
507  *              sleep state via the appropriate \_Sx object.
519  * DESCRIPTION: Obtain the SLP_TYPa and SLP_TYPb values for the requested sleep
520  *              state.
508  *
509  *  The sleep state package returned from the corresponding \_Sx_ object
510  *  must contain at least one integer.
511  *
512  *  March 2005:
513  *  Added support for a package that contains two integers. This
514  *  goes against the ACPI specification which defines this object as a
515  *  package with one encoded DWORD integer. However, existing practice
516  *  by many BIOS vendors is to return a package with 2 or more integer
517  *  elements, at least one per sleep type (A/B).
518  *
519  *  January 2013:
520  *  Therefore, we must be prepared to accept a package with either a
521  *  single integer or multiple integers.
522  *
523  *  The single integer DWORD format is as follows:
524  *      BYTE 0 - Value for the PM1A SLP_TYP register
525  *      BYTE 1 - Value for the PM1B SLP_TYP register
526  *      BYTE 2-3 - Reserved
527  *
528  *  The dual integer format is as follows:
529  *      Integer 0 - Value for the PM1A SLP_TYP register
530  *      Integer 1 - Value for the PM1A SLP_TYP register
531  *

```
 * specification. The need for this code is dictated by the many machines that
 * return incorrect types for the standard predefined methods. Performing these
 * conversions here, in one place, eliminates the need for individual ACPI
 * device drivers to do the same. Note: Most of these conversions are different
 * than the internal object conversion routines used for implicit object
 * conversion.
 *
 * The following conversions can be performed as necessary:
 *
 * Integer -> String
 * Integer -> Buffer
 * String  -> Integer
 * String  -> Buffer
 * Buffer  -> Integer
 * Buffer  -> String
 * Buffer  -> Package of Integers
 * Package -> Package of one Package
 *
 * Additional conversions that are available:
 *  Convert a null return or zero return value to an EndTag descriptor
 *  Convert an ASCII string to a Unicode buffer
 *
 * An incorrect standalone object is wrapped with required outer package
 *
 * Additional possible repairs:
 * Required package elements that are NULL replaced by Integer/String/Buffer
 *

570  * DESCRIPTION: Repair a common problem with objects that are defined to
571  *              return a variable-length Package of sub-objects. If there is
572  *              only one sub-object, some BIOS code mistakenly simply declares
573  *              the single object instead of a Package with one sub-object.
574  *              This function attempts to repair this error by wrapping a
575  *              Package object around the original object, creating the
576  *              correct and expected Package with one sub-object.
577  *
578  *              Names that can be repaired in this manner include:
579  *              _ALR, _CSD, _HPX, _MLS, _PLD, _PRT, _PSS, _TRT, _TSS,
580  *              _BCL, _DOD, _FIX, _Sx
581  *

  67 /******************************************************************************
  68  *
  69  * FUNCTION:    AcpiNsSearchOneScope
  70  *
  71  * PARAMETERS:  TargetName      - Ascii ACPI name to search for
  72  *              ParentNode      - Starting node where search will begin
  73  *              Type            - Object type to match
  74  *              ReturnNode      - Where the matched Named obj is returned
  75  *
  76  * RETURN:      Status
  77  *
  78  * DESCRIPTION: Search a single level of the namespace. Performs a
  79  *              simple search of the specified level, and does not add
  80  *              entries or search parents.
  81  *
  82  *
  83  *      Named object lists are built (and subsequently dumped) in the
  84  *      order in which the names are encountered during the namespace load;
  85  *
  86  *      All namespace searching is linear in this implementation, but
  87  *      could be easily modified to support any improved search
  88  *      algorithm. However, the linear search was chosen for simplicity
  89  *      and because the trees are small and the other interpreter
  90  *      execution overhead is relatively high.
  91  *
  92  *      Note: CPU execution analysis has shown that the AML interpreter spends
  93  *      a very small percentage of its time searching the namespace. Therefore,
  94  *      the linear search seems to be sufficient, as there would seem to be
  95  *      little value in improving the search.

578  *
579  * FUNCTION:    AcpiWalkNamespace
580  *
581  * PARAMETERS:  Type                - ACPI_OBJECT_TYPE to search for
582  *              StartObject         - Handle in namespace where search begins
583  *              MaxDepth            - Depth to which search is to reach
584  *              DescendingCallback  - Called during tree descent
475  *              PreOrderVisit       - Called during tree pre-order visit
585  *                                    when an object of "Type" is found
586  *              AscendingCallback   - Called during tree ascent
477  *              PostOrderVisit      - Called during tree post-order visit
587  *                                    when an object of "Type" is found
588  *              Context             - Passed to user function(s) above
589  *              ReturnValue         - Location where return value of
590  *                                    UserFunction is put if terminated early
591  *
592  * RETURNS      Return value from the UserFunction if terminated early.
593  *              Otherwise, returns NULL.
594  *
595  * DESCRIPTION: Performs a modified depth-first walk of the namespace tree,
596  *              starting (and ending) at the object specified by StartHandle.
597  *              The callback function is called whenever an object that matches
598  *              the type parameter is found. If the callback function returns
599  *              a non-zero value, the search is terminated immediately and this
600  *              value is returned to the caller.
601  *
602  *              The point of this procedure is to provide a generic namespace
603  *              walk routine that can be called from multiple places to
604  *              provide multiple services; the callback function(s) can be
605  *              tailored to each task, whether it is a print function,
606  *              a compare function, etc.

250  *
251  * FUNCTION:    AcpiTbSelectAddress
252  *
253  * PARAMETERS:  RegisterName        - ASCII name of the ACPI register
254  *              Address32           - 32-bit address of the register
255  *              Address64           - 64-bit address of the register
256  *
257  * RETURN:      The resolved 64-bit address
```

```
 *
 * DESCRIPTION: Select between 32-bit and 64-bit versions of addresses within
 *              the FADT. Used for the FACS and DSDT addresses.
 *
 * NOTES:
 *
 * Check for FACS and DSDT address mismatches. An address mismatch between
 * the 32-bit and 64-bit address fields (FIRMWARE_CTRL/X_FIRMWARE_CTRL and
 * DSDT/X_DSDT) could be a corrupted address field or it might indicate
 * the presence of two FACS or two DSDT tables.
 *
 * November 2013:
 * By default, as per the ACPICA specification, a valid 64-bit address is
 * used regardless of the value of the 32-bit address. However, this
 * behavior can be overridden via the AcpiGbl_Use32BitFadtAddresses flag.
 *

/******************************************************************************
 *
 * FUNCTION:    AcpiTbConvertFadt
 *
 * PARAMETERS:  None - AcpiGbl_FADT is used.
 *
 * RETURN:      None
 *
 * DESCRIPTION: Converts all versions of the FADT to a common internal format.
 *              Expand 32-bit addresses to 64-bit as necessary. Also validate
 *              important fields within the FADT.
 *
 * NOTE:        AcpiGbl_FADT must be of size (ACPI_TABLE_FADT), and must
```

```
 *              contain a copy of the actual BIOS-provided FADT.
 *
 * Notes on 64-bit register addresses:
 *
 * After this FADT conversion, later ACPICA code will only use the 64-bit "X"
 * fields of the FADT for all ACPI register addresses.
 *
 * The 64-bit X fields are optional extensions to the original 32-bit FADT
 * V1.0 fields. Even if they are present in the FADT, they are optional and
 * are unused if the BIOS sets them to zero. Therefore, we must copy/expand
 * 32-bit V1.0 fields to the 64-bit X fields if the the 64-bit X field is
 * originally zero.
 *
 * For ACPI 1.0 FADTs (that contain no 64-bit addresses), all 32-bit address
 * fields are expanded to the corresponding 64-bit X fields in the internal
 * common FADT.
 *
 * For ACPI 2.0+ FADTs, all valid (non-zero) 32-bit address fields are expanded
 * to the corresponding 64-bit X fields, if the 64-bit field is originally
 * zero. Adhering to the ACPI specification, we completely ignore the 32-bit
 * field if the 64-bit field is valid, regardless of whether the host OS is
 * 32-bit or 64-bit.
 *
 * Possible additional checks:
 *  (AcpiGbl_FADT.Pm1EventLength >= 4)
 *  (AcpiGbl_FADT.Pm1ControlLength >= 2)
 *  (AcpiGbl_FADT.PmTimerLength >= 4)
 *  Gpe block lengths must be multiple of 2
 *

/*******************************************************************************
 *
 * FUNCTION:    AcpiReleaseMutex
 *
 * PARAMETERS:  Handle              - Mutex or prefix handle (optional)
 *              Pathname            - Mutex pathname (optional)
 *
 * RETURN:      Status
 *
 * DESCRIPTION: Release an AML mutex. This is a device driver interface to
 *              AML mutex objects, and allows for transaction locking between
 *              drivers and AML code. The mutex node is pointed to by
 *              Handle:Pathname. Either Handle or Pathname can be NULL, but
 *              not both.
 *
 ******************************************************************************/

/******************************************************************************
 *
 * Return Package types
 *
 * 1) PTYPE1 packages do not contain sub-packages.
 *
 * ACPI_PTYPE1_FIXED: Fixed-length length, 1 or 2 object types:
 *      object type
 *      count
 *      object type
 *      count
 *
 * ACPI_PTYPE1_VAR: Variable-length length. Zero-length package is allowed:
```

```
 *      object type (Int/Buf/Ref)
 *
 * ACPI_PTYPE1_OPTION: Package has some required and some optional elements
 *      (Used for _PRW)
 *
 *
 * 2) PTYPE2 packages contain a Variable-length number of sub-packages. Each
 *    of the different types describe the contents of each of the sub-packages.
 *
 * ACPI_PTYPE2: Each subpackage contains 1 or 2 object types. Zero-length
 *      parent package is allowed:
 *      object type
 *      count
 *      object type
 *      count
 *      (Used for _ALR,_MLS,_PSS,_TRT,_TSS)
 *
 * ACPI_PTYPE2_COUNT: Each subpackage has a count as first element.
 *      Zero-length parent package is allowed:
 *      object type
 *      (Used for _CSD,_PSD,_TSD)
 *
 * ACPI_PTYPE2_PKG_COUNT: Count of subpackages at start, 1 or 2 object types:
 *      object type
 *      count
 *      object type
 *      count
 *      (Used for _CST)
 *
 * ACPI_PTYPE2_FIXED: Each subpackage is of Fixed-length. Zero-length
 *      parent package is allowed.
 *      (Used for _PRT)
 *
 * ACPI_PTYPE2_MIN: Each subpackage has a Variable-length but minimum length.
 *      Zero-length parent package is allowed:
 *      (Used for _HPX)
 *
 * ACPI_PTYPE2_REV_FIXED: Revision at start, each subpackage is Fixed-length
 *      (Used for _ART, _FPS)
 *
 * ACPI_PTYPE2_FIX_VAR: Each subpackage consists of some fixed-length elements
 *      followed by an optional element. Zero-length parent package is allowed.
 *      object type
 *      count
 *      object type
 *      count = 0 (optional)
 *      (Used for _DLM)
 *

#ifdef ACPI_CREATE_PREDEFINED_TABLE
/******************************************************************************
 *
 * Predefined method/object information table.
 *
 * These are the names that can actually be evaluated via AcpiEvaluateObject.
 * Not present in this table are the following:
 *
 *      1) Predefined/Reserved names that are never evaluated via
 *         AcpiEvaluateObject:
 *              _Lxx and _Exx GPE methods
 *              _Qxx EC methods
 *              _T_x compiler temporary variables
 *              _Wxx wake events
 *
 *      2) Predefined names that never actually exist within the AML code:
 *              Predefined resource descriptor field names
 *
 *      3) Predefined names that are implemented within ACPICA:
 *              _OSI
 *
 * The main entries in the table each contain the following items:
 *
 * Name                 - The ACPI reserved name
 * ArgumentList         - Contains (in 16 bits), the number of required
 *                        arguments to the method (3 bits), and a 3-bit type
 *                        field for each argument (up to 4 arguments). The
```

```
 *                        METHOD_?ARGS macros generate the correct packed data.
 * ExpectedBtypes       - Allowed type(s) for the return value.
 *                        0 means that no return value is expected.
 *
 * For methods that return packages, the next entry in the table contains
 * information about the expected structure of the package. This information
 * is saved here (rather than in a separate table) in order to minimize the
 * overall size of the stored data.
 *
 * Note: The additional braces are intended to promote portability.
 *
 * Note2: Table is used by the kernel-resident subsystem, the iASL compiler,
 * and the AcpiHelp utility.
 *
 * TBD: _PRT - currently ignore reversed entries. Attempt to fix in nsrepair.
 * Possibly fixing package elements like _BIF, etc.
 *
