936  * Release a temporary hold for the given dataset object and tag.
937 */
938 int
939 dsl_pool_user_release(dsl_pool_t *dp, uint64_t dsobj, const char *tag,
940                       dmu_tx_t *tx)
941 {
942     return (dsl_pool_user_hold_rele_impl(dp, dsobj, tag, NULL,
943                                         tx, B_FALSE));
944 }

946 /*
947  * DSL Pool Configuration Lock
948 */
949 * The dp_config_rwlock protects against changes to DSL state (e.g. dataset
```

2

```

950 * creation / destruction / rename / property setting). It must be held for
951 * read to hold a dataset or dsl_dir. I.e. you must call
952 * dsl_pool_config_enter() or dsl_pool_hold() before calling
953 * dsl_{dataset,dir}_hold{_obj}. In most circumstances, the dp_config_rwlock
954 * must be held continuously until all datasets and dsl_dirs are released.
955 *
956 * The only exception to this rule is that if a "long hold" is placed on
957 * a dataset, then the dp_config_rwlock may be dropped while the dataset
958 * is still held. The long hold will prevent the dataset from being
959 * destroyed -- the destroy will fail with EBUSY. A long hold can be
960 * obtained by calling dsl_dataset_long_hold(), or by "owning" a dataset
961 * (by calling dsl_{dataset,objset}_{try}own_{obj}).
962 *
963 * Legitimate long-holders (including owners) should be long-running, cancelable
964 * tasks that should cause "zfs destroy" to fail. This includes DMU
965 * consumers (i.e. a ZPL filesystem being mounted or ZVOL being open),
966 * "zfs send", and "zfs diff". There are several other long-holders whose
967 * uses are suboptimal (e.g. "zfs promote", and zil_suspend()).
968 *
969 * The usual formula for long-holding would be:
970 * dsl_pool_hold()
971 * dsl_dataset_hold()
972 * ... perform checks ...
973 * dsl_dataset_long_hold()
974 * dsl_pool_rele()
975 * ... perform long-running task ...
976 * dsl_dataset_long_rele()
977 * dsl_dataset_rele()
978 *
979 * Note that when the long hold is released, the dataset is still held but
980 * the pool is not held. The dataset may change arbitrarily during this time
981 * (e.g. it could be destroyed). Therefore you shouldn't do anything to the
982 * dataset except release it.
983 *
984 * User-initiated operations (e.g. ioctl, zfs_ioc_*) are either read-only
985 * or modifying operations.
986 *
987 * Modifying operations should generally use dsl_sync_task(). The synctask
988 * infrastructure enforces proper locking strategy with respect to the
989 * dp_config_rwlock. See the comment above dsl_sync_task() for details.
990 *
991 * Read-only operations will manually hold the pool, then the dataset, obtain
992 * information from the dataset, then release the pool and dataset.
993 * dmu_objset_{hold,rele}() are convenience routines that also do the pool
994 * hold/rele.
995 */
