63
64 /* X509_REQ_INFO is handled in an unusual way to get round
65  * invalid encodings. Some broken certificate requests don't
66  * encode the attributes field if it is empty. This is in
67  * violation of PKCS#10 but we need to tolerate it. We do
68  * this by making the attributes field OPTIONAL then using
69  * the callback to initialise it to an empty STACK.
70  *
71  * This means that the field will be correctly encoded unless
72  * we NULL out the field.
73  *
74  * As a result we no longer need the req_kludge field because
75  * the information is now contained in the attributes field:
76  * 1. If it is NULL then it's the invalid omission.
77  * 2. If it is empty it is the correct encoding.
78  * 3. If it is not empty then some attributes are present.

838          * some platforms socklen_t is int and on some size_t. So what
839          * one can do? One can cook #ifdef spaghetti, which is nothing
840          * but masochistic. Or one can do union between int and size_t.
841          * One naturally does it primarily for 64-bit platforms where
842          * sizeof(int) != sizeof(size_t). But would it work? Note that
843          * if size_t member is initialized to 0, then later int member
844          * assignment naturally does the job on little-endian platforms
845          * regardless accept's expectations! What about big-endians?
846          * If accept expects int*, then it works, and if size_t*, then
847          * length value would appear as unreasonably large. But this
848          * won't prevent it from filling in the address structure. The
849          * trouble of course would be if accept returns more data than
850          * actual buffer can accommodate and overwrite stack... That's
851          * where early OPENSSL_assert comes into picture. Besides, the
852          * only 64-bit big-endian platform found so far that expects
853          * size_t* is HP-UX, where stack grows towards higher address.

```

55 /*
56  * Why BIO_s_log?
57  *
58  * BIO_s_log is useful for system daemons (or services under NT).
59  * It is one-way BIO, it sends all stuff to syslogd (on system that
60  * commonly use that), or event log (on NT), or OPCOM (on OpenVMS).

69 /* TODO list
70 *
71 * 1. Check a bunch of "(words+1)" type hacks in various bignum functions and
72 * check they can be safely removed.
73 * - Check +1 and other ugliness in BN_from_montgomery()
74 *
75 * 2. Consider allowing a BN_new_ex() that, at least, lets you specify an
76 * appropriate 'block' size that will be honoured by bn_expand_internal() to
77 * prevent piddly little reallocations. OTOH, profiling bignum expansions in
78 * BN_CTX doesn't show this to be a big issue.

new/usr/src/lib/openssl/libsunw_crypto/bn/x86_64-gcc.c
4853 illumos-gate is not lint-clean when built with openssl 1.0

```
1 #include <bn_lcl.h>
2 #if !(defined(__GNUC__) && __GNUC__>=2)
3 # include "bn_asm.c" /* kind of dirty hack for Sun Studio */
4 #else
5 /*
6  * x86_64 BIGNUM accelerator version 0.1, December 2002.
7  *
8  * Implemented by Andy Polyakov <appro@fy.chalmers.se> for the OpenSSL
9  * project.
10 *
11 * Rights for redistribution and usage in source and binary forms are
12 * granted according to the OpenSSL license. Warranty of any kind is
13 * disclaimed.
14 *
15 * Q. Version 0.1? It doesn't sound like Andy, he used to assign real
16 * versions, like 1.0...
17 * A. Well, that's because this code is basically a quick-n-dirty
18 * proof-of-concept hack. As you can see it's implemented with
19 * inline assembler, which means that you're bound to GCC and that
20 * there might be enough room for further improvement.
21 *
22 * Q. Why inline assembler?
23 * A. x86_64 features own ABI which I'm not familiar with. This is
24 * why I decided to let the compiler take care of subroutine
25 * prologue/epilogue as well as register allocation. For reference.
26 * Win64 implements different ABI for AMD64, different from Linux.
27 *
28 * Q. How much faster does it get?
29 * A. 'apps/openssl speed rsa dsa' output with no-asm:
30 *
31 *          sign    verify    sign/s verify/s
32 *  rsa 512 bits 0.0006s 0.0001s 1683.8 18456.2
33 *  rsa 1024 bits 0.0028s 0.0002s 356.0 6407.0
34 *  rsa 2048 bits 0.0172s 0.0005s 58.0 1957.8
35 *  rsa 4096 bits 0.1155s 0.0018s 8.7 555.6
36 *          sign    verify    sign/s verify/s
37 *  dsa 512 bits 0.0005s 0.0006s 2100.8 1768.3
38 *  dsa 1024 bits 0.0014s 0.0018s 692.3 559.2
39 *  dsa 2048 bits 0.0049s 0.0061s 204.7 165.0
40 *
41 * 'apps/openssl speed rsa dsa' output with this module:
42 *
43 *          sign    verify    sign/s verify/s
44 *  rsa 512 bits 0.0004s 0.0000s 2767.1 33297.9
45 *  rsa 1024 bits 0.0012s 0.0001s 867.4 14674.7
46 *  rsa 2048 bits 0.0061s 0.0002s 164.0 5270.0
47 *  rsa 4096 bits 0.0384s 0.0006s 26.1 1650.8
48 *          sign    verify    sign/s verify/s
49 *  dsa 512 bits 0.0002s 0.0003s 4442.2 3786.3
50 *  dsa 1024 bits 0.0005s 0.0007s 1835.1 1497.4
51 *  dsa 2048 bits 0.0016s 0.0020s 620.4 504.6
52 *
53 * For the reference. IA-32 assembler implementation performs
54 * very much like 64-bit code compiled with no-asm on the same
55 * machine.

18 /*
19 "BS2000 OSD" is a POSIX subsystem on a main frame.
20 It is made by Siemens AG, Germany, for their BS2000 mainframe machines.
21 Within the POSIX subsystem, the same character set was chosen as in
22 "native BS2000", namely EBCDIC. (EDF04)

24 The name "ASCII" in these routines is misleading: actually, conversion
25 is not between EBCDIC and ASCII, but EBCDIC(EDF04) and ISO-8859.1;
26 that means that (western european) national characters are preserved.

28 This table is identical to the one used by rsh/rcp/ftp and other POSIX tools
