30 #
31 ROOT=          /proto
32 #
33 #
34 # Adjunct root, containing an additional proto area to be used for headers
35 # and libraries.
36 #
37 ADJUNCT_PROTO=
38 #
39 #
40 # Adjunct for building things that run on the build machine.
41 #
42 NATIVE_ADJUNCT= /usr
43 #
44 #
45 # RELEASE_BUILD should be cleared for final release builds.
46 # NOT_RELEASE_BUILD is exactly what the name implies.
47 #
48 # __GNUC toggles the building of ON components using gcc and related tools.
49 # Normally set to '#', set it to '' to do gcc build.
50 #
51 # The declaration POUND_SIGN is always '#'. This is needed to get around the
52 # make feature that '#' is always a comment delimiter, even when escaped or
53 # quoted. We use this macro expansion method to get POUND_SIGN rather than
54 # always breaking out a shell because the general case can cause a noticable
55 # slowdown in build times when so many Makefiles include Makefile.master.
56 #
57 # While the majority of users are expected to override the setting below
58 # with an env file (via nightly or bldenv), if you aren't building that way
59 # (ie, you're using "ws" or some other bootstrapping method) then you need
60 # this definition in order to avoid the subshell invocation mentioned above.
61 #
```

30 #
31 # Note that the commands 'agents', 'lp', 'perl', and 'man' are first in
32 # the list, violating alphabetical order. This is because they are very
33 # long-running and should be given the most wall-clock time for a
34 # parallel build.
35 #
36 # Commands in the FIRST_SUBDIRS list are built before starting the build
37 # of other commands. Currently this includes only 'isaexec' and
38 # 'platexec'. This is necessary because $(ROOT)/usr/lib/isaexec or
39 # $(ROOT)/usr/lib/platexec must exist when some other commands are built
40 # because their 'make install' creates a hard link to one of them.
41 #
42 # Commands are listed one per line so that TeamWare can auto-merge most
43 # changes.
44 #

1 -----  
2 14 January 2014. Summary of changes for version 20140114:  
2 27 May 2011. Summary of changes for version 20110527:

4 1) ACPICA kernel-resident subsystem:  
4 This release is available at [www.acpica.org/downloads](http://www.acpica.org/downloads)

6 Updated all ACPICA copyrights and signons to 2014. Added the 2014  
7 copyright to all module headers and signons, including the standard Linux  
8 header. This affects virtually every file in the ACPICA core subsystem,  
9 iASL compiler, all ACPICA utilities, and the test suites.

11 Improved parameter validation for AcpiInstallGpeBlock. Added the  
12 following checks:  
13 1) The incoming device handle refers to type ACPI\_TYPE\_DEVICE.  
14 2) There is not already a GPE block attached to the device.  
15 Likewise, with AcpiRemoveGpeBlock, ensure that the incoming object is a  
16 device.

18 Correctly support "references" in the ACPI\_OBJECT. This change fixes the  
19 support to allow references (namespace nodes) to be passed as arguments  
20 to control methods via the evaluate object interface. This is probably  
21 most useful for testing purposes, however.

23 Improved support for 32/64 bit physical addresses in printf()-like  
24 output. This change improves the support for physical addresses in printf  
25 debug statements and other output on both 32-bit and 64-bit hosts. It  
26 consistently outputs the appropriate number of bytes for each host. The  
27 %p specifier is unsatisfactory since it does not emit uniform output on  
28 all hosts/clib implementations (on some, leading zeros are not supported,  
29 leading to difficult-to-read output).

31 Example Code and Data Size: These are the sizes for the OS-independent  
32 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
33 debug version of the code includes the debug output trace mechanism and  
34 has a much larger code and data size.

36 Current Release:  
37 Non-Debug Version: 96.2K Code, 27.0K Data, 123.2K Total  
38 Debug Version: 187.5K Code, 78.3K Data, 265.8K Total  
39 Previous Release:  
40 Non-Debug Version: 96.1K Code, 27.0K Data, 123.1K Total  
41 Debug Version: 185.6K Code, 77.3K Data, 262.9K Total

44 2) iASL Compiler/Disassembler and Tools:

46 iASL: Fix a possible fault when using the Connection() operator. Fixes a  
47 problem if the parent Field definition for the Connection operator refers  
48 to an operation region that does not exist. ACPICA BZ 1064.

50 AcpiExec: Load of local test tables is now optional. The utility has the  
51 capability to load some various tables to test features of ACPICA.  
52 However, there are enough of them that the output of the utility became  
53 confusing. With this change, only the required local tables are displayed  
54 (RSDP, XSDT, etc.) along with the actual tables loaded via the command

new/usr/src/common/acpica/changes.txt

2

55 line specification. This makes the default output simpler and easier to  
56 understand. The -el command line option restores the original behavior  
57 for testing purposes.

59 AcpiExec: Added support for overlapping operation regions. This change  
60 expands the simulation of operation regions by supporting regions that  
61 overlap within the given address space. Supports SystemMemory and  
62 SystemIO. ASLTS test suite updated also. David Box. ACPICA BZ 1031.

64 AcpiExec: Added region handler support for PCI\_Config and EC spaces. This  
65 allows AcpiExec to simulate these address spaces, similar to the current  
66 support for SystemMemory and SystemIO.

68 Debugger: Added new command to read/write/compare all namespace objects.  
69 The command "test objects" will exercise the entire namespace by writing  
70 new values to each data object, and ensuring that the write was  
71 successful. The original value is then restored and verified.

73 Debugger: Added the "test predefined" command. This change makes this  
74 test public and puts it under the new "test" command. The test executes  
75 each and every predefined name within the current namespace.

77 -----  
78 18 December 2013. Summary of changes for version 20131218:

80 Global note: The ACPI 5.0A specification was released this month. There  
81 are no changes needed for ACPICA since this release of ACPI is an  
82 errata/clarification release. The specification is available at  
83 [acpi.info](http://acpi.info).

86 1) ACPICA kernel-resident subsystem:

88 Added validation of the XSDT root table if it is present. Some older  
89 platforms contain an XSDT that is ill-formed or otherwise invalid (such  
90 as containing some or all entries that are NULL pointers). This change  
91 adds a new function to validate the XSDT before actually using it. If the  
92 XSDT is found to be invalid, ACPICA will now automatically fall back to  
93 using the RSDT instead. Original implementation by Zhao Yakui. Ported to  
94 ACPICA and enhanced by Lv Zheng and Bob Moore.

96 Added a runtime option to ignore the XSDT and force the use of the RSDT.  
97 This change adds a runtime option that will force ACPICA to use the RSDT  
98 instead of the XSDT (AcpiGbl\_DoNotUseXsdt). Although the ACPI spec  
99 requires that an XSDT be used instead of the RSDT, the XSDT has been  
100 found to be corrupt or ill-formed on some machines. Lv Zheng.

102 Added a runtime option to favor 32-bit FADT register addresses over the  
103 64-bit addresses. This change adds an option to favor 32-bit FADT  
104 addresses when there is a conflict between the 32-bit and 64-bit versions  
105 of the same register. The default behavior is to use the 64-bit version  
106 in accordance with the ACPI specification. This can now be overridden via  
107 the AcpiGbl\_Use32BitFadtAddresses flag. ACPICA BZ 885. Lv Zheng.

109 During the change above, the internal "Convert FADT" and "Verify FADT"  
110 functions have been merged to simplify the code, making it easier to  
111 understand and maintain. ACPICA BZ 933.

113 Improve exception reporting and handling for GPE block installation.  
114 Return an actual status from AcpiEvGetGpeXruptBlock and don't clobber the  
115 status when exiting AcpiEvInstallGpeBlock. ACPICA BZ 1019.

117 Added helper macros to extract bus/segment numbers from the HEST table.  
118 This change adds two macros to extract the encoded bus and segment  
119 numbers from the HEST Bus field - ACPI\_HEST\_BUS and ACPI\_HEST\_SEGMENT.  
120 Betty Dall <[betty.dall@hp.com](mailto:betty.dall@hp.com)>

122 Removed the unused ACPI\_FREE\_BUFFER macro. This macro is no longer used  
 123 by ACPICA. It is not a public macro, so it should have no effect on  
 124 existing OSV code. Lv Zheng.

126 Example Code and Data Size: These are the sizes for the OS-independent  
 127 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 128 debug version of the code includes the debug output trace mechanism and  
 129 has a much larger code and data size.

131 Current Release:  
 132 Non-Debug Version: 96.1K Code, 27.0K Data, 123.1K Total  
 133 Debug Version: 185.6K Code, 77.3K Data, 262.9K Total  
 134 Previous Release:  
 135 Non-Debug Version: 95.9K Code, 27.0K Data, 122.9K Total  
 136 Debug Version: 185.1K Code, 77.2K Data, 262.3K Total

## 139 2) iASL Compiler/Disassembler and Tools:

141 Disassembler: Improved pathname support for emitted External()  
 142 statements. This change adds full pathname support for external names  
 143 that have been resolved internally by the inclusion of additional ACPI  
 144 tables (via the iASL -e option). Without this change, the disassembler  
 145 can emit multiple externals for the same object, or it become confused  
 146 when the Scope() operator is used on an external object. Overall, greatly  
 147 improves the ability to actually recompile the emitted ASL code when  
 148 objects a referenced across multiple ACPI tables. Reported by Michael  
 149 Tsirkin (mst@redhat.com).

151 Tests/ASLTS: Updated functional control suite to execute with no errors.  
 152 David Box. Fixed several errors related to the testing of the interpreter  
 153 slack mode. Lv Zheng.

155 iASL: Added support to detect names that are declared within a control  
 156 method, but are unused (these are temporary names that are only valid  
 157 during the time the method is executing). A remark is issued for these  
 158 cases. ACPICA BZ 1022.

160 iASL: Added full support for the DBG2 table. Adds full disassembler,  
 161 table compiler, and template generator support for the DBG2 table (Debug  
 162 Port 2 table).

164 iASL: Added full support for the PCCT table, update the table definition.  
 165 Updates the PCCT table definition in the actbl3.h header and adds table  
 166 compiler and template generator support.

168 iASL: Added an option to emit only error messages (no warnings/remarks).  
 169 The -ve option will enable only error messages, warnings and remarks are  
 170 suppressed. This can simplify debugging when only the errors are  
 171 important, such as when an ACPI table is disassembled and there are many  
 172 warnings and remarks -- but only the actual errors are of real interest.

174 Example ACPICA code (source/tools/examples): Updated the example code so  
 175 that it builds to an actual working program, not just example code. Added  
 176 ACPI tables and execution of an example control method in the DSDT. Added  
 177 makefile support for Unix generation.

179 -----  
 180 15 November 2013. Summary of changes for version 20131115:

182 This release is available at <https://acpica.org/downloads>

## 185 1) ACPICA kernel-resident subsystem:

187 Resource Manager: Fixed loop termination for the "get AML length"  
 188 function. The loop previously had an error termination on a NULL resource  
 189 pointer, which can never happen since the loop simply increments a valid  
 190 resource pointer. This fix changes the loop to terminate with an error on  
 191 an invalid end-of-buffer condition. The problem can be seen as an  
 192 infinite loop by callers to AcpiSetCurrentResources with an invalid or  
 193 corrupted resource descriptor, or a resource descriptor that is missing  
 194 an END\_TAG descriptor. Reported by Dan Carpenter  
 195 <dan.carpenter@oracle.com>. Lv Zheng, Bob Moore.

197 Table unload and ACPICA termination: Delete all attached data objects  
 198 during namespace node deletion. This fix updates namespace node deletion  
 199 to delete the entire list of attached objects (attached via  
 200 AcpiAttachObject) instead of just one of the attached items. ACPICA BZ  
 201 1024. Tomasz Nowicki (tomasz.nowicki@linaro.org).

203 ACPICA termination: Added support to delete all objects attached to the  
 204 root namespace node. This fix deletes any and all objects that have been  
 205 attached to the root node via AcpiAttachData. Previously, none of these  
 206 objects were deleted. Reported by Tomasz Nowicki. ACPICA BZ 1026.

208 Debug output: Do not emit the function nesting level for the in-kernel  
 209 build. The nesting level is really only useful during a single-thread  
 210 execution. Therefore, only enable this output for the AcpiExec utility.  
 211 Also, only emit the thread ID when executing under AcpiExec (Context  
 212 switches are still always detected and a message is emitted). ACPICA BZ  
 213 972.

215 Example Code and Data Size: These are the sizes for the OS-independent  
 216 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 217 debug version of the code includes the debug output trace mechanism and  
 218 has a much larger code and data size.

220 Current Release:  
 221 Non-Debug Version: 95.9K Code, 27.0K Data, 122.9K Total  
 222 Debug Version: 185.1K Code, 77.2K Data, 262.3K Total  
 223 Previous Release:  
 224 Non-Debug Version: 95.8K Code, 27.0K Data, 122.8K Total  
 225 Debug Version: 185.2K Code, 77.2K Data, 262.4K Total

## 228 2) iASL Compiler/Disassembler and Tools:

230 AcpiExec/Unix-OSL: Use <termios.h> instead of <termio.h>. This is the  
 231 correct portable POSIX header for terminal control functions.

233 Disassembler: Fixed control method invocation issues related to the use  
 234 of the CondRefOf() operator. The problem is seen in the disassembly where  
 235 control method invocations may not be disassembled properly if the  
 236 control method name has been used previously as an argument to CondRefOf.  
 237 The solution is to not attempt to emit an external declaration for the  
 238 CondRefOf target (it is not necessary in the first place). This prevents  
 239 disassembler object type confusion. ACPICA BZ 988.

241 Unix Makefiles: Added an option to disable compiler optimizations and the  
 242 \_FORTIFY\_SOURCE flag. Some older compilers have problems compiling ACPICA  
 243 with optimizations (reportedly, gcc 4.4 for example). This change adds a  
 244 command line option for make (NOOPT) that disables all compiler  
 245 optimizations and the \_FORTIFY\_SOURCE compiler flag. The default  
 246 optimization is -O2 with the \_FORTIFY\_SOURCE flag specified. ACPICA BZ  
 247 1034. Lv Zheng, Bob Moore.

249 Tests/ASLTS: Added options to specify individual test cases and modes.  
 250 This allows testers running aslts.sh to optionally specify individual  
 251 test modes and test cases. Also added an option to disable the forced  
 252 generation of the ACPICA tools from source if desired. Lv Zheng.

```

254 -----
255 27 September 2013. Summary of changes for version 20130927:

257 This release is available at https://acpica.org/downloads

260 1) ACPICA kernel-resident subsystem:

262 Fixed a problem with store operations to reference objects. This change
263 fixes a problem where a Store operation to an ArgX object that contained
264 a
265 reference to a field object did not complete the automatic dereference
266 and
267 then write to the actual field object. Instead, the object type of the
268 field object was inadvertently changed to match the type of the source
269 operand. The new behavior will actually write to the field object (buffer
270 field or field unit), thus matching the correct ACPI-defined behavior.

272 Implemented support to allow the host to redefine individual OSL
273 prototypes. This change enables the host to redefine OSL prototypes found
274 in the acpiosxf.h file. This allows the host to implement OSL interfaces
275 with a macro or inlined function. Further, it allows the host to add any
276 additional required modifiers such as __iomem, __init, __exit, etc., as
277 necessary on a per-interface basis. Enables maximum flexibility for the
278 OSL interfaces. Lv Zheng.

280 Hardcoded the access width for the FADT-defined reset register. The ACPI
281 specification requires the reset register width to be 8 bits. ACPICA now
282 hardcodes the width to 8 and ignores the FADT width value. This provides
283 compatibility with other ACPI implementations that have allowed BIOS code
284 with bad register width values to go unnoticed. Matthew Garrett, Bob
285 Moore,
286 Lv Zheng.

288 Changed the position/use of the ACPI_PRINTF_LIKE macro. This macro is
289 used
290 in the OSL header (acpiosxf). The change modifies the position of this
291 macro in each instance where it is used (AcpiDebugPrint, etc.) to avoid
292 build issues if the OSL defines the implementation of the interface to be
293 an inline stub function. Lv Zheng.

295 Deployed a new macro ACPI_EXPORT_SYMBOL_INIT for the main ACPICA
296 initialization interfaces. This change adds a new macro for the main init
297 and terminate external interfaces in order to support hosts that require
298 additional or different processing for these functions. Changed from
299 ACPI_EXPORT_SYMBOL to ACPI_EXPORT_SYMBOL_INIT for these functions. Lv
300 Zheng, Bob Moore.

302 Cleaned up the memory allocation macros for configurability. In the
303 common
304 case, the ACPI_ALLOCATE and related macros now resolve directly to their
305 respective AcpiOs* OSL interfaces. Two options:
306 1) The ACPI_ALLOCATE_ZEROED macro uses a simple local implementation by
307 default, unless overridden by the USE_NATIVE_ALLOCATE_ZEROED define.
308 2) For AcpiExec (and for debugging), the macros can optionally be
309 resolved
310 to the local ACPICA interfaces that track each allocation (local tracking
311 is used to immediately detect memory leaks).
312 Lv Zheng.

314 Simplified the configuration for ACPI_REduced_HARDWARE. Allows the kernel
315 to predefine this macro to either TRUE or FALSE during the system build.

317 Replaced __FUNCTION__ with __func__ in the gcc-specific header.

```

```

319 Example Code and Data Size: These are the sizes for the OS-independent
320 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
321 debug version of the code includes the debug output trace mechanism and
322 has a much larger code and data size.

324 Current Release:
325 Non-Debug Version: 95.8K Code, 27.0K Data, 122.8K Total
326 Debug Version: 185.2K Code, 77.2K Data, 262.4K Total
327 Previous Release:
328 Non-Debug Version: 96.7K Code, 27.1K Data, 123.9K Total
329 Debug Version: 184.4K Code, 76.8K Data, 261.2K Total

332 2) iASL Compiler/Disassembler and Tools:

334 iASL: Implemented wildcard support for the -e option. This simplifies use
335 when there are many SSDTs that must be included to resolve external
336 method
337 declarations. ACPICA BZ 1041. Example:
338 iasl -e ssdt*.dat -d dsdt.dat

340 AcpiExec: Add history/line-editing for Unix/Linux systems. This change
341 adds a portable module that implements full history and limited line
342 editing for Unix and Linux systems. It does not use readline() due to
343 portability issues. Instead it uses the POSIX termio interface to put the
344 terminal in raw input mode so that the various special keys can be
345 trapped
346 (such as up/down-arrow for history support and left/right-arrow for line
347 editing). Uses the existing debugger history mechanism. ACPICA BZ 1036.

349 AcpiXtract: Add support to handle (ignore) "empty" lines containing only
350 one or more spaces. This provides compatible with early or different
351 versions of the AcpiDump utility. ACPICA BZ 1044.

353 AcpiDump: Do not ignore tables that contain only an ACPI table header.
354 Apparently, some BIOSs create SSDTs that contain an ACPI table header but
355 no other data. This change adds support to dump these tables. Any tables
356 shorter than the length of an ACPI table header remain in error (an error
357 message is emitted). Reported by Yi Li.

359 Debugger: Echo actual command along with the "unknown command" message.

361 -----
362 23 August 2013. Summary of changes for version 20130823:

364 1) ACPICA kernel-resident subsystem:

366 Implemented support for host-installed System Control Interrupt (SCI)
367 handlers. Certain ACPI functionality requires the host to handle raw
368 SCIs. For example, the "SCI Doorbell" that is defined for memory power
369 state support requires the host device driver to handle SCIs to examine
370 if the doorbell has been activated. Multiple SCI handlers can be
371 installed to allow for future expansion. New external interfaces are
372 AcpiInstallSciHandler, AcpiRemoveSciHandler; see the ACPICA reference for
373 details. Lv Zheng, Bob Moore. ACPICA BZ 1032.

375 Operation region support: Never locally free the handler "context"
376 pointer. This change removes some dangerous code that attempts to free
377 the handler context pointer in some (rare) circumstances. The owner of
378 the handler owns this pointer and the ACPICA code should never touch it.
379 Although not seen to be an issue in any kernel, it did show up as a
380 problem (fault) under AcpiExec. Also, set the internal storage field for
381 the context pointer to zero when the region is deactivated, simply for
382 sanity. David Box. ACPICA BZ 1039.

384 AcpiRead: On error, do not modify the return value target location. If an

```

385 error happens in the middle of a split 32/32 64-bit I/O operation, do not  
 386 modify the target of the return value pointer. Makes the code consistent  
 387 with the rest of ACPICA. Bjorn Helgaas.

389 Example Code and Data Size: These are the sizes for the OS-independent  
 390 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 391 debug version of the code includes the debug output trace mechanism and  
 392 has a much larger code and data size.

394 Current Release:  
 395 Non-Debug Version: 96.7K Code, 27.1K Data, 123.9K Total  
 396 Debug Version: 184.4K Code, 76.8K Data, 261.2K Total  
 397 Previous Release:  
 398 Non-Debug Version: 96.2K Code, 27.1K Data, 123.3K Total  
 399 Debug Version: 185.4K Code, 77.1K Data, 262.5K Total

#### 402 2) iASL Compiler/Disassembler and Tools:

404 AcpiDump: Implemented several new features and fixed some problems:

- 405 1) Added support to dump the RSDP, RSDT, and XSDT tables.
- 406 2) Added support for multiple table instances (SSDT, UEFI).
- 407 3) Added option to dump "customized" (overridden) tables (-c).
- 408 4) Fixed a problem where some table filenames were improperly  
 409 constructed.
- 410 5) Improved some error messages, removed some unnecessary messages.

412 iASL: Implemented additional support for disassembly of ACPI tables that  
 413 contain invocations of external control methods. The -fe<file> option  
 414 allows the import of a file that specifies the external methods along  
 415 with the required number of arguments for each -- allowing for the  
 416 correct disassembly of the table. This is a workaround for a limitation  
 417 of AML code where the disassembler often cannot determine the number of  
 418 arguments required for an external control method and generates incorrect  
 419 ASL code. See the iASL reference for details. ACPICA BZ 1030.

421 Debugger: Implemented a new command (paths) that displays the full  
 422 pathnames (namepaths) and object types of all objects in the namespace.  
 423 This is an alternative to the namespace command.

425 Debugger: Implemented a new command (sci) that invokes the SCI dispatch  
 426 mechanism and any installed handlers.

428 iASL: Fixed a possible segfault for "too many parent prefixes" condition.  
 429 This can occur if there are too many parent prefixes in a namepath (for  
 430 example, ^^^^^^PCIO.ECRD). ACPICA BZ 1035.

432 Application OSLs: Set the return value for the PCI read functions. These  
 433 functions simply return AE\_OK, but should set the return value to zero  
 434 also. This change implements this. ACPICA BZ 1038.

436 Debugger: Prevent possible command line buffer overflow. Increase the  
 437 size of a couple of the debugger line buffers, and ensure that overflow  
 438 cannot happen. ACPICA BZ 1037.

440 iASL: Changed to abort immediately on serious errors during the parsing  
 441 phase. Due to the nature of ASL, there is no point in attempting to  
 442 compile these types of errors, and they typically end up causing a  
 443 cascade of hundreds of errors which obscure the original problem.

445 -----

446 25 December 2013. Summary of changes for version 20130725:

#### 448 1) ACPICA kernel-resident subsystem:

450 Fixed a problem with the DerefOf operator where references to FieldUnits

451 and BufferFields incorrectly returned the parent object, not the actual  
 452 value of the object. After this change, a dereference of a FieldUnit  
 453 reference results in a read operation on the field to get the value, and  
 454 likewise, the appropriate BufferField value is extracted from the target  
 455 buffer.

457 Fixed a problem where the \_WAK method could cause a fault under these  
 458 circumstances: 1) Interpreter slack mode was not enabled, and 2) the \_WAK  
 459 method returned no value. The problem is rarely seen because most kernels  
 460 run ACPICA in slack mode.

462 For the DerefOf operator, a fatal error now results if an attempt is made  
 463 to dereference a reference (created by the Index operator) to a NULL  
 464 package element. Provides compatibility with other ACPI implementations,  
 465 and this behavior will be added to a future version of the ACPI  
 466 specification.

468 The ACPI Power Management Timer (defined in the FADT) is now optional.  
 469 This provides compatibility with other ACPI implementations and will  
 470 appear in the next version of the ACPI specification. If there is no PM  
 471 timer on the platform, AcpiGetTimer returns AE\_SUPPORT. An address of  
 472 zero in the FADT indicates no PM timer.

474 Implemented a new interface for \_OSI support, AcpiUpdateInterfaces. This  
 475 allows the host to globally enable/disable all vendor strings, all  
 476 feature strings, or both. Intended to be primarily used for debugging  
 477 purposes only. Lv Zheng.

479 Expose the collected \_OSI data to the host via a global variable. This  
 480 data tracks the highest level vendor ID that has been invoked by the BIOS  
 481 so that the host (and potentially ACPICA itself) can change behaviors  
 482 based upon the age of the BIOS.

484 Example Code and Data Size: These are the sizes for the OS-independent  
 485 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 486 debug version of the code includes the debug output trace mechanism and  
 487 has a much larger code and data size.

489 Current Release:  
 490 Non-Debug Version: 96.2K Code, 27.1K Data, 123.3K Total  
 491 Debug Version: 184.4K Code, 76.8K Data, 261.2K Total  
 492 Previous Release:  
 493 Non-Debug Version: 95.9K Code, 26.9K Data, 122.8K Total  
 494 Debug Version: 184.1K Code, 76.7K Data, 260.8K Total

#### 497 2) iASL Compiler/Disassembler and Tools:

499 iASL: Created the following enhancements for the -so option (create  
 500 offset table):  
 501 1) Add offsets for the last nameseg in each namepath for every supported  
 502 object type  
 503 2) Add support for Processor, Device, Thermal Zone, and Scope objects  
 504 3) Add the actual AML opcode for the parent object of every supported  
 505 object type  
 506 4) Add support for the ZERO/ONE/ONES AML opcodes for integer objects

508 Disassembler: Emit all unresolved external symbols in a single block.  
 509 These are external references to control methods that could not be  
 510 resolved, and thus, the disassembler had to make a guess at the number of  
 511 arguments to parse.

513 iASL: The argument to the -T option (create table template) is now  
 514 optional. If not specified, the default table is a DSDT, typically the  
 515 most common case.

```

517 -----
518 26 June 2013. Summary of changes for version 20130626:

520 1) ACPICA kernel-resident subsystem:

522 Fixed an issue with runtime repair of the _CST object. Null or invalid
523 elements were not always removed properly. Lv Zheng.

525 Removed an arbitrary restriction of 256 GPEs per GPE block (such as the
526 FADT-defined GPE0 and GPE1). For GPE0, GPE1, and each GPE Block Device,
527 the maximum number of GPEs is 1016. Use of multiple GPE block devices
528 makes the system-wide number of GPEs essentially unlimited.

530 Example Code and Data Size: These are the sizes for the OS-independent
531 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
532 debug version of the code includes the debug output trace mechanism and
533 has a much larger code and data size.

535 Current Release:
536 Non-Debug Version: 95.9K Code, 26.9K Data, 122.8K Total
537 Debug Version: 184.1K Code, 76.7K Data, 260.8K Total
538 Previous Release:
539 Non-Debug Version: 96.0K Code, 27.0K Data, 123.0K Total
540 Debug Version: 184.1K Code, 76.8K Data, 260.9K Total

543 2) iASL Compiler/Disassembler and Tools:

545 Portable AcpiDump: Implemented full support for the Linux and FreeBSD
546 hosts. Now supports Linux, FreeBSD, and Windows.

548 Disassembler: Added some missing types for the HEST and EINJ tables: "Set
549 Error Type With Address", "CMCI", "MCE", and "Flush Cacheline".

551 iASL/Preprocessor: Implemented full support for nested
552 #if/#else/#elif/#endif blocks. Allows arbitrary depth of nested blocks.

554 Disassembler: Expanded maximum output string length to 64K. Was 256 bytes
555 max. The original purpose of this constraint was to limit the amount of
556 debug output. However, the string function in question (UtPrintString) is
557 now used for the disassembler also, where 256 bytes is insufficient.
558 Reported by RehabMan@GitHub.

560 iASL/DataTables: Fixed some problems and issues with compilation of DMAR
561 tables. ACPICA BZ 999. Lv Zheng.

563 iASL: Fixed a couple of error exit issues that could result in a "Could
564 not delete <file>" message during ASL compilation.

566 AcpiDump: Allow "FADT" and "MADT" as valid table signatures, even though
567 the actual signatures for these tables are "FACP" and "APIC",
568 respectively.

570 AcpiDump: Added support for multiple UEFI tables. Only SSDT and UEFI
571 tables are allowed to have multiple instances.

573 -----
574 17 May 2013. Summary of changes for version 20130517:

576 1) ACPICA kernel-resident subsystem:

578 Fixed a regression introduced in version 20130328 for _INI methods. This
579 change fixes a problem introduced in 20130328 where _INI methods are no
580 longer executed properly because of a memory block that was not
581 initialized correctly. ACPICA BZ 1016. Tomasz Nowicki
582 <tomasz.nowicki@linaro.org>.

```

```

584 Fixed a possible problem with the new extended sleep registers in the
585 ACPI
586 5.0 FADT. Do not use these registers (even if populated) unless the HW-
587 reduced bit is set in the FADT (as per the ACPI specification). ACPICA BZ
588 1020. Lv Zheng.

590 Implemented return value repair code for _CST predefined objects: Sort
591 the
592 list and detect/remove invalid entries. ACPICA BZ 890. Lv Zheng.

594 Implemented a debug-only option to disable loading of SSDTs from the
595 RSDT/XSDT during ACPICA initialization. This can be useful for debugging
596 ACPI problems on some machines. Set AcpiGbl_DisableSsdtTableLoad in
597 acglobal.h - ACPICA BZ 1005. Lv Zheng.

599 Fixed some issues in the ACPICA initialization and termination code:
600 Tomasz Nowicki <tomasz.nowicki@linaro.org>
601 1) Clear events initialized flag upon event component termination. ACPICA
602 BZ 1013.
603 2) Fixed a possible memory leak in GPE init error path. ACPICA BZ 1018.
604 3) Delete global lock pending lock during termination. ACPICA BZ 1012.
605 4) Clear debug buffer global on termination to prevent possible multiple
606 delete. ACPICA BZ 1010.

608 Standardized all switch() blocks across the entire source base. After
609 many
610 years, different formatting for switch() had crept in. This change makes
611 the formatting of every switch block identical. ACPICA BZ 997. Chao Guan.

613 Split some files to enhance ACPICA modularity and configurability:
614 1) Split buffer dump routines into utilities/utbuffer.c
615 2) Split internal error message routines into utilities/uterror.c
616 3) Split table print utilities into tables/tbprint.c
617 4) Split iASL command-line option processing into asloptions.c

619 Makefile enhancements:
620 1) Support for all new files above.
621 2) Abort make on errors from any subcomponent. Chao Guan.
622 3) Add build support for Apple Mac OS X. Liang Qi.

624 Example Code and Data Size: These are the sizes for the OS-independent
625 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
626 debug version of the code includes the debug output trace mechanism and
627 has a much larger code and data size.

629 Current Release:
630 Non-Debug Version: 96.0K Code, 27.0K Data, 123.0K Total
631 Debug Version: 184.1K Code, 76.8K Data, 260.9K Total
632 Previous Release:
633 Non-Debug Version: 95.6K Code, 26.8K Data, 122.4K Total
634 Debug Version: 183.5K Code, 76.6K Data, 260.1K Total

637 2) iASL Compiler/Disassembler and Tools:

639 New utility: Implemented an easily portable version of the acpidump
640 utility to extract ACPI tables from the system (or a file) in an ASCII
641 hex
642 dump format. The top-level code implements the various command line
643 options, file I/O, and table dump routines. To port to a new host, only
644 three functions need to be implemented to get tables -- since this
645 functionality is OS-dependent. See the tools/acpidump/apmain.c module and
646 the ACPICA reference for porting instructions. ACPICA BZ 859. Notes:
647 1) The Windows version obtains the ACPI tables from the Registry.
648 2) The Linux version is under development.

```

```

649 3) Other hosts - If an OS-dependent module is submitted, it will be
650 distributed with ACPICA.

652 iASL: Fixed a regression for -D preprocessor option (define symbol). A
653 restructuring/change to the initialization sequence caused this option to
654 no longer work properly.

656 iASL: Implemented a mechanism to disable specific warnings and remarks.
657 Adds a new command line option, "-vw <messageid> as well as "#pragma
658 disable <messageid>". ACPICA BZ 989. Chao Guan, Bob Moore.

660 iASL: Fix for too-strict package object validation. The package object
661 validation for return values from the predefined names is a bit too
662 strict, it does not allow names references within the package (which will
663 be resolved at runtime.) These types of references cannot be validated at
664 compile time. This change ignores named references within package objects
665 for names that return or define static packages.

667 Debugger: Fixed the 80-character command line limitation for the History
668 command. Now allows lines of arbitrary length. ACPICA BZ 1000. Chao Guan.

670 iASL: Added control method and package support for the -so option
671 (generates AML offset table for BIOS support.)

673 iASL: issue a remark if a non-serialized method creates named objects. If
674 a thread blocks within the method for any reason, and another thread
675 enters the method, the method will fail because an attempt will be made
676 to
677 create the same (named) object twice. In this case, issue a remark that
678 the method should be marked serialized. NOTE: may become a warning later.
679 ACPICA BZ 909.

681 -----
682 18 April 2013. Summary of changes for version 20130418:

684 1) ACPICA kernel-resident subsystem:

686 Fixed a possible buffer overrun during some rare but specific field unit
687 read operations. This overrun can only happen if the DSDT version is 1 --
688 meaning that all AML integers are 32 bits -- and the field length is
689 between 33 and 55 bits long. During the read, an internal buffer object
690 is
691 created for the field unit because the field is larger than an integer
692 (32
693 bits). However, in this case, the buffer will be incorrectly written
694 beyond the end because the buffer length is less than the internal
695 minimum
696 of 64 bits (8 bytes) long. The buffer will be either 5, 6, or 7 bytes
697 long, but a full 8 bytes will be written.

699 Updated the Embedded Controller "orphan" _REG method support. This refers
700 to _REG methods under the EC device that have no corresponding operation
701 region. This is allowed by the ACPI specification. This update removes a
702 dependency on the existence an ECDT table. It will execute an orphan _REG
703 method as long as the operation region handler for the EC is installed at
704 the EC device node and not the namespace root. Rui Zhang (original
705 update), Bob Moore (update/integrate).

707 Implemented run-time argument typechecking for all predefined ACPI names
708 (_STA, _BIF, etc.) This change performs object typechecking on all
709 incoming arguments for all predefined names executed via
710 AcpiEvaluateObject. This ensures that ACPI-related device drivers are
711 passing correct object types as well as the correct number of arguments
712 (therefore identifying any issues immediately). Also, the ASL/namespace
713 definition of the predefined name is checked against the ACPI
714 specification for the proper argument count. Adds one new file,

```

```

715 nsarguments.c

717 Changed an exception code for the ASL UnLoad() operator. Changed the
718 exception code for the case where the input DdbHandle is invalid, from
719 AE_BAD_PARAMETER to the more appropriate AE_AML_OPERAND_TYPE.

721 Unix/Linux makefiles: Removed the use of the -O2 optimization flag in the
722 global makefile. The use of this flag causes compiler errors on earlier
723 versions of GCC, so it has been removed for compatibility.

725 Miscellaneous cleanup:
726 1) Removed some unused/obsolete macros
727 2) Fixed a possible memory leak in the _OSI support
728 3) Removed an unused variable in the predefined name support
729 4) Windows OSL: remove obsolete reference to a memory list field

731 Example Code and Data Size: These are the sizes for the OS-independent
732 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
733 debug version of the code includes the debug output trace mechanism and
734 has a much larger code and data size.

736 Current Release:
737 Non-Debug Version: 95.2K Code, 26.4K Data, 121.6K Total
738 Debug Version: 183.0K Code, 76.0K Data, 259.0K Total
739 Previous Release:
740 Non-Debug Version: 95.6K Code, 26.8K Data, 122.4K Total
741 Debug Version: 183.5K Code, 76.6K Data, 260.1K Total

744 2) iASL Compiler/Disassembler and Tools:

746 AcpiExec: Added installation of a handler for the SystemCMOS address
747 space. This prevents control method abort if a method accesses this
748 space.

750 AcpiExec: Added support for multiple EC devices, and now install EC
751 operation region handler(s) at the actual EC device instead of the
752 namespace root. This reflects the typical behavior of host operating
753 systems.

755 AcpiExec: Updated to ensure that all operation region handlers are
756 installed before the _REG methods are executed. This prevents a _REG
757 method from aborting if it accesses an address space has no handler.
758 AcpiExec installs a handler for every possible address space.

760 Debugger: Enhanced the "handlers" command to display non-root handlers.
761 This change enhances the handlers command to display handlers associated
762 with individual devices throughout the namespace, in addition to the
763 currently supported display of handlers associated with the root
764 namespace
765 node.

767 ASL Test Suite: Several test suite errors have been identified and
768 resolved, reducing the total error count during execution. Chao Guan.

770 -----
771 28 March 2013. Summary of changes for version 20130328:

773 1) ACPICA kernel-resident subsystem:

775 Fixed several possible race conditions with the internal object reference
776 counting mechanism. Some of the external ACPICA interfaces update object
777 reference counts without holding the interpreter or namespace lock. This
778 change adds a spinlock to protect reference count updates on the internal
779 ACPICA objects. Reported by and with assistance from Andriy Gapon
780 (avg@FreeBSD.org).

```

782 FADT support: Removed an extraneous warning for very large GPE register  
 783 sets. This change removes a size mismatch warning if the legacy length  
 784 field for a GPE register set is larger than the 64-bit GAS structure can  
 785 accommodate. GPE register sets can be larger than the 255-bit width  
 786 limitation of the GAS structure. Linn Crosetto (linn@hp.com).

788 \_OSI Support: handle any errors from AcpiOsAcquireMutex. Check for error  
 789 return from this interface. Handles a possible timeout case if  
 790 ACPI\_WAIT\_FOREVER is modified by the host to be a value less than  
 791 "forever". Jung-uk Kim.

793 Predefined name support: Add allowed/required argument type information  
 794 to  
 795 the master predefined info table. This change adds the infrastructure to  
 796 enable typechecking on incoming arguments for all predefined  
 797 methods/objects. It does not actually contain the code that will fully  
 798 utilize this information, this is still under development. Also condenses  
 799 some duplicate code for the predefined names into a new module,  
 800 utilities/utpredef.c

802 Example Code and Data Size: These are the sizes for the OS-independent  
 803 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 804 debug version of the code includes the debug output trace mechanism and  
 805 has a much larger code and data size.

807 Previous Release:  
 808 Non-Debug Version: 95.0K Code, 25.9K Data, 120.9K Total  
 809 Debug Version: 182.9K Code, 75.6K Data, 258.5K Total  
 810 Current Release:  
 811 Non-Debug Version: 95.2K Code, 26.4K Data, 121.6K Total  
 812 Debug Version: 183.0K Code, 76.0K Data, 259.0K Total

#### 815 2) iASL Compiler/Disassembler and Tools:

817 iASL: Implemented a new option to simplify the development of ACPI-  
 818 related  
 819 BIOS code. Adds support for a new "offset table" output file. The -so  
 820 option will create a C table containing the AML table offsets of various  
 821 named objects in the namespace so that BIOS code can modify them easily  
 822 at  
 823 boot time. This can simplify BIOS runtime code by eliminating expensive  
 824 searches for "magic values", enhancing boot times and adding greater  
 825 reliability. With assistance from Lee Hamel.

827 iASL: Allow additional predefined names to return zero-length packages.  
 828 Now, all predefined names that are defined by the ACPI specification to  
 829 return a "variable-length package of packages" are allowed to return a  
 830 zero length top-level package. This allows the BIOS to tell the host that  
 831 the requested feature is not supported, and supports existing BIOS/ASL  
 832 code and practices.

834 iASL: Changed the "result not used" warning to an error. This is the case  
 835 where an ASL operator is effectively a NOOP because the result of the  
 836 operation is not stored anywhere. For example:  
 837 Add (4, Local0)  
 838 There is no target (missing 3rd argument), nor is the function return  
 839 value used. This is potentially a very serious problem -- since the code  
 840 was probably intended to do something, but for whatever reason, the value  
 841 was not stored. Therefore, this issue has been upgraded from a warning to  
 842 an error.

844 AcpiHelp: Added allowable/required argument types to the predefined names  
 845 info display. This feature utilizes the recent update to the predefined  
 846 names table (above).

848 -----  
 849 14 February 2013. Summary of changes for version 20130214:

#### 851 1) ACPICA Kernel-resident Subsystem:

853 Fixed a possible regression on some hosts: Reinstated the safe return  
 854 macros (return ACPI\_STATUS, etc.) that ensure that the argument is  
 855 evaluated only once. Although these macros are not needed for the ACPICA  
 856 code itself, they are often used by ACPI-related host device drivers  
 857 where  
 858 the safe feature may be necessary.

860 Fixed several issues related to the ACPI 5.0 reduced hardware support  
 861 (SOC): Now ensure that if the platform declares itself as hardware-  
 862 reduced  
 863 via the FADT, the following functions become NOOPs (and always return  
 864 AE\_OK) because ACPI is always enabled by definition on these machines:  
 865 AcpiEnable  
 866 AcpiDisable  
 867 AcpiHwGetMode  
 868 AcpiHwSetMode

870 Dynamic Object Repair: Implemented additional runtime repairs for  
 871 predefined name return values. Both of these repairs can simplify code in  
 872 the related device drivers that invoke these methods:  
 873 1) For the \_STR and \_MLS names, automatically repair/convert an ASCII  
 874 string to a Unicode buffer.  
 875 2) For the \_CRS, \_PRS, and \_DMA names, return a resource descriptor with  
 876 a  
 877 lone end tag descriptor in the following cases: A Return(0) was executed,  
 878 a null buffer was returned, or no object at all was returned (non-slack  
 879 mode only). Adds a new file, nsconvert.c  
 880 ACPICA BZ 998. Bob Moore, Lv Zheng.

882 Resource Manager: Added additional code to prevent possible infinite  
 883 loops  
 884 while traversing corrupted or ill-formed resource template buffers. Check  
 885 for zero-length resource descriptors in all code that loops through  
 886 resource templates (the length field is used to index through the  
 887 template). This change also hardens the external AcpiWalkResources and  
 888 AcpiWalkResourceBuffer interfaces.

890 Local Cache Manager: Enhanced the main data structure to eliminate an  
 891 unnecessary mechanism to access the next object in the list. Actually  
 892 provides a small performance enhancement for hosts that use the local  
 893 ACPICA cache manager. Jung-uk Kim.

895 Example Code and Data Size: These are the sizes for the OS-independent  
 896 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 897 debug version of the code includes the debug output trace mechanism and  
 898 has a much larger code and data size.

900 Previous Release:  
 901 Non-Debug Version: 94.5K Code, 25.4K Data, 119.9K Total  
 902 Debug Version: 182.3K Code, 75.0K Data, 257.3K Total  
 903 Current Release:  
 904 Non-Debug Version: 95.0K Code, 25.9K Data, 120.9K Total  
 905 Debug Version: 182.9K Code, 75.6K Data, 258.5K Total

#### 908 2) iASL Compiler/Disassembler and Tools:

910 iASL/Disassembler: Fixed several issues with the definition of the ACPI  
 911 5.0 RASF table (RAS Feature Table). This change incorporates late changes  
 912 that were made to the ACPI 5.0 specification.

914 iASL/Disassembler: Added full support for the following new ACPI tables:  
 915 1) The MTMR table (MID Timer Table)  
 916 2) The VRTC table (Virtual Real Time Clock Table).  
 917 Includes header file, disassembler, table compiler, and template support  
 918 for both tables.

920 iASL: Implemented compile-time validation of package objects returned by  
 921 predefined names. This new feature validates static package objects  
 922 returned by the various predefined names defined to return packages. Both  
 923 object types and package lengths are validated, for both parent packages  
 924 and sub-packages, if any. The code is similar in structure and behavior  
 925 to  
 926 the runtime repair mechanism within the AML interpreter and uses the  
 927 existing predefined name information table. Adds a new file, aslprepkg.c.  
 928 ACPICA BZ 938.

930 iASL: Implemented auto-detection of binary ACPI tables for disassembly.  
 931 This feature detects a binary file with a valid ACPI table header and  
 932 invokes the disassembler automatically. Eliminates the need to  
 933 specifically invoke the disassembler with the -d option. ACPICA BZ 862.

935 iASL/Disassembler: Added several warnings for the case where there are  
 936 unresolved control methods during the disassembly. This can potentially  
 937 cause errors when the output file is compiled, because the disassembler  
 938 assumes zero method arguments in these cases (it cannot determine the  
 939 actual number of arguments without resolution/definition of the method).

941 Debugger: Added support to display all resources with a single command.  
 942 Invocation of the resources command with no arguments will now display  
 943 all  
 944 resources within the current namespace.

946 AcpiHelp: Added descriptive text for each ACPICA exception code displayed  
 947 via the -e option.

949 -----  
 950 17 January 2013. Summary of changes for version 20130117:

#### 952 1) ACPICA Kernel-resident Subsystem:

954 Updated the AcpiGetSleepTypeData interface: Allow the \\_Sx methods to  
 955 return either 1 or 2 integers. Although the ACPI spec defines the \\_Sx  
 956 objects to return a package containing one integer, most BIOS code  
 957 returns  
 958 two integers and the previous code reflects that. However, we also need  
 959 to  
 960 support BIOS code that actually implements to the ACPI spec, and this  
 961 change reflects this.

963 Fixed two issues with the ACPI\_DEBUG\_PRINT macros:  
 964 1) Added the ACPI\_DO\_WHILE macro to the main DEBUG\_PRINT helper macro for  
 965 C compilers that require this support.  
 966 2) Renamed the internal ACPI\_DEBUG macro to ACPI\_DO\_DEBUG\_PRINT since  
 967 ACPI\_DEBUG is already used by many of the various hosts.

969 Updated all ACPICA copyrights and signons to 2013. Added the 2013  
 970 copyright to all module headers and signons, including the standard Linux  
 971 header. This affects virtually every file in the ACPICA core subsystem,  
 972 iASL compiler, all ACPICA utilities, and the test suites.

974 Example Code and Data Size: These are the sizes for the OS-independent  
 975 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 976 debug version of the code includes the debug output trace mechanism and  
 977 has a much larger code and data size.

979 Previous Release:  
 980 Non-Debug Version: 94.5K Code, 25.5K Data, 120.0K Total  
 981 Debug Version: 182.2K Code, 74.9K Data, 257.1K Total  
 982 Current Release:  
 983 Non-Debug Version: 94.5K Code, 25.4K Data, 119.9K Total  
 984 Debug Version: 182.3K Code, 75.0K Data, 257.3K Total

#### 987 2) iASL Compiler/Disassembler and Tools:

989 Generic Unix OSL: Use a buffer to eliminate multiple vfprintf()s and  
 990 prevent a possible fault on some hosts. Some C libraries modify the arg  
 991 pointer parameter to vfprintf making it difficult to call it twice in the  
 992 AcpiOsVprintf function. Use a local buffer to workaround this issue. This  
 993 does not affect the Windows OSL since the Win C library does not modify  
 994 the arg pointer. Chao Guan, Bob Moore.

996 iASL: Fixed a possible infinite loop when the maximum error count is  
 997 reached. If an output file other than the .AML file is specified (such as  
 998 a listing file), and the maximum number of errors is reached, do not  
 999 attempt to flush data to the output file(s) as the compiler is aborting.  
 1000 This can cause an infinite loop as the max error count code essentially  
 1001 keeps calling itself.

1003 iASL/Disassembler: Added an option (-in) to ignore NOOP  
 1004 opcodes/operators.

1005 Implemented for both the compiler and the disassembler. Often, the NOOP  
 1006 opcode is used as padding for packages that are changed dynamically by  
 1007 the  
 1008 BIOS. When disassembled and recompiled, these NOOPs will cause syntax  
 1009 errors. This option causes the disassembler to ignore all NOOP opcodes  
 1010 (0xA3), and it also causes the compiler to ignore all ASL source code  
 1011 NOOP  
 1012 statements as well.

1014 Debugger: Enhanced the Sleep command to execute all sleep states. This  
 1015 change allows Sleep to be invoked with no arguments and causes the  
 1016 debugger to execute all of the sleep states, 0-5, automatically.

1018 -----  
 1019 20 December 2012. Summary of changes for version 20121220:

#### 1021 1) ACPICA Kernel-resident Subsystem:

1023 Implemented a new interface, AcpiWalkResourceBuffer. This interface is an  
 1024 alternate entry point for AcpiWalkResources and improves the usability of  
 1025 the resource manager by accepting as input a buffer containing the output  
 1026 of either a \_CRS, \_PRS, or \_AEI method. The key functionality is that the  
 1027 input buffer is not deleted by this interface so that it can be used by  
 1028 the host later. See the ACPICA reference for details.

1030 Interpreter: Add a warning if a 64-bit constant appears in a 32-bit table  
 1031 (DSDT version < 2). The constant will be truncated and this warning  
 1032 reflects that behavior.

1034 Resource Manager: Add support for the new ACPI 5.0 wake bit in the IRQ,  
 1035 ExtendedInterrupt, and GpioInt descriptors. This change adds support to  
 1036 both get and set the new wake bit in these descriptors, separately from  
 1037 the existing share bit. Reported by Aaron Lu.

1039 Interpreter: Fix Store() when an implicit conversion is not possible. For  
 1040 example, in the cases such as a store of a string to an existing package  
 1041 object, implement the store as a CopyObject(). This is a small departure  
 1042 from the ACPI specification which states that the control method should  
 1043 be  
 1044 aborted in this case. However, the ASLTS suite depends on this behavior.

1046 Performance improvement for the various FUNCTION\_TRACE and DEBUG\_PRINT  
 1047 macros: check if debug output is currently enabled as soon as possible to  
 1048 minimize performance impact if debug is in fact not enabled.

1050 Source code restructuring: Cleanup to improve modularity. The following  
 1051 new files have been added: dbconvert.c, evhandler.c, nsprepkg.c,  
 1052 psopinfo.c, psoobject.c, rsdumpinfo.c, utstring.c, and utownid.c.  
 1053 Associated makefiles and project files have been updated.

1055 Changed an exception code for LoadTable operator. For the case where one  
 1056 of the input strings is too long, change the returned exception code from  
 1057 AE\_BAD\_PARAMETER to AE\_AML\_STRING\_LIMIT.

1059 Fixed a possible memory leak in dispatcher error path. On error, delete  
 1060 the mutex object created during method mutex creation. Reported by  
 1061 tim.gardner@canonical.com.

1063 Example Code and Data Size: These are the sizes for the OS-independent  
 1064 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1065 debug version of the code includes the debug output trace mechanism and  
 1066 has a much larger code and data size.

1068	Previous Release:
1069	Non-Debug Version: 94.3K Code, 25.3K Data, 119.6K Total
1070	Debug Version: 175.5K Code, 74.5K Data, 250.0K Total
1071	Current Release:
1072	Non-Debug Version: 94.5K Code, 25.5K Data, 120.0K Total
1073	Debug Version: 182.2K Code, 74.9K Data, 257.1K Total

#### 1076 2) iASL Compiler/Disassembler and Tools:

1078 iASL: Disallow a method call as argument to the ObjectType ASL operator.  
 1079 This change tracks an errata to the ACPI 5.0 document. The AML grammar  
 1080 will not allow the interpreter to differentiate between a method and a  
 1081 method invocation when these are used as an argument to the ObjectType  
 1082 operator. The ACPI specification change is to disallow a method  
 1083 invocation  
 1084 (UserTerm) for the ObjectType operator.

1086 Finish support for the TPM2 and CSRT tables in the headers, table  
 1087 compiler, and disassembler.

1089 Unix user-space OSL: Fix a problem with WaitSemaphore where the timeout  
 1090 always expires immediately if the semaphore is not available. The  
 1091 original  
 1092 code was using a relative-time timeout, but sem\_timedwait requires the  
 1093 use  
 1094 of an absolute time.

1096 iASL: Added a remark if the Timer() operator is used within a 32-bit  
 1097 table. This operator returns a 64-bit time value that will be truncated  
 1098 within a 32-bit table.

1100 iASL Source code restructuring: Cleanup to improve modularity. The  
 1101 following new files have been added: aslhex.c, aslxref.c, aslnamesp.c,  
 1102 aslmethod.c, and aslfileio.c. Associated makefiles and project files have  
 1103 been updated.

1106 -----  
 1107 14 November 2012. Summary of changes for version 20121114:

#### 1109 1) ACPICA Kernel-resident Subsystem:

1111 Implemented a performance enhancement for ACPI/AML Package objects. This  
 1112 change greatly increases the performance of Package objects within the  
 1113 interpreter. It changes the processing of reference counts for packages  
 1114 by  
 1115 optimizing for the most common case where the package sub-objects are  
 1116 either Integers, Strings, or Buffers. Increases the overall performance  
 1117 of  
 1118 the ASLTS test suite by 1.5X (Increases the Slack Mode performance by  
 1119 2X.)  
 1120 Chao Guan. ACPICA BZ 943.

1122 Implemented and deployed common macros to extract flag bits from resource  
 1123 descriptors. Improves readability and maintainability of the code. Fixes  
 1124 a  
 1125 problem with the UART serial bus descriptor for the number of data bits  
 1126 flags (was incorrectly 2 bits, should be 3).

1128 Enhanced the ACPI\_GETx and ACPI\_SETx macros. Improved the implementation  
 1129 of the macros and changed the SETx macros to the style of (destination,  
 1130 source). Also added ACPI\_CASTx companion macros. Lv Zheng.

1132 Example Code and Data Size: These are the sizes for the OS-independent  
 1133 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1134 debug version of the code includes the debug output trace mechanism and  
 1135 has a much larger code and data size.

1137	Previous Release:
1138	Non-Debug Version: 93.9K Code, 25.2K Data, 119.1K Total
1139	Debug Version: 175.5K Code, 74.5K Data, 250.0K Total
1140	Current Release:
1141	Non-Debug Version: 94.3K Code, 25.3K Data, 119.6K Total
1142	Debug Version: 175.5K Code, 74.5K Data, 250.0K Total

#### 1145 2) iASL Compiler/Disassembler and Tools:

1147 Disassembler: Added the new ACPI 5.0 interrupt sharing flags. This change  
 1148 adds the ShareAndWake and ExclusiveAndWake flags which were added to the  
 1149 Irq, Interrupt, and Gpio resource descriptors in ACPI 5.0. ACPICA BZ 986.

1151 Disassembler: Fixed a problem with external declaration generation. Fixes  
 1152 a problem where an incorrect pathname could be generated for an external  
 1153 declaration if the original reference to the object includes leading  
 1154 carats (^). ACPICA BZ 984.

1156 Debugger: Completed a major update for the Disassemble<method> command.  
 1157 This command was out-of-date and did not properly disassemble control  
 1158 methods that had any reasonable complexity. This fix brings the command  
 1159 up  
 1160 to the same level as the rest of the disassembler. Adds one new file,  
 1161 dmdeferred.c, which is existing code that is now common with the main  
 1162 disassembler and the debugger disassemble command. ACPICA MZ 978.

1164 iASL: Moved the parser entry prototype to avoid a duplicate declaration.  
 1165 Newer versions of Bison emit this prototype, so moved the prototype out  
 1166 of  
 1167 the iASL header to where it is actually used in order to avoid a  
 1168 duplicate  
 1169 declaration.

#### 1171 iASL/Tools: Standardized use of the stream I/O functions:

1172 1) Ensure check for I/O error after every fopen/fread/fwrite  
 1173 2) Ensure proper order of size/count arguments for fread/fwrite  
 1174 3) Use test of (Actual != Requested) after all fwrite, and most fread  
 1175 4) Standardize I/O error messages  
 1176 Improves reliability and maintainability of the code. Bob Moore, Lv

1177 Zheng.  
 1178 ACPICA BZ 981.

1180 Disassembler: Prevent duplicate External() statements. During generation  
 1181 of external statements, detect similar pathnames that are actually  
 1182 duplicates such as these:  
 1183     External (\ABCD)  
 1184     External (ABCD)  
 1185 Remove all leading '\' characters from pathnames during the external  
 1186 statement generation so that duplicates will be detected and tossed.  
 1187 ACPICA BZ 985.

1189 Tools: Replace low-level I/O with stream I/O functions. Replace  
 1190 open/read/write/close with the stream I/O equivalents  
 1191 fopen/fread/fwrite/fclose for portability and performance. Lv Zheng, Bob  
 1192 Moore.

1194 AcpiBin: Fix for the dump-to-hex function. Now correctly output the table  
 1195 name header so that AcpiXtract recognizes the output file/table.

1197 iASL: Remove obsolete -2 option flag. Originally intended to force the  
 1198 compiler/disassembler into an ACPI 2.0 mode, this was never implemented  
 1199 and the entire concept is now obsolete.

1201 -----  
 1202 18 October 2012. Summary of changes for version 20121018:

1205 1) ACPICA Kernel-resident Subsystem:

1207 Updated support for the ACPI 5.0 MPST table. Fixes some problems  
 1208 introduced by late changes to the table as it was added to the ACPI 5.0  
 1209 specification. Includes header, disassembler, and data table compiler  
 1210 support as well as a new version of the MPST template.

1212 AcpiGetObjectInfo: Enhanced the device object support to include the ACPI  
 1213 5.0 \_SUB method. Now calls \_SUB in addition to the other PNP-related ID  
 1214 methods: \_HID, \_CID, and \_UID.

1216 Changed ACPI\_DEVICE\_ID to ACPI\_PNP\_DEVICE\_ID. Also changed  
 1217 ACPI\_DEVICE\_ID\_LIST to ACPI\_PNP\_DEVICE\_ID\_LIST. These changes prevent  
 1218 name collisions on hosts that reserve the \*\_DEVICE\_ID (or \*DeviceId)  
 1219 names for their various drivers. Affects the AcpiGetObjectInfo external  
 1220 interface, and other internal interfaces as well.

1222 Added and deployed a new macro for ACPI\_NAME management: ACPI\_MOVE\_NAME.  
 1223 This macro resolves to a simple 32-bit move of the 4-character ACPI\_NAME  
 1224 on machines that support non-aligned transfers. Optimizes for this case  
 1225 rather than using a strncpy. With assistance from Zheng Lv.

1227 Resource Manager: Small fix for buffer size calculation. Fixed a one byte  
 1228 error in the output buffer calculation. Feng Tang. ACPICA BZ 849.

1230 Added a new debug print message for AML mutex objects that are force-  
 1231 released. At control method termination, any currently acquired mutex  
 1232 objects are force-released. Adds a new debug-only message for each one  
 1233 that is released.

1235 Audited/updated all ACPICA return macros and the function debug depth  
 1236 counter: 1) Ensure that all functions that use the various TRACE macros  
 1237 also use the appropriate ACPICA return macros. 2) Ensure that all normal  
 1238 return statements surround the return expression (value) with parens to  
 1239 ensure consistency across the ACPICA code base. Guan Chao, Tang Feng,  
 1240 Zheng Lv, Bob Moore. ACPICA Bugzilla 972.

1242 Global source code changes/maintenance: All extra lines at the start and

1243 end of each source file have been removed for consistency. Also, within  
 1244 comments, all new sentences start with a single space instead of a double  
 1245 space, again for consistency across the code base.

1247 Example Code and Data Size: These are the sizes for the OS-independent  
 1248 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1249 debug version of the code includes the debug output trace mechanism and  
 1250 has a much larger code and data size.

1252 Previous Release:  
 1253 Non-Debug Version: 93.7K Code, 25.3K Data, 119.0K Total  
 1254 Debug Version: 175.0K Code, 74.4K Data, 249.4K Total  
 1255 Current Release:  
 1256 Non-Debug Version: 93.9K Code, 25.2K Data, 119.1K Total  
 1257 Debug Version: 175.5K Code, 74.5K Data, 250.0K Total

1260 2) iASL Compiler/Disassembler and Tools:

1262 AcpiExec: Improved the algorithm used for memory leak/corruption  
 1263 detection. Added some intelligence to the code that maintains the global  
 1264 list of allocated memory. The list is now ordered by allocated memory  
 1265 address, significantly improving performance. When running AcpiExec on  
 1266 the ASLTS test suite, speed improvements of 3X to 5X are seen, depending  
 1267 on the platform and/or the environment. Note, this performance  
 1268 enhancement affects the AcpiExec utility only, not the kernel-resident  
 1269 ACPICA code.

1271 Enhanced error reporting for invalid AML opcodes and bad ACPI\_NAMES. For  
 1272 the disassembler, dump the 48 bytes surrounding the invalid opcode. Fix  
 1273 incorrect table offset reported for invalid opcodes. Report the original  
 1274 32-bit value for bad ACPI\_NAMES (as well as the repaired name.)

1276 Disassembler: Enhanced the -vt option to emit the binary table data in  
 1277 hex format to assist with debugging.

1279 Fixed a potential filename buffer overflow in osunixdir.c. Increased the  
 1280 size of file structure. Colin Ian King.

1282 -----  
 1283 13 September 2012. Summary of changes for version 20120913:

1286 1) ACPICA Kernel-resident Subsystem:

1288 ACPI 5.0: Added two new notify types for the Hardware Error Notification  
 1289 Structure within the Hardware Error Source Table (HEST) table -- CMCI(5)  
 1290 and  
 1291 MCE(6).  
 1292  
 1293 Table Manager: Merged/removed duplicate code in the root table resize  
 1294 functions. One function is external, the other is internal. Lv Zheng,  
 1295 ACPICA  
 1296 BZ 846.

1298 Makefiles: Completely removed the obsolete "Linux" makefiles under  
 1299 acpica/generate/linux. These makefiles are obsolete and have been  
 1300 replaced  
 1301 by  
 1302 the generic unix makefiles under acpica/generate/unix.

1304 Makefiles: Ensure that binary files always copied properly. Minor rule  
 1305 change  
 1306 to ensure that the final binary output files are always copied up to the  
 1307 appropriate binary directory (bin32 or bin64.)

1309 Example Code and Data Size: These are the sizes for the OS-independent  
 1310 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1311 debug  
 1312 version of the code includes the debug output trace mechanism and has a  
 1313 much  
 1314 larger code and data size.

1316 Previous Release:  
 1317 Non-Debug Version: 93.8K Code, 25.3K Data, 119.1K Total  
 1318 Debug Version: 175.7K Code, 74.8K Data, 250.5K Total  
 1319 Current Release:  
 1320 Non-Debug Version: 93.7K Code, 25.3K Data, 119.0K Total  
 1321 Debug Version: 175.0K Code, 74.4K Data, 249.4K Total

#### 1324 2) iASL Compiler/Disassembler and Tools:

1326 Disassembler: Fixed a possible fault during the disassembly of resource  
 1327 descriptors when a second parse is required because of the invocation of  
 1328 external control methods within the table. With assistance from  
 1329 adq@lidskialf.net. ACPICA BZ 976.

1331 iASL: Fixed a namepath optimization problem. An error can occur if the  
 1332 parse  
 1333 node that contains the namepath to be optimized does not have a parent  
 1334 node  
 1335 that is a named object. This change fixes the problem.

1337 iASL: Fixed a regression where the AML file is not deleted on errors. The  
 1338 AML  
 1339 output file should be deleted if there are any errors during the  
 1340 compiler.  
 1341 The  
 1342 only exception is if the -f (force output) option is used. ACPICA BZ 974.

1344 iASL: Added a feature to automatically increase internal line buffer  
 1345 sizes.  
 1346 Via realloc(), automatically increase the internal line buffer sizes as  
 1347 necessary to support very long source code lines. The current version of  
 1348 the  
 1349 preprocessor requires a buffer long enough to contain full source code  
 1350 lines.  
 1351 This change increases the line buffer(s) if the input lines go beyond the  
 1352 current buffer size. This eliminates errors that occurred when a source  
 1353 code  
 1354 line was longer than the buffer.

1356 iASL: Fixed a problem with constant folding in method declarations. The  
 1357 SyncLevel term is a ByteConstExpr, and incorrect code would be generated  
 1358 if a  
 1359 Type3 opcode was used.

1361 Debugger: Improved command help support. For incorrect argument count,  
 1362 display  
 1363 full help for the command. For help command itself, allow an argument to  
 1364 specify a command.

1366 Test Suites: Several bug fixes for the ASLTS suite reduces the number of  
 1367 errors during execution of the suite. Guan Chao.

1369 -----  
 1370 16 August 2012. Summary of changes for version 20120816:

#### 1373 1) ACPICA Kernel-resident Subsystem:

1375 Removed all use of the deprecated \_GTS and \_BFS predefined methods. The  
 1376 \_GTS  
 1377 (Going To Sleep) and \_BFS (Back From Sleep) methods are essentially  
 1378 deprecated and will probably be removed from the ACPI specification.  
 1379 Windows  
 1380 does not invoke them, and reportedly never will. The final nail in the  
 1381 coffin  
 1382 is that the ACPI specification states that these methods must be run with  
 1383 interrupts off, which is not going to happen in a kernel interpreter.  
 1384 Note:  
 1385 Linux has removed all use of the methods also. It was discovered that  
 1386 invoking these functions caused failures on some machines, probably  
 1387 because  
 1388 they were never tested since Windows does not call them. Affects two  
 1389 external  
 1390 interfaces, AcpiEnterSleepState and AcpiLeaveSleepStatePrep. Tang Feng.  
 1391 ACPICA BZ 969.

1393 Implemented support for complex bit-packed buffers returned from the \_PLD  
 1394 (Physical Location of Device) predefined method. Adds a new external  
 1395 interface, AcpiDecodePldBuffer that parses the buffer into a more usable  
 1396 C  
 1397 structure. Note: C Bitfields cannot be used for this type of predefined  
 1398 structure since the memory layout of individual bitfields is not defined  
 1399 by  
 1400 the C language. In addition, there are endian concerns where a compiler  
 1401 will  
 1402 change the bitfield ordering based on the machine type. The new ACPICA  
 1403 interface eliminates these issues, and should be called after \_PLD is  
 1404 executed. ACPICA BZ 954.

1406 Implemented a change to allow a scope change to root (via "Scope (\)")  
 1407 during  
 1408 execution of module-level ASL code (code that is executed at table load  
 1409 time.) Lin Ming.

1411 Added the Windows8/Server2012 string for the \_OSI method. This change  
 1412 adds  
 1413 a  
 1414 new \_OSI string, "Windows 2012" for both Windows 8 and Windows Server  
 1415 2012.

1417 Added header support for the new ACPI tables DBG2 (Debug Port Table Type  
 1418 2)  
 1419 and CSRT (Core System Resource Table).

1421 Added struct header support for the \_FDE, \_GRT, \_GTM, and \_SRT predefined  
 1422 names. This simplifies access to the buffers returned by these predefined  
 1423 names. Adds a new file, include/acbuffer.h. ACPICA BZ 956.

1425 GPE support: Removed an extraneous parameter from the various low-level  
 1426 internal GPE functions. Tang Feng.

1428 Removed the linux makefiles from the unix packages. The generate/linux  
 1429 makefiles are obsolete and have been removed from the unix tarball  
 1430 release  
 1431 packages. The replacement makefiles are under generate/unix, and there is  
 1432 a  
 1433 top-level makefile under the main acpica directory. ACPICA BZ 967, 912.

#### 1435 Updates for Unix makefiles:

1436 1) Add -D FORTIFY\_SOURCE=2 for gcc generation. Arjan van de Ven.  
 1437 2) Update linker flags (move to end of command line) for AcpiExec  
 1438 utility.  
 1439 Guan Chao.

1441 Split ACPICA initialization functions to new file, utxfinit.c. Split from  
1442 utxface.c to improve modularity and reduce file size.

1444 Example Code and Data Size: These are the sizes for the OS-independent  
1445 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
1446 debug version of the code includes the debug output trace mechanism and  
1447 has a  
1448 much larger code and data size.

1450 Previous Release:  
1451 Non-Debug Version: 93.5K Code, 25.3K Data, 118.8K Total  
1452 Debug Version: 173.7K Code, 74.0K Data, 247.7K Total  
1453 Current Release:  
1454 Non-Debug Version: 93.8K Code, 25.3K Data, 119.1K Total  
1455 Debug Version: 175.7K Code, 74.8K Data, 250.5K Total

#### 1458 2) iASL Compiler/Disassembler and Tools:

1460 iASL: Fixed a problem with constant folding for fixed-length constant  
1461 expressions. The constant-folding code was not being invoked for constant  
1462 expressions that allow the use of type 3/4/5 opcodes to generate  
1463 constants  
1464 for expressions such as ByteConstExpr, WordConstExpr, etc. This could  
1465 result  
1466 in the generation of invalid AML bytecode. ACPICA BZ 970.

1468 iASL: Fixed a generation issue on newer versions of Bison. Newer versions  
1469 apparently automatically emit some of the necessary externals. This  
1470 change  
1471 handles these versions in order to eliminate generation warnings.

1473 Disassembler: Added support to decode the DBG2 and CSRT ACPI tables.

1475 Disassembler: Add support to decode \_PLD buffers. The decoded buffer  
1476 appears  
1477 within comments in the output file.

1479 Debugger: Fixed a regression with the "Threads" command where  
1480 AE\_BAD\_PARAMETER was always returned.

1482 -----  
1483 11 July 2012. Summary of changes for version 20120711:

#### 1485 1) ACPICA Kernel-resident Subsystem:

1487 Fixed a possible fault in the return package object repair code. Fixes a  
1488 problem that can occur when a lone package object is wrapped with an  
1489 outer  
1490 package object in order to force conformance to the ACPI specification.  
1491 Can  
1492 affect these predefined names: \_ALR, \_MLS, \_PSS, \_TRT, \_TSS, \_PRT, \_HPX,  
1493 \_DLM,  
1494 \_CSD, \_PSD, \_TSD.

1496 Removed code to disable/enable bus master arbitration (ARB\_DIS bit in the  
1497 PM2\_CNT register) in the ACPICA sleep/wake interfaces. Management of the  
1498 ARB\_DIS bit must be implemented in the host-dependent C3 processor power  
1499 state  
1500 support. Note, ARB\_DIS is obsolete and only applies to older chipsets,  
1501 both  
1502 Intel and other vendors. (for Intel: ICH4-M and earlier)

1504 This change removes the code to disable/enable bus master arbitration  
1505 during  
1506 suspend/resume. Use of the ARB\_DIS bit in the optional PM2\_CNT register

1507 causes  
1508 resume problems on some machines. The change has been in use for over  
1509 seven  
1510 years within Linux.

1512 Implemented two new external interfaces to support host-directed dynamic  
1513 ACPI  
1514 table load and unload. They are intended to simplify the host  
1515 implementation  
1516 of hot-plug support:  
1517 AcpiLoadTable: Load an SSDT from a buffer into the namespace.  
1518 AcpiUnloadParentTable: Unload an SSDT via a named object owned by the  
1519 table.  
1520 See the ACPICA reference for additional details. Adds one new file,  
1521 components/tables/tbxload.c

1523 Implemented and deployed two new interfaces for errors and warnings that  
1524 are  
1525 known to be caused by BIOS/firmware issues:  
1526 AcpiBiosError: Prints "ACPI Firmware Error" message.  
1527 AcpiBiosWarning: Prints "ACPI Firmware Warning" message.  
1528 Deployed these new interfaces in the ACPICA Table Manager code for ACPI  
1529 table  
1530 and FADT errors. Additional deployment to be completed as appropriate in  
1531 the  
1532 future. The associated conditional macros are ACPI\_BIOS\_ERROR and  
1533 ACPI\_BIOS\_WARNING. See the ACPICA reference for additional details.  
1534 ACPICA  
1535 BZ  
1536 843.

1538 Implicit notify support: ensure that no memory allocation occurs within a  
1539 critical region. This fix moves a memory allocation outside of the time  
1540 that a  
1541 spinlock is held. Fixes issues on systems that do not allow this  
1542 behavior.  
1543 Jung-uk Kim.

1545 Split exception code utilities and tables into a new file,  
1546 utilities/utexcept.c

1548 Example Code and Data Size: These are the sizes for the OS-independent  
1549 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
1550 debug  
1551 version of the code includes the debug output trace mechanism and has a  
1552 much  
1553 larger code and data size.

1555 Previous Release:  
1556 Non-Debug Version: 93.1K Code, 25.1K Data, 118.2K Total  
1557 Debug Version: 172.9K Code, 73.6K Data, 246.5K Total  
1558 Current Release:  
1559 Non-Debug Version: 93.5K Code, 25.3K Data, 118.8K Total  
1560 Debug Version: 173.7K Code, 74.0K Data, 247.7K Total

#### 1563 2) iASL Compiler/Disassembler and Tools:

1565 iASL: Fixed a parser problem for hosts where EOF is defined as -1 instead  
1566 of  
1567 0. Jung-uk Kim.

1569 Debugger: Enhanced the "tables" command to emit additional information  
1570 about  
1571 the current set of ACPI tables, including the owner ID and flags decode.

1573 Debugger: Reimplemented the "unload" command to use the new  
 1574 AcpiUnloadParentTable external interface. This command was disable  
 1575 previously  
 1576 due to need for an unload interface.

1578 AcpiHelp: Added a new option to decode ACPICA exception codes. The -e  
 1579 option  
 1580 will decode 16-bit hex status codes (ACPI\_STATUS) to name strings.

1582 -----  
 1583 20 June 2012. Summary of changes for version 20120620:

1586 1) ACPICA Kernel-resident Subsystem:

1588 Implemented support to expand the "implicit notify" feature to allow  
 1589 multiple  
 1590 devices to be notified by a single GPE. This feature automatically  
 1591 generates a  
 1592 runtime device notification in the absence of a BIOS-provided GPE control  
 1593 method (\_Lxx/\_Exx) or a host-installed handler for the GPE. Implicit  
 1594 notify is  
 1595 provided by ACPICA for Windows compatibility, and is a workaround for  
 1596 BIOS  
 1597 AML  
 1598 code errors. See the description of the AcpiSetupGpeForWake interface in  
 1599 the  
 1600 APCICA reference. Bob Moore, Rafael Wysocki. ACPICA BZ 918.

1602 Changed some comments and internal function names to simplify and ensure  
 1603 correctness of the Linux code translation. No functional changes.

1605 Example Code and Data Size: These are the sizes for the OS-independent  
 1606 apica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1607 debug  
 1608 version of the code includes the debug output trace mechanism and has a  
 1609 much  
 1610 larger code and data size.

1612 Previous Release:  
 1613 Non-Debug Version: 93.0K Code, 25.1K Data, 118.1K Total  
 1614 Debug Version: 172.7K Code, 73.6K Data, 246.3K Total  
 1615 Current Release:  
 1616 Non-Debug Version: 93.1K Code, 25.1K Data, 118.2K Total  
 1617 Debug Version: 172.9K Code, 73.6K Data, 246.5K Total

1620 2) iASL Compiler/Disassembler and Tools:

1622 Disassembler: Added support to emit short, commented descriptions for the  
 1623 ACPI  
 1624 predefined names in order to improve the readability of the disassembled  
 1625 output. ACPICA BZ 959. Changes include:  
 1626 1) Emit descriptions for all standard predefined names (\_INI, \_STA,  
 1627 \_PRW,  
 1628 etc.)  
 1629 2) Emit generic descriptions for the special names (\_Exx, \_Qxx, etc.)  
 1630 3) Emit descriptions for the resource descriptor names (\_MIN, \_LEN,  
 1631 etc.)

1633 AcpiSrc: Fixed several long-standing Linux code translation issues.  
 1634 Argument  
 1635 descriptions in function headers are now translated properly to lower  
 1636 case  
 1637 and  
 1638 underscores. ACPICA BZ 961. Also fixes translation problems such as

1639 these:  
 1640 (old -> new)  
 1641 i\_aSL -> iASL  
 1642 00-7\_f -> 00-7F  
 1643 16\_k -> 16K  
 1644 local\_fADT -> local\_FADT  
 1645 execute\_oSI -> execute\_OSI

1647 iASL: Fixed a problem where null bytes were inadvertently emitted into  
 1648 some  
 1649 listing files.

1651 iASL: Added the existing debug options to the standard help screen. There  
 1652 are  
 1653 no longer two different help screens. ACPICA BZ 957.

1655 AcpiHelp: Fixed some typos in the various predefined name descriptions.  
 1656 Also  
 1657 expand some of the descriptions where appropriate.

1659 iASL: Fixed the -ot option (display compile times/statistics). Was not  
 1660 working  
 1661 properly for standard output; only worked for the debug file case.

1663 -----  
 1664 18 May 2012. Summary of changes for version 20120518:

1667 1) ACPICA Core Subsystem:

1669 Added a new OSL interface, AcpiOsWaitEventsComplete. This interface is  
 1670 defined  
 1671 to block until asynchronous events such as notifies and GPEs have  
 1672 completed.  
 1673 Within ACPICA, it is only called before a notify or GPE handler is  
 1674 removed/uninstalled. It also may be useful for the host OS within related  
 1675 drivers such as the Embedded Controller driver. See the ACPICA reference  
 1676 for  
 1677 additional information. ACPICA BZ 868.

1679 ACPI Tables: Added a new error message for a possible overflow failure  
 1680 during  
 1681 the conversion of FADT 32-bit legacy register addresses to internal  
 1682 common  
 1683 64-  
 1684 bit GAS structure representation. The GAS has a one-byte "bit length"  
 1685 field,  
 1686 thus limiting the register length to 255 bits. ACPICA BZ 953.

1688 Example Code and Data Size: These are the sizes for the OS-independent  
 1689 apica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1690 debug  
 1691 version of the code includes the debug output trace mechanism and has a  
 1692 much  
 1693 larger code and data size.

1695 Previous Release:  
 1696 Non-Debug Version: 92.9K Code, 25.0K Data, 117.9K Total  
 1697 Debug Version: 172.6K Code, 73.4K Data, 246.0K Total  
 1698 Current Release:  
 1699 Non-Debug Version: 93.0K Code, 25.1K Data, 118.1K Total  
 1700 Debug Version: 172.7K Code, 73.6K Data, 246.3K Total

1703 2) iASL Compiler/Disassembler and Tools:

```

1705 iASL: Added the ACPI 5.0 "PCC" keyword for use in the Register() ASL
1706 macro.
1707 This keyword was added late in the ACPI 5.0 release cycle and was not
1708 implemented until now.

1710 Disassembler: Added support for Operation Region externals. Adds missing
1711 support for operation regions that are defined in another table, and
1712 referenced locally via a Field or BankField ASL operator. Now generates
1713 the
1714 correct External statement.

1716 Disassembler: Several additional fixes for the External() statement
1717 generation
1718 related to some ASL operators. Also, order the External() statements
1719 alphabetically in the disassembler output. Fixes the External()
1720 generation
1721 for
1722 the Create* field, Alias, and Scope operators:
1723 1) Create* buffer field operators - fix type mismatch warning on
1724 disassembly
1725 2) Alias - implement missing External support
1726 3) Scope - fix to make sure all necessary externals are emitted.

1728 iASL: Improved pathname support. For include files, merge the prefix
1729 pathname
1730 with the file pathname and eliminate unnecessary components. Convert
1731 backslashes in all pathnames to forward slashes, for readability. Include
1732 file
1733 pathname changes affect both #include and Include() type operators.

1735 iASL/DTC/Preprocessor: Gracefully handle early EOF. Handle an EOF at the
1736 end
1737 of a valid line by inserting a newline and then returning the EOF during
1738 the
1739 next call to GetNextLine. Prevents the line from being ignored due to EOF
1740 condition.

1742 iASL: Implemented some changes to enhance the IDE support (-vi option.)
1743 Error
1744 and Warning messages are now correctly recognized for both the source
1745 code
1746 browser and the global error and warning counts.

1748 -----
1749 20 April 2012. Summary of changes for version 20120420:

1752 1) ACPICA Core Subsystem:

1754 Implemented support for multiple notify handlers. This change adds
1755 support
1756 to
1757 allow multiple system and device notify handlers on Device, Thermal Zone,
1758 and
1759 Processor objects. This can simplify the host OS notification
1760 implementation.
1761 Also re-worked and restructured the entire notify support code to
1762 simplify
1763 handler installation, handler removal, notify event queuing, and notify
1764 dispatch to handler(s). Note: there can still only be two global notify
1765 handlers - one for system notifies and one for device notifies. There are
1766 no
1767 changes to the existing handler install/remove interfaces. Lin Ming, Bob
1768 Moore, Rafael Wysocki.

1770 Fixed a regression in the package repair code where the object reference

```

```

1771 count was calculated incorrectly. Regression was introduced in the commit
1772 "Support to add Package wrappers".

1774 Fixed a couple possible memory leaks in the AML parser, in the error
1775 recovery
1776 path. Jesper Juhl, Lin Ming.

1778 Example Code and Data Size: These are the sizes for the OS-independent
1779 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The
1780 debug version of the code includes the debug output trace mechanism and
1781 has a
1782 much larger code and data size.

1784 Previous Release:
1785 Non-Debug Version: 92.9K Code, 25.0K Data, 117.9K Total
1786 Debug Version: 172.5K Code, 73.2K Data, 245.7K Total
1787 Current Release:
1788 Non-Debug Version: 92.9K Code, 25.0K Data, 117.9K Total
1789 Debug Version: 172.6K Code, 73.4K Data, 246.0K Total

1792 2) iASL Compiler/Disassembler and Tools:

1794 iASL: Fixed a problem with the resource descriptor support where the
1795 length
1796 of the StartDependentFn and StartDependentFnNoPrio descriptors were not
1797 included in cumulative descriptor offset, resulting in incorrect values
1798 for
1799 resource tags within resource descriptors appearing after a
1800 StartDependent*
1801 descriptor. Reported by Petr Vandrovec. ACPICA BZ 949.

1803 iASL and Preprocessor: Implemented full support for the #line directive
1804 to
1805 correctly track original source file line numbers through the .i
1806 preprocessor
1807 output file - for error and warning messages.

1809 iASL: Expand the allowable byte constants for address space IDs.
1810 Previously,
1811 the allowable range was 0x80-0xFF (user-defined spaces), now the range is
1812 0x0A-0xFF to allow for custom and new IDs without changing the compiler.

1814 iASL: Add option to treat all warnings as errors (-we). ACPICA BZ 948.

1816 iASL: Add option to completely disable the preprocessor (-Pn).

1818 iASL: Now emit all error/warning messages to standard error (stderr) by
1819 default (instead of the previous stdout).

1821 ASL Test Suite (ASLTS): Reduce iASL warnings due to use of Switch().
1822 Update
1823 for resource descriptor offset fix above. Update/cleanup error output
1824 routines. Enable and send iASL errors/warnings to an error logfile
1825 (error.txt). Send all other iASL output to a logfile (compiler.txt).
1826 Fixed
1827 several extraneous "unrecognized operator" messages.

1829 -----
1830 20 March 2012. Summary of changes for version 20120320:

1833 1) ACPICA Core Subsystem:

1835 Enhanced the sleep/wake interfaces to optionally execute the _GTS method
1836 (Going To Sleep) and the _BFS method (Back From Sleep). Windows

```

1837 apparently  
 1838 does not execute these methods, and therefore these methods are often  
 1839 untested. It has been seen on some systems where the execution of these  
 1840 methods causes errors and also prevents the machine from entering S5. It  
 1841 is  
 1842 therefore suggested that host operating systems do not execute these  
 1843 methods  
 1844 by default. In the future, perhaps these methods can be optionally  
 1845 executed  
 1846 based on the age of the system and/or what is the newest version of  
 1847 Windows  
 1848 that the BIOS asks for via \_OSI. Changed interfaces: AcpiEnterSleepState  
 1849 and  
 1850 AcpiLeaveSleepStatePrep. See the ACPICA reference and Linux BZ 13041. Lin  
 1851 Ming.

1853 Fixed a problem where the length of the local/common FADT was set too  
 1854 early.  
 1855 The local FADT table length cannot be set to the common length until the  
 1856 original length has been examined. There is code that checks the table  
 1857 length  
 1858 and sets various fields appropriately. This can affect older machines  
 1859 with  
 1860 early FADT versions. For example, this can cause inadvertent writes to  
 1861 the  
 1862 CST\_CNT register. Julian Anastasov.

1864 Fixed a mapping issue related to a physical table override. Use the  
 1865 deferred  
 1866 mapping mechanism for tables loaded via the physical override OSL  
 1867 interface.  
 1868 This allows for early mapping before the virtual memory manager is  
 1869 available.  
 1870 Thomas Renninger, Bob Moore.

1872 Enhanced the automatic return-object repair code: Repair a common problem  
 1873 with  
 1874 predefined methods that are defined to return a variable-length Package  
 1875 of  
 1876 sub-objects. If there is only one sub-object, some BIOS ASL code  
 1877 mistakenly  
 1878 simply returns the single object instead of a Package with one sub-  
 1879 object.  
 1880 This new support will repair this error by wrapping a Package object  
 1881 around  
 1882 the original object, creating the correct and expected Package with one  
 1883 sub-  
 1884 object. Names that can be repaired in this manner include: \_ALR, \_CSD,  
 1885 \_HPX,  
 1886 \_MLS, \_PLD, \_PRT, \_PSS, \_TRT, \_TSS, \_BCL, \_DOD, \_FIX, and \_Sx. ACPICA BZ  
 1887 939.

1889 Changed the exception code returned for invalid ACPI paths passed as  
 1890 parameters to external interfaces such as AcpiEvaluateObject. Was  
 1891 AE\_BAD\_PARAMETER, now is the more sensible AE\_BAD\_PATHNAME.

1893 Example Code and Data Size: These are the sizes for the OS-independent  
 1894 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 1895 debug  
 1896 version of the code includes the debug output trace mechanism and has a  
 1897 much  
 1898 larger code and data size.

1900 Previous Release:  
 1901 Non-Debug Version: 93.0K Code, 25.0K Data, 118.0K Total  
 1902 Debug Version: 172.5K Code, 73.2K Data, 245.7K Total

1903 Current Release:  
 1904 Non-Debug Version: 92.9K Code, 25.0K Data, 117.9K Total  
 1905 Debug Version: 172.5K Code, 73.2K Data, 245.7K Total

## 1908 2) iASL Compiler/Disassembler and Tools:

1910 iASL: Added the infrastructure and initial implementation of a integrated  
 1911 C-  
 1912 like preprocessor. This will simplify BIOS development process by  
 1913 eliminating  
 1914 the need for a separate preprocessing step during builds. On Windows, it  
 1915 also  
 1916 eliminates the need to install a separate C compiler. ACPICA BZ 761. Some  
 1917 features including full #define() macro support are still under  
 1918 development.

1919 These preprocessor directives are supported:

```
1920 #define
1921 #elif
1922 #else
1923 #endif
1924 #error
1925 #if
1926 #ifdef
1927 #ifndef
1928 #include
1929 #pragma message
1930 #undef
1931 #warning
1932 In addition, these new command line options are supported:
1933 -D <symbol> Define symbol for preprocessor use
1934 -li Create preprocessed output file (*.i)
1935 -P Preprocess only and create preprocessor output file (*.i)
```

1937 Table Compiler: Fixed a problem where the equals operator within an  
 1938 expression  
 1939 did not work properly.

1941 Updated iASL to use the current versions of Bison/Flex. Updated the  
 1942 Windows  
 1943 project file to invoke these tools from the standard location. ACPICA BZ  
 1944 904.  
 1945 Versions supported:  
 1946 Flex for Windows: V2.5.4  
 1947 Bison for Windows: V2.4.1

1949 -----  
 1950 15 February 2012. Summary of changes for version 20120215:

## 1953 1) ACPICA Core Subsystem:

1955 There have been some major changes to the sleep/wake support code, as  
 1956 described below (a - e).

1958 a) The AcpiLeaveSleepState has been split into two interfaces, similar to  
 1959 AcpiEnterSleepStatePrep and AcpiEnterSleepState. The new interface is  
 1960 AcpiLeaveSleepStatePrep. This allows the host to perform actions between  
 1961 the  
 1962 time the \_BFS method is called and the \_WAK method is called. NOTE: all  
 1963 hosts  
 1964 must update their wake/resume code or else sleep/wake will not work  
 1965 properly.  
 1966 Rafael Wysocki.

1968 b) In AcpiLeaveSleepState, now enable all runtime GPEs before calling the

1969 `_WAK`  
 1970 method. Some machines require that the GPEs are enabled before the `_WAK`  
 1971 method  
 1972 is executed. Thomas Renninger.

1974 c) In `AcpiLeaveSleepState`, now always clear the `WAK_STS` (wake status)  
 1975 bit.  
 1976 Some BIOS code assumes that `WAK_STS` will be cleared on resume and use it  
 1977 to  
 1978 determine whether the system is rebooting or resuming. Matthew Garrett.

1980 d) Move the invocations of `_GTS` (Going To Sleep) and `_BFS` (Back From  
 1981 Sleep) to  
 1982 match the ACPI specification requirement. Rafael Wysocki.

1984 e) Implemented full support for the ACPI 5.0 `SleepStatus` and `SleepControl`  
 1985 registers within the V5 FADT. This support adds two new files:  
 1986 `hardware/hwesleep.c` implements the support for the new registers. Moved  
 1987 all  
 1988 `sleep/wake` external interfaces to `hardware/hwxfsleep.c`.

1991 Added a new OSL interface for ACPI table overrides,  
 1992 `AcpiOsPhysicalTableOverride`. This interface allows the host to override a  
 1993 table via a physical address, instead of the logical address required by  
 1994 `AcpiOsTableOverride`. This simplifies the host implementation. Initial  
 1995 implementation by Thomas Renninger. The ACPICA implementation creates a  
 1996 single  
 1997 shared function for table overrides that attempts both a logical and a  
 1998 physical override.

2000 Expanded the OSL memory read/write interfaces to 64-bit data  
 2001 (`AcpiOsReadMemory`, `AcpiOsWriteMemory`.) This enables full 64-bit memory  
 2002 transfer support for GAS register structures passed to `AcpiRead` and  
 2003 `AcpiWrite`.

2005 Implemented the `ACPI_REduced_HARdWARE` option to allow the creation of a  
 2006 custom  
 2007 build of ACPICA that supports only the ACPI 5.0 reduced hardware (SoC)  
 2008 model.  
 2009 See the ACPICA reference for details. ACPICA BZ 942. This option removes  
 2010 about  
 2011 10% of the code and 5% of the static data, and the following hardware  
 2012 ACPI  
 2013 features become unavailable:  
 2014 PM Event and Control registers  
 2015 SCI interrupt (and handler)  
 2016 Fixed Events  
 2017 General Purpose Events (GPEs)  
 2018 Global Lock  
 2019 ACPI PM timer  
 2020 FACS table (Waking vectors and Global Lock)

2022 Updated the unix tarball directory structure to match the ACPICA git  
 2023 source  
 2024 tree. This ensures that the generic unix makefiles work properly (in  
 2025 `generate/unix`). Also updated the Linux makefiles to match. ACPICA BZ  
 2026 867.

2028 Updated the return value of the `_REV` predefined method to integer value 5  
 2029 to  
 2030 reflect ACPI 5.0 support.

2032 Moved the external ACPI PM timer interface prototypes to the public  
 2033 `acpixf.h`  
 2034 file where they belong.

2036 Example Code and Data Size: These are the sizes for the OS-independent  
 2037 `acpica.lib` produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2038 debug  
 2039 version of the code includes the debug output trace mechanism and has a  
 2040 much  
 2041 larger code and data size.

2043 Previous Release:  
 2044 Non-Debug Version: 92.8K Code, 24.9K Data, 117.7K Total  
 2045 Debug Version: 171.7K Code, 72.9K Data, 244.5K Total  
 2046 Current Release:  
 2047 Non-Debug Version: 93.0K Code, 25.0K Data, 118.0K Total  
 2048 Debug Version: 172.5K Code, 73.2K Data, 245.7K Total

2051 2) iASL Compiler/Disassembler and Tools:

2053 Disassembler: Fixed a problem with the new ACPI 5.0 serial resource  
 2054 descriptors (I2C, SPI, UART) where the resource produce/consumer bit was  
 2055 incorrectly displayed.

2057 `AcpiHelp`: Add display of ACPI/PNP device IDs that are defined in the ACPI  
 2058 specification.

2060 -----  
 2061 11 January 2012. Summary of changes for version 20120111:

2064 1) ACPICA Core Subsystem:

2066 Implemented a new mechanism to allow host device drivers to check for  
 2067 address  
 2068 range conflicts with ACPI Operation Regions. Both `SystemMemory` and  
 2069 `SystemIO`  
 2070 address spaces are supported. A new external interface,  
 2071 `AcpiCheckAddressRange`,  
 2072 allows drivers to check an address range against the ACPI namespace. See  
 2073 the  
 2074 ACPICA reference for additional details. Adds one new file,  
 2075 `utilities/utaddress.c`. Lin Ming, Bob Moore.

2077 Fixed several issues with the ACPI 5.0 FADT support: Add the sleep  
 2078 Control  
 2079 and  
 2080 Status registers, update the ACPI 5.0 flags, and update internal data  
 2081 structures to handle an FADT larger than 256 bytes. The size of the ACPI  
 2082 5.0  
 2083 FADT is 268 bytes.

2085 Updated all ACPICA copyrights and signons to 2012. Added the 2012  
 2086 copyright to  
 2087 all module headers and signons, including the standard Linux header. This  
 2088 affects virtually every file in the ACPICA core subsystem, iASL compiler,  
 2089 and  
 2090 all ACPICA utilities.

2092 Example Code and Data Size: These are the sizes for the OS-independent  
 2093 `acpica.lib` produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2094 debug  
 2095 version of the code includes the debug output trace mechanism and has a  
 2096 much  
 2097 larger code and data size.

2099 Previous Release:  
 2100 Non-Debug Version: 92.3K Code, 24.9K Data, 117.2K Total

```

2101   Debug Version:      170.8K Code, 72.6K Data, 243.4K Total
2102   Current Release:
2103   Non-Debug Version:  92.8K Code, 24.9K Data, 117.7K Total
2104   Debug Version:      171.7K Code, 72.9K Data, 244.5K Total

2107 2) iASL Compiler/Disassembler and Tools:

2109 Disassembler: fixed a problem with the automatic resource tag generation
2110 support. Fixes a problem where the resource tags are inadvertently not
2111 constructed if the table being disassembled contains external references
2112 to
2113 control methods. Moved the actual construction of the tags to after the
2114 final
2115 namespace is constructed (after 2nd parse is invoked due to external
2116 control
2117 method references.) ACPICA BZ 941.

2119 Table Compiler: Make all "generic" operators caseless. These are the
2120 operators
2121 like UINT8, String, etc. Making these caseless improves ease-of-use.
2122 ACPICA BZ
2123 934.

2125 -----
2126 23 November 2011. Summary of changes for version 20111123:

2128 0) ACPI 5.0 Support:

2130 This release contains full support for the ACPI 5.0 specification, as
2131 summarized below.

2133 Reduced Hardware Support:
2134 -----

2136 This support allows for ACPI systems without the usual ACPI hardware.
2137 This
2138 support is enabled by a flag in the revision 5 FADT. If it is set, ACPICA
2139 will
2140 not attempt to initialize or use any of the usual ACPI hardware. Note,
2141 when
2142 this flag is set, all of the following ACPI hardware is assumed to be not
2143 present and is not initialized or accessed:

2145   General Purpose Events (GPEs)
2146   Fixed Events (PM1a/PM1b and PM Control)
2147   Power Management Timer and Console Buttons (power/sleep)
2148   Real-time Clock Alarm
2149   Global Lock
2150   System Control Interrupt (SCI)
2151   The FACS is assumed to be non-existent

2153 ACPI Tables:
2154 -----

2156 All new tables and updates to existing tables are fully supported in the
2157 ACPICA headers (for use by device drivers), the disassembler, and the
2158 iASL
2159 Data Table Compiler. ACPI 5.0 defines these new tables:

2161   BGRT          /* Boot Graphics Resource Table */
2162   DRPM          /* Dynamic Root of Trust for Measurement table */
2163   FPDPT         /* Firmware Performance Data Table */
2164   GTDT          /* Generic Timer Description Table */
2165   MPST          /* Memory Power State Table */
2166   PCCT          /* Platform Communications Channel Table */

```

```

2167   PMTT          /* Platform Memory Topology Table */
2168   RASF          /* RAS Feature table */

2170 Operation Regions/SpaceIDs:
2171 -----

2173 All new operation regions are fully supported by the iASL compiler, the
2174 disassembler, and the ACPICA runtime code (for dispatch to region
2175 handlers.)
2176 The new operation region Space IDs are:

2178   GeneralPurposeIo
2179   GenericSerialBus

2181 Resource Descriptors:
2182 -----

2184 All new ASL resource descriptors are fully supported by the iASL
2185 compiler,
2186 the
2187 ASL/AML disassembler, and the ACPICA runtime Resource Manager code
2188 (including
2189 all new predefined resource tags). New descriptors are:

2191   FixedDma
2192   GpioIo
2193   GpioInt
2194   I2cSerialBus
2195   SpiSerialBus
2196   UartSerialBus

2198 ASL/AML Operators, New and Modified:
2199 -----

2201 One new operator is added, the Connection operator, which is used to
2202 associate
2203 a GeneralPurposeIo or GenericSerialBus resource descriptor with
2204 individual
2205 field objects within an operation region. Several new protocols are
2206 associated
2207 with the AccessAs operator. All are fully supported by the iASL compiler,
2208 disassembler, and runtime ACPICA AML interpreter:

2210   Connection          // Declare Field Connection
2211   attributes
2212   AccessAs: AttribBytes (n)          // Read/Write N-Bytes Protocol
2213   AccessAs: AttribRawBytes (n)       // Raw Read/Write N-Bytes
2214   Protocol
2215   AccessAs: AttribRawProcessBytes (n) // Raw Process Call Protocol
2216   RawDataBuffer        // Data type for Vendor Data
2217   fields

2219 Predefined ASL/AML Objects:
2220 -----

2222 All new predefined objects/control-methods are supported by the iASL
2223 compiler
2224 and the ACPICA runtime validation/repair (arguments and return values.)
2225 New
2226 predefined names include the following:

2228 Standard Predefined Names (Objects or Control Methods):
2229   _AEI, _CLS, _CPC, _CWS, _DEP,
2230   _DLM, _EVT, _GCP, _CRT, _GWS,
2231   _HRV, _PRE, _PSE, _SRT, _SUB.

```

2233 Resource Tags (Names used to access individual fields within resource  
 2234 descriptors):  
 2235     \_DBT, \_DPL, \_DRS, \_END, \_FLC,  
 2236     \_IOR, \_LIN, \_MOD, \_PAR, \_PHA,  
 2237     \_PIN, \_PPI, \_POL, \_RXL, \_SLV,  
 2238     \_SPE, \_STB, \_TXL, \_VEN.

2240 ACPICA External Interfaces:  
 2241 -----

2243 Several new interfaces have been defined for use by ACPI-related device  
 2244 drivers and other host OS services:

2246 AcpiAcquireMutex and AcpiReleaseMutex: These interfaces allow the host OS  
 2247 to  
 2248 acquire and release AML mutexes that are defined in the DSDT/SSDT tables  
 2249 provided by the BIOS. They are intended to be used in conjunction with  
 2250 the  
 2251 ACPI 5.0 \_DLM (Device Lock Method) in order to provide transaction-level  
 2252 mutual exclusion with the AML code/interpreter.

2254 AcpiGetEventResources: Returns the (formatted) resource descriptors as  
 2255 defined  
 2256 by the ACPI 5.0 \_AEI object (ACPI Event Information). This object  
 2257 provides  
 2258 resource descriptors associated with hardware-reduced platform events,  
 2259 similar  
 2260 to the AcpiGetCurrentResources interface.

2262 Operation Region Handlers: For General Purpose IO and Generic Serial Bus  
 2263 operation regions, information about the Connection() object and any  
 2264 optional  
 2265 length information is passed to the region handler within the Context  
 2266 parameter.

2268 AcpiBufferToResource: This interface converts a raw AML buffer containing  
 2269 a  
 2270 resource template or resource descriptor to the ACPI\_RESOURCE internal  
 2271 format  
 2272 suitable for use by device drivers. Can be used by an operation region  
 2273 handler  
 2274 to convert the Connection() buffer object into a ACPI\_RESOURCE.

2276 Miscellaneous/Tools/TestSuites:  
 2277 -----

2279 Support for extended \_HID names (Four alpha characters instead of three).  
 2280 Support for ACPI 5.0 features in the AcpiExec and AcpiHelp utilities.  
 2281 Support for ACPI 5.0 features in the ASLTS test suite.  
 2282 Fully updated documentation (ACPICA and iASL reference documents.)

2284 ACPI Table Definition Language:  
 2285 -----

2287 Support for this language was implemented and released as a subsystem of  
 2288 the  
 2289 iASL compiler in 2010. (See the iASL compiler User Guide.)

2292 Non-ACPI 5.0 changes for this release:  
 2293 -----

2295 1) ACPICA Core Subsystem:

2297 Fix a problem with operation region declarations where a failure can  
 2298 occur

2299 if  
 2300 the region name and an argument that evaluates to an object (such as the  
 2301 region address) are in different namespace scopes. Lin Ming, ACPICA BZ  
 2302 937.

2304 Do not abort an ACPI table load if an invalid space ID is found within.  
 2305 This  
 2306 will be caught later if the offending method is executed. ACPICA BZ 925.

2308 Fixed an issue with the FFixedHW space ID where the ID was not always  
 2309 recognized properly (Both ACPICA and iASL). ACPICA BZ 926.

2311 Fixed a problem with the 32-bit generation of the unix-specific OSL  
 2312 (osunixxf.c). Lin Ming, ACPICA BZ 936.

2314 Several changes made to enable generation with the GCC 4.6 compiler.  
 2315 ACPICA BZ  
 2316 935.

2318 New error messages: Unsupported I/O requests (not 8/16/32 bit), and  
 2319 Index/Bank  
 2320 field registers out-of-range.

2322 2) iASL Compiler/Disassembler and Tools:

2324 iASL: Implemented the \_\_PATH\_\_ operator, which returns the full pathname  
 2325 of  
 2326 the current source file.

2328 AcpiHelp: Automatically display expanded keyword information for all ASL  
 2329 operators.

2331 Debugger: Add "Template" command to disassemble/dump resource template  
 2332 buffers.

2334 Added a new master script to generate and execute the ASLTS test suite.  
 2335 Automatically handles 32- and 64-bit generation. See tests/aslts.sh

2337 iASL: Fix problem with listing generation during processing of the  
 2338 Switch()  
 2339 operator where AML listing was disabled until the entire Switch block was  
 2340 completed.

2342 iASL: Improve support for semicolon statement terminators. Fix "invalid  
 2343 character" message for some cases when the semicolon is used. Semicolons  
 2344 are  
 2345 now allowed after every <Term> grammar element. ACPICA BZ 927.

2347 iASL: Fixed some possible aliasing warnings during generation. ACPICA BZ  
 2348 923.

2350 Disassembler: Fix problem with disassembly of the DataTableRegion  
 2351 operator  
 2352 where an inadvertent "Unhandled deferred opcode" message could be  
 2353 generated.

2355 3) Example Code and Data Size

2357 These are the sizes for the OS-independent acpica.lib produced by the  
 2358 Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code  
 2359 includes the debug output trace mechanism and has a much larger code and  
 2360 data  
 2361 size.

2363 Previous Release:  
 2364 Non-Debug Version: 90.2K Code, 23.9K Data, 114.1K Total

```

2365     Debug Version:      165.6K Code, 68.4K Data, 234.0K Total
2366     Current Release:
2367     Non-Debug Version:   92.3K Code, 24.9K Data, 117.2K Total
2368     Debug Version:      170.8K Code, 72.6K Data, 243.4K Total

2370 -----
2371 22 September 2011. Summary of changes for version 20110922:

2373 0) ACPI 5.0 News:

2375 Support for ACPI 5.0 in ACPICA has been underway for several months and
2376 will
2377 be released at the same time that ACPI 5.0 is officially released.

2379 The ACPI 5.0 specification is on track for release in the next few
2380 months.
2381
2382 1) ACPICA Core Subsystem:

2384 Fixed a problem where the maximum sleep time for the Sleep() operator was
2385 intended to be limited to two seconds, but was inadvertently limited to
2386 20
2387 seconds instead.

2389 Linux and Unix makefiles: Added header file dependencies to ensure
2390 correct
2391 generation of ACPICA core code and utilities. Also simplified the
2392 makefiles
2393 considerably through the use of the vpath variable to specify search
2394 paths.
2395 ACPICA BZ 924.

2397 2) iASL Compiler/Disassembler and Tools:

2399 iASL: Implemented support to check the access length for all fields
2400 created to
2401 access named Resource Descriptor fields. For example, if a resource field
2402 is
2403 defined to be two bits, a warning is issued if a CreateXxxxField() is
2404 used
2405 with an incorrect bit length. This is implemented for all current
2406 resource
2407 descriptor names. ACPICA BZ 930.
2408
2409 Disassembler: Fixed a byte ordering problem with the output of 24-bit and
2410 56-
2411 bit integers.

2413 iASL: Fixed a couple of issues associated with variable-length package
2414 objects. 1) properly handle constants like One, Ones, Zero -- do not make
2415 a
2416 VAR_PACKAGE when these are used as a package length. 2) Allow the
2417 VAR_PACKAGE
2418 opcode (in addition to PACKAGE) when validating object types for
2419 predefined
2420 names.

2422 iASL: Emit statistics for all output files (instead of just the ASL input
2423 and
2424 AML output). Includes listings, hex files, etc.

2426 iASL: Added -G option to the table compiler to allow the compilation of
2427 custom
2428 ACPI tables. The only part of a table that is required is the standard
2429 36-
2430 byte

```

```

2431 ACPI header.

2433 AcpiXtract: Ported to the standard ACPICA environment (with ACPICA
2434 headers),
2435 which also adds correct 64-bit support. Also, now all output filenames
2436 are
2437 completely lower case.

2439 AcpiExec: Ignore any non-AML tables (tables other than DSDT or SSDT) when
2440 loading table files. A warning is issued for any such tables. The only
2441 exception is an FADT. This also fixes a possible fault when attempting to
2442 load
2443 non-AML tables. ACPICA BZ 932.

2445 AcpiHelp: Added the AccessAs and Offset operators. Fixed a problem where
2446 a
2447 missing table terminator could cause a fault when using the -p option.

2449 AcpiSrc: Fixed a possible divide-by-zero fault when generating file
2450 statistics.

2452 3) Example Code and Data Size

2454 These are the sizes for the OS-independent acpica.lib produced by the
2455 Microsoft Visual C++ 9.0 32-bit compiler. The debug version of the code
2456 includes the debug output trace mechanism and has a much larger code and
2457 data
2458 size.

2460 Previous Release (VC 9.0):
2461 Non-Debug Version:   90.2K Code, 23.9K Data, 114.1K Total
2462 Debug Version:      165.6K Code, 68.4K Data, 234.0K Total
2463 Current Release (VC 9.0):
2464 Non-Debug Version:   90.2K Code, 23.9K Data, 114.1K Total
2465 Debug Version:      165.6K Code, 68.4K Data, 234.0K Total

2468 -----
2469 23 June 2011. Summary of changes for version 20110623:

2471 1) ACPI CA Core Subsystem:

2473 Updated the predefined name repair mechanism to not attempt repair of a
2474 _TSS
2475 return object if a _PSS object is present. We can only sort the _TSS
2476 return
2477 package if there is no _PSS within the same scope. This is because if
2478 _PSS
2479 is
2480 present, the ACPI specification dictates that the _TSS Power Dissipation
2481 field
2482 is to be ignored, and therefore some BIOSs leave garbage values in the
2483 _TSS
2484 Power field(s). In this case, it is best to just return the _TSS package
2485 as-
2486 is. Reported by, and fixed with assistance from Fenghua Yu.

2488 Added an option to globally disable the control method return value
2489 validation
2490 and repair. This runtime option can be used to disable return value
2491 repair
2492 if
2493 this is causing a problem on a particular machine. Also added an option
2494 to
2495 AcpiExec (-dr) to set this disable flag.

```

2497 All makefiles and project files: Major changes to improve generation of  
 2498 ACPICA  
 2499 tools. ACPICA BZ 912:  
 2500     Reduce default optimization levels to improve compatibility  
 2501     For Linux, add strict-aliasing=0 for gcc 4  
 2502     Cleanup and simplify use of command line defines  
 2503     Cleanup multithread library support  
 2504     Improve usage messages

2506 Linux-specific header: update handling of THREAD\_ID and pthread. For the  
 2507 32-  
 2508 bit case, improve casting to eliminate possible warnings, especially with  
 2509 the  
 2510 acpica tools.

2512 Example Code and Data Size: These are the sizes for the OS-independent  
 2513 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2514 debug  
 2515 version of the code includes the debug output trace mechanism and has a  
 2516 much  
 2517 larger code and data size.

2519 Previous Release (VC 9.0):  
 2520     Non-Debug Version: 90.1K Code, 23.9K Data, 114.0K Total  
 2521     Debug Version: 165.6K Code, 68.4K Data, 234.0K Total  
 2522 Current Release (VC 9.0):  
 2523     Non-Debug Version: 90.2K Code, 23.9K Data, 114.1K Total  
 2524     Debug Version: 165.6K Code, 68.4K Data, 234.0K Total

#### 2526 2) iASL Compiler/Disassembler and Tools:

2528 With this release, a new utility named "acpihelp" has been added to the  
 2529 ACPICA  
 2530 package. This utility summarizes the ACPI specification chapters for the  
 2531 ASL  
 2532 and AML languages. It generates under Linux/Unix as well as Windows, and  
 2533 provides the following functionality:  
 2534     Find/display ASL operator(s) -- with description and syntax.  
 2535     Find/display ASL keyword(s) -- with exact spelling and descriptions.  
 2536     Find/display ACPI predefined name(s) -- with description, number  
 2537     of arguments, and the return value data type.  
 2538     Find/display AML opcode name(s) -- with opcode, arguments, and  
 2539 grammar.  
 2540     Decode/display AML opcode -- with opcode name, arguments, and  
 2541 grammar.

2543 Service Layers: Make multi-thread support configurable. Conditionally  
 2544 compile  
 2545 the multi-thread support so that threading libraries will not be linked  
 2546 if  
 2547 not  
 2548 necessary. The only tool that requires multi-thread support is AcpiExec.

2550 iASL: Update yyerror/AslCompilerError for "const" errors. Newer versions  
 2551 of  
 2552 Bison appear to want the interface to yyerror to be a const char \* (or at  
 2553 least this is a problem when generating iASL on some systems.) ACPICA BZ  
 2554 923  
 2555 Pierre Lejeune.

2557 Tools: Fix for systems where O\_BINARY is not defined. Only used for  
 2558 Windows  
 2559 versions of the tools.

2561 -----  
 2562 27 May 2011. Summary of changes for version 20110527:

#### 2564 1) ACPI CA Core Subsystem:

2566 ASL Load() operator: Reinstate most restrictions on the incoming ACPI  
 2567 table  
 2568     8 ASL Load() operator: Reinstate most restrictions on the incoming ACPI table  
 2569 signature. Now, only allow SSDT, OEMx, and a null signature. History:  
 2570     1) Originally, we checked the table signature for "SSDT" or "PSDT".  
 2571         (PSDT is now obsolete.)  
 2572     2) We added support for OEMx tables, signature "OEM" plus a fourth  
 2573         "don't care" character.  
 2574     3) Valid tables were encountered with a null signature, so we just  
 2575         gave up on validating the signature, (05/2008).  
 2576     4) We encountered non-AML tables such as the MADT, which caused  
 2577         interpreter errors and kernel faults. So now, we once again allow  
 2578         only SSDT, OEMx, and now, also a null signature. (05/2011).

2579 Added the missing \_TDL predefined name to the global name list in order  
 2580 to  
 2581 enable validation. Affects both the core ACPICA code and the iASL  
 2582 compiler.  
 2583     20 Added the missing \_TDL predefined name to the global name list in order to  
 2584     21 enable validation. Affects both the core ACPICA code and the iASL compiler.

2584 Example Code and Data Size: These are the sizes for the OS-independent  
 2585 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2586 debug  
 2587 version of the code includes the debug output trace mechanism and has a  
 2588 much  
 2589     24 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug  
 2590     25 version of the code includes the debug output trace mechanism and has a much  
 2591     26 larger code and data size.

2591 Previous Release (VC 9.0):  
 2592     Non-Debug Version: 90.0K Code, 23.8K Data, 113.8K Total  
 2593     Debug Version: 164.5K Code, 68.0K Data, 232.5K Total  
 2594 Current Release (VC 9.0):  
 2595     Non-Debug Version: 90.1K Code, 23.9K Data, 114.0K Total  
 2596     Debug Version: 165.6K Code, 68.4K Data, 234.0K Total

#### 2598 2) iASL Compiler/Disassembler and Tools:

2600 Debugger/AcpiExec: Implemented support for "complex" method arguments on  
 2601 the  
 2602 debugger command line. This adds support beyond simple integers --  
 2603 including  
 2604     37 Debugger/AcpiExec: Implemented support for "complex" method arguments on the  
 2605     38 debugger command line. This adds support beyond simple integers -- including  
 2606     39 Strings, Buffers, and Packages. Includes support for nested packages.  
 2607     40 Increased the default command line buffer size to accommodate these  
 2608     41 arguments.  
 2609     42 Increased the default command line buffer size to accommodate these arguments.  
 2610 See the ACPICA reference for details and syntax. ACPICA BZ 917.  
 2611 Debugger/AcpiExec: Implemented support for "default" method arguments for  
 2612 the  
 2613 Execute/Debug command. Now, the debugger will always invoke a control  
 2614 method  
 2615 with the required number of arguments -- even if the command line  
 2616 specifies  
 2617 none or insufficient arguments. It uses default integer values for any  
 2618 missing  
 2619     43 Debugger/AcpiExec: Implemented support for "default" method arguments for the  
 2620     44 Execute/Debug command. Now, the debugger will always invoke a control method  
 2621     45 with the required number of arguments -- even if the command line specifies  
 2622     46 none or insufficient arguments. It uses default integer values for any missing

2617 arguments. Also fixes a bug where only six method arguments maximum were  
2618 supported instead of the required seven.

2620 **Debugger/AcpiExec: Add a maximum buffer length parameter to AcpiOsGetLine**  
2621 **and**  
2622 *50 Debugger/AcpiExec: Add a maximum buffer length parameter to AcpiOsGetLine and*  
2623 *also return status in order to prevent buffer overruns. See the ACPICA*  
2623 *reference for details and syntax. ACPICA BZ 921*

2625 iASL: Cleaned up support for Berkeley yacc. A general cleanup of code and  
2626 makefiles to simplify support for the two different but similar parser  
2627 generators, bison and yacc.

2629 **Updated the generic unix makefile for gcc 4. The default gcc version is**  
2630 **now**  
2631 *58 Updated the generic unix makefile for gcc 4. The default gcc version is now*  
2631 *expected to be 4 or greater, since options specific to gcc 4 are used.*

2633 -----  
2634 13 April 2011. Summary of changes for version 20110413:

2636 1) ACPI CA Core Subsystem:

2638 **Implemented support to execute a so-called "orphan" \_REG method under the**  
2639 *66 Implemented support to execute a so-called "orphan" \_REG method under the EC*  
2640 *device. This change will force the execution of a \_REG method underneath the*  
2641 **EC**  
2642 **device. This change will force the execution of a \_REG method underneath**  
2643 **the**  
2644 **EC**  
2645 device even if there is no corresponding operation region of type  
2646 EmbeddedControl. Fixes a problem seen on some machines and apparently is  
2647 compatible with Windows behavior. ACPICA BZ 875.

2647 **Added more predefined methods that are eligible for automatic NULL**  
2648 **package**  
2649 **element removal. This change adds another group of predefined names to**  
2650 **the**  
2651 *73 Added more predefined methods that are eligible for automatic NULL package*  
2652 *element removal. This change adds another group of predefined names to the*  
2653 **list**  
2654 **of names that can be repaired by having NULL package elements dynamically**  
2655 **removed. This group are those methods that return a single variable-**  
2656 **length**  
2657 **package containing simple data types such as integers, buffers, strings.**  
2658 **This**  
2659 **includes: \_ALx, \_BCL, \_CID, \_DOD, \_EDL, \_FIX, \_PCL, \_PLD, \_PMD, \_PRx,**  
2660 **\_PSL,**  
2661 *77 removed. This group are those methods that return a single variable-length*  
2662 *package containing simple data types such as integers, buffers, strings. This*  
2663 *includes: \_ALx, \_BCL, \_CID, \_DOD, \_EDL, \_FIX, \_PCL, \_PLD, \_PMD, \_PRx, \_PSL,*  
2664 *\_Sx,*  
2665 **and \_TZD. ACPICA BZ 914.**

2662 Split and segregated all internal global lock functions to a new file,  
2663 evglock.c.

2665 **Updated internal address SpaceID for DataTable regions. Moved this**  
2666 **internal**  
2667 *86 Updated internal address SpaceID for DataTable regions. Moved this internal*  
2668 **space**  
2669 **id in preparation for ACPI 5.0 changes that will include some new space**  
2670 **IDs.**  
2671 *88 id in preparation for ACPI 5.0 changes that will include some new space IDs.*  
2672 **This**  
2673 **change should not affect user/host code.**

2673 Example Code and Data Size: These are the sizes for the OS-independent  
2674 acpica.lib  
2675 **produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug**  
2676 **version of**  
2677 **the code includes the debug output trace mechanism and has a much larger**  
2678 **code**  
2679 *94 produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of*  
2680 *95 the code includes the debug output trace mechanism and has a much larger code*  
2681 **and**  
2682 **data size.**

2682 Previous Release (VC 9.0):  
2683 Non-Debug Version: 89.8K Code, 23.8K Data, 113.6K Total  
2684 Debug Version: 164.2K Code, 67.9K Data, 232.1K Total  
2685 Current Release (VC 9.0):  
2686 Non-Debug Version: 90.0K Code, 23.8K Data, 113.8K Total  
2687 Debug Version: 164.5K Code, 68.0K Data, 232.5K Total

2689 2) iASL Compiler/Disassembler and Tools:

2691 **iASL/DTC: Major update for new grammar features. Allow generic data types**  
2692 **in**  
2693 **custom ACPI tables. Field names are now optional. Any line can be split**  
2694 **to**  
2695 **multiple lines using the continuation char (\). Large buffers now use**  
2696 **line-**  
2697 *108 iASL/DTC: Major update for new grammar features. Allow generic data types in*  
2698 *109 custom ACPI tables. Field names are now optional. Any line can be split to*  
2699 *110 multiple lines using the continuation char (\). Large buffers now use line-*  
2700 *111 continuation character(s) and no colon on the continuation lines. See the*  
2701 **grammar**  
2702 **update in the iASL compiler reference. ACPI BZ 910,911. Lin Ming, Bob**  
2703 **Moore.**  
2704 *113 update in the iASL compiler reference. ACPI BZ 910,911. Lin Ming, Bob Moore.*

2702 **iASL: Mark ASL "Return()" and the simple "Return" as "Null" return**  
2703 **statements.**  
2704 **Since the parser stuffs a "zero" as the return value for these statements**  
2705 **(due**  
2706 *115 iASL: Mark ASL "Return()" and the simple "Return" as "Null" return statements.*  
2707 *116 Since the parser stuffs a "zero" as the return value for these statements (due*  
2708 **to**  
2709 **the underlying AML grammar), they were seen as "return with value" by the**  
2710 **iASL**  
2711 **semantic checking. They are now seen correctly as "null" return**  
2712 **statements.**  
2713 *118 the underlying AML grammar), they were seen as "return with value" by the iASL*  
2714 *119 semantic checking. They are now seen correctly as "null" return statements.*

2712 **iASL: Check if a \_REG declaration has a corresponding Operation Region.**  
2713 **Adds a**  
2714 **check for each \_REG to ensure that there is in fact a corresponding**  
2715 **operation**  
2716 *121 iASL: Check if a \_REG declaration has a corresponding Operation Region. Adds a*  
2717 *122 check for each \_REG to ensure that there is in fact a corresponding operation*  
2718 *123 region declaration in the same scope. If not, the \_REG method is not very*  
2719 **useful**  
2720 **since it probably won't be executed. ACPICA BZ 915.**

2720 **iASL/DTC: Finish support for expression evaluation. Added a new**  
2721 **expression**  
2722 *127 iASL/DTC: Finish support for expression evaluation. Added a new expression*  
2723 **parser**  
2724 **that implements c-style operator precedence and parenthesization. ACPICA**  
2725 **bugzilla**

2725 908.

2727 **Disassembler/DTC: Remove support for () and <> style comments in data**  
 2728 **tables.**  
 133 *Disassembler/DTC: Remove support for () and <> style comments in data tables.*  
 2729 Now  
 2730 **that DTC has full expression support, we don't want to have comment**  
 2731 **strings**  
 135 *that DTC has full expression support, we don't want to have comment strings*  
 2732 **that**  
 2733 **start with a parentheses or a less-than symbol. Now, only the standard /\***  
 2734 **and**  
 137 *start with a parentheses or a less-than symbol. Now, only the standard /\* and*  
 2735 *//*  
 2736 **comments are supported, as well as the bracket [] comments.**

2738 **AcpiXtract: Fix for RSDP and dynamic SSDT extraction. These tables have**  
 2739 **"unusual"**  
 2740 **headers in the acpidump file. Update the header validation to support**  
 2741 **these**  
 2742 **tables. Problem introduced in previous AcpiXtract version in the change**  
 2743 **to**  
 143 *headers in the acpidump file. Update the header validation to support these*  
 144 *tables. Problem introduced in previous AcpiXtract version in the change to*  
 2744 **support "wrong checksum" error messages emitted by acpidump utility.**

2746 **iASL: Add a \* option to generate all template files (as a synonym for**  
 2747 **ALL)**  
 2748 **as**  
 147 *iASL: Add a \* option to generate all template files (as a synonym for ALL) as*  
 2749 *in*  
 2750 **"iasl -T \*" or "iasl -T ALL".**

2752 **iASL/DTC: Do not abort compiler on fatal errors. We do not want to**  
 2753 **completely**  
 2754 **abort the compiler on "fatal" errors, simply should abort the current**  
 2755 **compile.**  
 151 *iASL/DTC: Do not abort compiler on fatal errors. We do not want to completely*  
 152 *abort the compiler on "fatal" errors, simply should abort the current compile.*  
 2756 **This allows multiple compiles with a single (possibly wildcard) compiler**  
 2757 **invocation.**

2759 -----

2760 16 March 2011. Summary of changes for version 20110316:

2762 1) ACPI CA Core Subsystem:

2764 **Fixed a problem caused by a \_PRW method appearing at the namespace root**  
 2765 **scope**  
 2766 **during the setup of wake GPEs. A fault could occur if a \_PRW directly**  
 2767 **under**  
 161 *Fixed a problem caused by a \_PRW method appearing at the namespace root scope*  
 162 *during the setup of wake GPEs. A fault could occur if a \_PRW directly under*  
 2768 *the*  
 2769 **root object was passed to the AcpiSetupGpeForWake interface. Lin Ming.**

2771 **Implemented support for "spurious" Global Lock interrupts. On some**  
 2772 **systems, a**  
 2773 **global lock interrupt can occur without the pending flag being set. Upon**  
 2774 **a**  
 2775 **GL**  
 2776 **interrupt, we now ensure that a thread is actually waiting for the lock**  
 2777 **before**  
 166 *Implemented support for "spurious" Global Lock interrupts. On some systems, a*  
 167 *global lock interrupt can occur without the pending flag being set. Upon a GL*  
 168 *interrupt, we now ensure that a thread is actually waiting for the lock before*

2778 signaling GL availability. Rafael Wysocki, Bob Moore.

2780 Example Code and Data Size: These are the sizes for the OS-independent  
 2781 acpica.lib  
 2782 **produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug**  
 2783 **version of**  
 2784 **the code includes the debug output trace mechanism and has a much larger**  
 2785 **code**  
 173 *produced by the Microsoft Visual C++ 9.0 32-bit compiler. The debug version of*  
 174 *the code includes the debug output trace mechanism and has a much larger code*  
 2786 *and*  
 2787 **data size.**

2789 Previous Release (VC 9.0):  
 2790 Non-Debug Version: 89.7K Code, 23.7K Data, 113.4K Total  
 2791 Debug Version: 163.9K Code, 67.5K Data, 231.4K Total  
 2792 Current Release (VC 9.0):  
 2793 Non-Debug Version: 89.8K Code, 23.8K Data, 113.6K Total  
 2794 Debug Version: 164.2K Code, 67.9K Data, 232.1K Total

2796 2) iASL Compiler/Disassembler and Tools:

2798 **Implemented full support for the "SLIC" ACPI table. Includes support in**  
 2799 **the**  
 2800 **header files, disassembler, table compiler, and template generator. Bob**  
 2801 **Moore,**  
 187 *Implemented full support for the "SLIC" ACPI table. Includes support in the*  
 188 *header files, disassembler, table compiler, and template generator. Bob Moore,*  
 2802 **Lin Ming.**

2804 **AcpiXtract: Correctly handle embedded comments and messages from**  
 2805 **AcpiDump.**  
 2806 **Apparently some or all versions of acpidump will occasionally emit a**  
 2807 **comment**  
 191 *AcpiXtract: Correctly handle embedded comments and messages from AcpiDump.*  
 192 *Apparently some or all versions of acpidump will occasionally emit a comment*  
 2808 *like*  
 2809 **"Wrong checksum", etc., into the dump file. This was causing problems for**  
 2810 **AcpiXtract. ACPICA BZ 905.**

2812 **iASL: Fix the Linux makefile by removing an inadvertent double file**  
 2813 **inclusion.**  
 197 *iASL: Fix the Linux makefile by removing an inadvertent double file inclusion.*  
 2814 **ACPICA BZ 913.**

2816 **AcpiExec: Update installation of operation region handlers. Install one**  
 2817 **handler**  
 2818 **for a user-defined address space. This is used by the ASL test suite**  
 2819 **(ASLTS).**  
 202 *for a user-defined address space. This is used by the ASL test suite (ASLTS).*

2821 -----

2822 11 February 2011. Summary of changes for version 20110211:

2824 1) ACPI CA Core Subsystem:

2826 **Added a mechanism to defer \_REG methods for some early-installed**  
 2827 **handlers.**  
 2828 **Most user handlers should be installed before call to**  
 2829 **AcpiEnableSubsystem.**  
 209 *Added a mechanism to defer \_REG methods for some early-installed handlers.*  
 210 *Most user handlers should be installed before call to AcpiEnableSubsystem.*  
 2830 **However, Event handlers and region handlers should be installed after**  
 2831 **AcpiInitializeObjects. Override handlers for the "default" regions should**  
 2832 **be**  
 212 *AcpiInitializeObjects. Override handlers for the "default" regions should be*

2833 installed early, however. This change executes all \_REG methods for the  
 2834 default regions (Memory/IO/PCI/DataTable) simultaneously to prevent any  
 2835 chicken/egg issues between them. ACPICA BZ 848.

2837 **Implemented an optimization for GPE detection. This optimization will**  
 2838 **simply**  
 2839 *217 Implemented an optimization for GPE detection. This optimization will simply*  
 2839 ignore GPE registers that contain no enabled GPEs -- there is no need to  
 2840 read the register since this information is available internally. This  
 2841 **becomes more important on machines with a large GPE space. ACPICA**  
 2842 **bugzilla**  
 2843 *220 becomes more important on machines with a large GPE space. ACPICA bugzilla*  
 2843 884. Lin Ming. Suggestion from Joe Liu.

2845 **Removed all use of the highly unreliable FADT revision field. The**  
 2846 **revision**  
 2847 **number in the FADT has been found to be completely unreliable and cannot**  
 2848 **be**  
 2849 **trusted. Only the actual table length can be used to infer the version.**  
 2850 **This**  
 2851 **change updates the ACPICA core and the disassembler so that both no**  
 2852 **longer**  
 2823 *223 Removed all use of the highly unreliable FADT revision field. The revision*  
 2824 *224 number in the FADT has been found to be completely unreliable and cannot be*  
 2825 *225 trusted. Only the actual table length can be used to infer the version. This*  
 2826 *226 change updates the ACPICA core and the disassembler so that both no longer*  
 2853 even look at the FADT version and instead depend solely upon the FADT  
 2854 length.

2856 **Fix an unresolved name issue for the no-debug and no-error-message source**  
 2857 **generation cases. The \_AcpiModuleName was left undefined in these cases,**  
 2858 **but**  
 2859 *231 generation cases. The \_AcpiModuleName was left undefined in these cases, but*  
 2859 it is actually needed as a parameter to some interfaces. Define  
 2860 \_AcpiModuleName as a null string in these cases. ACPICA Bugzilla 888.

2862 Split several large files (makefiles and project files updated)  
 2863 utglobal.c -> utdecode.c  
 2864 dbcomds.c -> dbmethod.c dbnames.c  
 2865 dsopcode.c -> dsargs.c dscontrol.c  
 2866 dsload.c -> dsload2.c  
 2867 aslanalyze.c -> asltypes.c aslwalks.c

2869 Example Code and Data Size: These are the sizes for the OS-independent  
 2870 acpica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2871 **debug version of the code includes the debug output trace mechanism and**  
 2872 **has**  
 2873 *244 debug version of the code includes the debug output trace mechanism and has*  
 2873 a much larger code and data size.

2875 Previous Release (VC 9.0):  
 2876 Non-Debug Version: 89.7K Code, 23.7K Data, 113.4K Total  
 2877 Debug Version: 163.9K Code, 67.5K Data, 231.4K Total  
 2878 Current Release (VC 9.0):  
 2879 Non-Debug Version: 89.7K Code, 23.7K Data, 113.4K Total  
 2880 Debug Version: 163.9K Code, 67.5K Data, 231.4K Total

2882 2) iASL Compiler/Disassembler and Tools:

2884 iASL: Implemented the predefined macros \_\_LINE\_\_, \_\_FILE\_\_, and \_\_DATE\_\_.  
 2885 These are useful C-style macros with the standard definitions. ACPICA  
 2886 bugzilla 898.

2888 **iASL/DTC: Added support for integer expressions and labels. Support for**  
 2889 **full**  
 2890 **expressions for all integer fields in all ACPI tables. Support for labels**

2891 **in**  
 260 *iASL/DTC: Added support for integer expressions and labels. Support for full*  
 261 *expressions for all integer fields in all ACPI tables. Support for labels in*  
 2892 "generic" portions of tables such as UEFI. See the iASL reference manual.

2894 Debugger: Added a command to display the status of global handlers. The  
 2895 "handlers" command will display op region, fixed event, and miscellaneous  
 2896 **global handlers. installation status -- and for op regions, whether**  
 2897 **default**  
 266 *global handlers. installation status -- and for op regions, whether default*  
 2898 or user-installed handler will be used.

2900 **iASL: Warn if reserved method incorrectly returns a value. Many**  
 2901 **predefined**  
 2902 **names are defined such that they do not return a value. If implemented as**  
 2903 **a**  
 269 *iASL: Warn if reserved method incorrectly returns a value. Many predefined*  
 270 *names are defined such that they do not return a value. If implemented as a*  
 2904 method, issue a warning if such a name explicitly returns a value. ACPICA  
 2905 Bugzilla 855.

2907 **iASL: Added detection of GPE method name conflicts. Detects a conflict**  
 2908 **where**  
 2909 **there are two GPE methods of the form \_Lxy and \_Exy in the same scope.**  
 2910 **(For**  
 274 *iASL: Added detection of GPE method name conflicts. Detects a conflict where*  
 275 *there are two GPE methods of the form \_Lxy and \_Exy in the same scope. (For*  
 2911 *example, \_L1d and \_E1d in the same scope.) ACPICA bugzilla 848.*

2913 iASL/DTC: Fixed a couple input scanner issues with comments and line  
 2914 **numbers. Comment remover could get confused and miss a comment ending.**  
 2915 **Fixed**  
 279 *numbers. Comment remover could get confused and miss a comment ending. Fixed*  
 2916 a problem with line counter maintenance.

2918 **iASL/DTC: Reduced the severity of some errors from fatal to error. There**  
 2919 **is**  
 282 *iASL/DTC: Reduced the severity of some errors from fatal to error. There is*  
 2920 no need to abort on simple errors within a field definition.

2922 **Debugger: Simplified the output of the help command. All help output now**  
 2923 **in**  
 285 *Debugger: Simplified the output of the help command. All help output now in*  
 2924 a single screen, instead of help subcommands. ACPICA Bugzilla 897.

2926 -----  
 2927 12 January 2011. Summary of changes for version 20110112:

2929 1) ACPI CA Core Subsystem:

2931 **Fixed a race condition between method execution and namespace walks that**  
 2932 **can**  
 293 *Fixed a race condition between method execution and namespace walks that can*  
 2933 possibly cause a fault. The problem was apparently introduced in version  
 2934 **20100528 as a result of a performance optimization that reduces the**  
 2935 **number**  
 2936 **of**  
 295 *20100528 as a result of a performance optimization that reduces the number of*  
 2937 namespace walks upon method exit by using the delete\_namespace\_subtree  
 2938 **function instead of the delete\_namespace\_by\_owner function used**  
 2939 **previously.**  
 297 *function instead of the delete\_namespace\_by\_owner function used previously.*  
 2940 Bug is a missing namespace lock in the delete\_namespace\_subtree function.  
 2941 dana.myers@oracle.com

2943 Fixed several issues and a possible fault with the automatic "serialized"

2944 **method support. History: This support changes a method to "serialized" on**  
 2945 **the**  
 302 *method support. History: This support changes a method to "serialized" on the*  
 2946 *fly if the method generates an AE\_ALREADY\_EXISTS error, indicating the*  
 2947 **possibility that it cannot handle reentrancy. This fix repairs a couple**  
 2948 **of**  
 304 *possibility that it cannot handle reentrancy. This fix repairs a couple of*  
 2949 *issues seen in the field, especially on machines with many cores:*

- 2951 1) Delete method children only upon the exit of the last thread,  
 2952 so as to not delete objects out from under other running threads  
 2953 (and possibly causing a fault.)
- 2954 2) Set the "serialized" bit for the method only upon the exit of the  
 2955 Last thread, so as to not cause deadlock when running threads  
 2956 attempt to exit.
- 2957 3) Cleanup the use of the AML "MethodFlags" and internal method flags  
 2958 so that there is no longer any confusion between the two.

2960 Lin Ming, Bob Moore. Reported by dana.myers@oracle.com.

2962 **Debugger: Now lock the namespace for duration of a namespace dump.**  
 2963 **Prevents**

318 *Debugger: Now lock the namespace for duration of a namespace dump. Prevents*  
 2964 *issues if the namespace is changing dynamically underneath the debugger.*  
 2965 *Especially affects temporary namespace nodes, since the debugger displays*  
 2966 *these also.*

2968 Updated the ordering of include files. The ACPICA headers should appear  
 2969 **before any compiler-specific headers (stdio.h, etc.) so that acenv.h can**  
 2970 **set**  
 2971 **any necessary compiler-specific defines, etc. Affects the ACPI-related**  
 2972 **tools**  
 324 *before any compiler-specific headers (stdio.h, etc.) so that acenv.h can set*  
 325 *any necessary compiler-specific defines, etc. Affects the ACPI-related tools*  
 2973 *and utilities.*

2975 **Updated all ACPICA copyrights and signons to 2011. Added the 2011**  
 2976 **copyright**  
 2977 **to all module headers and signons, including the Linux header. This**  
 2978 **affects**

328 *Updated all ACPICA copyrights and signons to 2011. Added the 2011 copyright*  
 329 *to all module headers and signons, including the Linux header. This affects*  
 2979 *virtually every file in the ACPICA core subsystem, iASL compiler, and all*  
 2980 *utilities.*

2982 Added project files for MS Visual Studio 2008 (VC++ 9.0). The original  
 2983 **project files for VC++ 6.0 are now obsolete. New project files can be**  
 2984 **found**

334 *project files for VC++ 6.0 are now obsolete. New project files can be found*  
 2985 *under acpica/generate/msvc9. See acpica/generate/msvc9/readme.txt for*  
 2986 *details.*

2988 Example Code and Data Size: These are the sizes for the OS-independent  
 2989 apcica.lib produced by the Microsoft Visual C++ 9.0 32-bit compiler. The  
 2990 **debug version of the code includes the debug output trace mechanism and**  
 2991 **has a**

340 *debug version of the code includes the debug output trace mechanism and has a*  
 2992 *much larger code and data size.*

2994 Previous Release (VC 6.0):  
 2995 Non-Debug Version: 89.8K Code, 18.9K Data, 108.7K Total  
 2996 Debug Version: 166.6K Code, 52.1K Data, 218.7K Total  
 2997 Current Release (VC 9.0):  
 2998 Non-Debug Version: 89.7K Code, 23.7K Data, 113.4K Total  
 2999 Debug Version: 163.9K Code, 67.5K Data, 231.4K Total

3001 2) iASL Compiler/Disassembler and Tools:

3003 **iASL: Added generic data types to the Data Table compiler. Add "generic"**  
 3004 **data**  
 3005 **types such as UINT32, String, Unicode, etc., to simplify the generation**  
 3006 **of**  
 352 *iASL: Added generic data types to the Data Table compiler. Add "generic" data*  
 353 *types such as UINT32, String, Unicode, etc., to simplify the generation of*  
 3007 *platform-defined tables such as UEFI. Lin Ming.*

3009 **iASL: Added listing support for the Data Table Compiler. Adds listing**  
 3010 **support**

356 *iASL: Added listing support for the Data Table Compiler. Adds listing support*  
 3011 *(-l) to display actual binary output for each line of input code.*

3013 -----  
 3014 09 December 2010. Summary of changes for version 20101209:

3016 1) ACPI CA Core Subsystem:

3018 **Completed the major overhaul of the GPE support code that was begun in**  
 3019 **July**

364 *Completed the major overhaul of the GPE support code that was begun in July*  
 3020 *2010. Major features include: removal of \_PRW execution in ACPICA (host*  
 3021 *executes \_PRWs anyway), cleanup of "wake" GPE interfaces and processing,*  
 3022 **changes to existing interfaces, simplification of GPE handler operation,**  
 3023 **and**  
 367 *changes to existing interfaces, simplification of GPE handler operation, and*  
 3024 *a handful of new interfaces:*

3026 AcpiUpdateAllGpes  
 3027 AcpiFinishGpe  
 3028 AcpiSetupGpeForWake  
 3029 AcpiSetGpeWakeMask  
 3030 One new file, evxfpe.c to consolidate all external GPE interfaces.

3032 See the ACPICA Programmer Reference for full details and programming  
 3033 **information. See the new section 4.4 "General Purpose Event (GPE)**  
 3034 **Support"**

3035 **for a full overview, and section 8.7 "ACPI General Purpose Event**  
 3036 **Management"**  
 3037 **for programming details. ACPICA BZ 858,870,877. Matthew Garrett, Lin**  
 3038 **Ming,**

377 *information. See the new section 4.4 "General Purpose Event (GPE) Support"*  
 378 *for a full overview, and section 8.7 "ACPI General Purpose Event Management"*  
 379 *for programming details. ACPICA BZ 858,870,877. Matthew Garrett, Lin Ming,*  
 3039 *Bob Moore, Rafael Wysocki.*

3041 **Implemented a new GPE feature for Windows compatibility, the "Implicit**  
 3042 **Wake**

3043 **GPE Notify". This feature will automatically issue a Notify(2) on a**  
 3044 **device**

382 *Implemented a new GPE feature for Windows compatibility, the "Implicit Wake*  
 383 *GPE Notify". This feature will automatically issue a Notify(2) on a device*  
 3045 *when a Wake GPE is received if there is no corresponding GPE method or*  
 3046 *handler. ACPICA BZ 870.*

3048 **Fixed a problem with the Scope() operator during table parse and load**  
 3049 **phase.**

3050 **During load phase (table load or method execution), the scope operator**  
 3051 **should**

3052 **not enter the target into the namespace. Instead, it should open a new**  
 3053 **scope**

387 *Fixed a problem with the Scope() operator during table parse and load phase.*  
 388 *During load phase (table load or method execution), the scope operator should*  
 389 *not enter the target into the namespace. Instead, it should open a new scope*

3054 at the target location. Linux BZ 19462, ACPICA BZ 882.

3056 Example Code and Data Size: These are the sizes for the OS-independent  
3057 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3058 **debug version of the code includes the debug output trace mechanism and**  
3059 **has a**  
3060 *394 debug version of the code includes the debug output trace mechanism and has a*  
3060 much larger code and data size.

3062 Previous Release:  
3063 Non-Debug Version: 89.8K Code, 18.9K Data, 108.7K Total  
3064 Debug Version: 166.6K Code, 52.1K Data, 218.7K Total  
3065 Current Release:  
3066 Non-Debug Version: 89.9K Code, 19.0K Data, 108.9K Total  
3067 Debug Version: 166.3K Code, 52.1K Data, 218.4K Total

3069 2) iASL Compiler/Disassembler and Tools:

3071 **iASL: Relax the alphanumeric restriction on \_CID strings. These strings**  
3072 **are**  
3073 **"bus-specific" per the ACPI specification, and therefore any characters**  
3074 **are**  
3075 **acceptable. The only checks that can be performed are for a null string**  
3076 **and**  
3077 *406 iASL: Relax the alphanumeric restriction on \_CID strings. These strings are*  
3077 *407 "bus-specific" per the ACPI specification, and therefore any characters are*  
3077 *408 acceptable. The only checks that can be performed are for a null string and*  
3077 *409 perhaps for a leading asterisk. ACPICA BZ 886.*

3079 iASL: Fixed a problem where a syntax error that caused a premature EOF  
3080 condition on the source file emitted a very confusing error message. The  
3081 premature EOF is now detected correctly. ACPICA BZ 891.

3083 **Disassembler: Decode the AccessSize within a Generic Address Structure**  
3084 **(byte**  
3085 *415 Disassembler: Decode the AccessSize within a Generic Address Structure (byte*  
3085 *access, word access, etc.) Note, this field does not allow arbitrary bit*  
3086 *access, the size is encoded as 1=byte, 2=word, 3=dword, and 4=qword.*

3088 **New: AcpiNames utility - Example namespace dump utility. Shows an example**  
3089 **of**  
3090 *419 New: AcpiNames utility - Example namespace dump utility. Shows an example of*  
3090 *ACPICA configuration for a minimal namespace dump utility. Uses table and*  
3091 *namespace managers, but no AML interpreter. Does not add any*  
3092 *functionality*  
3093 *421 namespace managers, but no AML interpreter. Does not add any functionality*  
3093 *over AcpiExec, it is a subset of AcpiExec. The purpose is to show how to*  
3094 *partition and configure ACPICA. ACPICA BZ 883.*

3096 **AML Debugger: Increased the debugger buffer size for method return**  
3097 **objects.**  
3098 **Was 4K, increased to 16K. Also enhanced error messages for debugger**  
3099 **method**  
3100 *425 AML Debugger: Increased the debugger buffer size for method return objects.*  
3100 *426 Was 4K, increased to 16K. Also enhanced error messages for debugger method*  
3100 *execution, including the buffer overflow case.*

3102 -----  
3103 13 October 2010. Summary of changes for version 20101013:

3105 1) ACPI CA Core Subsystem:

3107 **Added support to clear the PCIEXP\_WAKE event. When clearing ACPI events,**  
3108 **now**  
3109 *434 Added support to clear the PCIEXP\_WAKE event. When clearing ACPI events, now*  
3109 *clear the PCIEXP\_WAKE\_STS bit in the ACPI PM1 Status Register, via*

3110 HwClearAcpiStatus. Original change from Colin King. ACPICA BZ 880.

3112 **Changed the type of the predefined namespace object \_TZ from ThermalZone**  
3113 **to**  
3114 **Device. This was found to be confusing to the host software that**  
3115 **processes**  
3116 **the various thermal zones, since \_TZ is not really a ThermalZone.**  
3117 **However,**  
3118 **a**  
3119 *438 Changed the type of the predefined namespace object \_TZ from ThermalZone to*  
3119 *439 Device. This was found to be confusing to the host software that processes*  
3119 *440 the various thermal zones, since \_TZ is not really a ThermalZone. However, a*  
3119 *Notify() can still be performed on it. ACPICA BZ 876. Suggestion from Rui*  
3120 *Zhang.*

3122 Added Windows Vista SP2 to the list of supported \_OSI strings. The actual  
3123 string is "Windows 2006 SP2".

3125 **Eliminated duplicate code in AcpiUtExecute\* functions. Now that the**  
3126 **nsrepair**  
3127 *447 Eliminated duplicate code in AcpiUtExecute\* functions. Now that the nsrepair*  
3127 *code automatically repairs \_HID-related strings, this type of code is no*  
3128 *longer needed in Execute\_HID, Execute\_CID, and Execute\_UID. ACPICA BZ*  
3129 *878.*  
3129 *449 longer needed in Execute\_HID, Execute\_CID, and Execute\_UID. ACPICA BZ 878.*

3131 Example Code and Data Size: These are the sizes for the OS-independent  
3132 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3133 **debug version of the code includes the debug output trace mechanism and**  
3134 **has a**  
3135 *453 debug version of the code includes the debug output trace mechanism and has a*  
3135 much larger code and data size.

3137 Previous Release:  
3138 Non-Debug Version: 89.9K Code, 19.0K Data, 108.9K Total  
3139 Debug Version: 166.3K Code, 52.1K Data, 218.4K Total  
3140 Current Release:  
3141 Non-Debug Version: 89.9K Code, 19.0K Data, 108.9K Total  
3142 Debug Version: 166.3K Code, 52.1K Data, 218.4K Total

3144 2) iASL Compiler/Disassembler and Tools:

3146 **iASL: Implemented additional compile-time validation for \_HID strings.**  
3147 **The**  
3148 **non-hex prefix (such as "PNP" or "ACPI") must be uppercase, and the**  
3149 **length**  
3150 **of**  
3151 **the string must be exactly seven or eight characters. For both \_HID and**  
3152 **\_CID**  
3153 *465 iASL: Implemented additional compile-time validation for \_HID strings. The*  
3153 *466 non-hex prefix (such as "PNP" or "ACPI") must be uppercase, and the length of*  
3153 *467 the string must be exactly seven or eight characters. For both \_HID and \_CID*  
3153 *strings, all characters must be alphanumeric. ACPICA BZ 874.*

3155 iASL: Allow certain "null" resource descriptors. Some BIOS code creates  
3156 **descriptors that are mostly or all zeros, with the expectation that they**  
3157 **will**  
3158 **be filled in at runtime. iASL now allows this as long as there is a**  
3159 **"resource**  
3160 *471 descriptors that are mostly or all zeros, with the expectation that they will*  
3160 *472 be filled in at runtime. iASL now allows this as long as there is a "resource*  
3160 *tag" (name) associated with the descriptor, which gives the ASL a handle*  
3161 *needed to modify the descriptor. ACPICA BZ 873.*

3163 **Added single-thread support to the generic Unix application OSL.**  
3164 **Primarily**

3165 for iASL support, this change removes the use of semaphores in the  
 3166 single-  
 476 Added single-thread support to the generic Unix application OSL. Primarily  
 477 for iASL support, this change removes the use of semaphores in the single-  
 3167 threaded ACPICA tools/applications - increasing performance. The  
 3168 \_MULTI\_THREADED option was replaced by the (reverse) ACPI\_SINGLE\_THREADED  
 3169 option. ACPICA BZ 879.

3171 **AcpiExec: several fixes for the 64-bit version. Adds XSDT support and**  
 3172 **support**  
 482 AcpiExec: several fixes for the 64-bit version. Adds XSDT support and support  
 3173 for 64-bit DSDT/FACS addresses in the FADT. Lin Ming.

3175 iASL: Moved all compiler messages to a new file, aslmessages.h.

3177 -----  
 3178 15 September 2010. Summary of changes for version 20100915:

3180 1) ACPI CA Core Subsystem:

3182 **Removed the AcpiOsDerivePciId OSL interface. The various host**  
 3183 **implementations**  
 492 Removed the AcpiOsDerivePciId OSL interface. The various host implementations  
 3184 of this function were not OS-dependent and are now obsolete and can be  
 3185 removed from all host OSLs. This function has been replaced by  
 3186 AcpiHwDerivePciId, which is now part of the ACPICA core code.  
 3187 AcpiHwDerivePciId has been implemented without recursion. Adds one new  
 3188 module, hwpci.c. ACPICA BZ 857.

3190 Implemented a dynamic repair for \_HID and \_CID strings. The following  
 3191 problems are now repaired at runtime: 1) Remove a leading asterisk in the  
 3192 string, and 2) the entire string is uppercased. Both repairs are in  
 3193 accordance with the ACPI specification and will simplify host driver  
 3194 code.  
 502 accordance with the ACPI specification and will simplify host driver code.  
 3195 ACPICA BZ 871.

3197 The ACPI\_THREAD\_ID type is no longer configurable, internally it is now  
 3198 always UINT64. This simplifies the ACPICA code, especially any printf  
 3199 output.  
 506 always UINT64. This simplifies the ACPICA code, especially any printf output.  
 3200 UINT64 is the only common data type for all thread\_id types across all  
 3201 operating systems. It is now up to the host OSL to cast the native  
 3202 thread\_id  
 3203 type to UINT64 before returning the value to ACPICA (via  
 3204 AcpiOsGetThreadId).  
 508 operating systems. It is now up to the host OSL to cast the native thread\_id  
 509 type to UINT64 before returning the value to ACPICA (via AcpiOsGetThreadId).  
 3205 Lin Ming, Bob Moore.

3207 **Added the ACPI\_INLINE type to enhance the ACPICA configuration. The**  
 3208 **"inline"**  
 3209 keyword is not standard across compilers, and this type allows inline to  
 3210 be  
 512 Added the ACPI\_INLINE type to enhance the ACPICA configuration. The "inline"  
 513 keyword is not standard across compilers, and this type allows inline to be  
 3211 configured on a per-compiler basis. Lin Ming.

3213 **Made the system global AcpiGbl\_SystemAwakeAndRunning publically**  
 3214 **available.**  
 3215 Added an extern for this boolean in acpixf.h. Some hosts utilize this  
 3216 value  
 516 Made the system global AcpiGbl\_SystemAwakeAndRunning publically available.  
 517 Added an extern for this boolean in acpixf.h. Some hosts utilize this value  
 3217 during suspend/restore operations. ACPICA BZ 869.

3219 All code that implements error/warning messages with the "ACPI:" prefix  
 3220 has  
 520 All code that implements error/warning messages with the "ACPI:" prefix has  
 3221 been moved to a new module, utxferror.c.

3223 **The UINT64\_OVERLAY was moved to utmath.c, which is the only module where**  
 3224 **it**  
 523 The UINT64\_OVERLAY was moved to utmath.c, which is the only module where it  
 3225 is used. ACPICA BZ 829. Lin Ming, Bob Moore.

3227 Example Code and Data Size: These are the sizes for the OS-independent  
 3228 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 3229 debug version of the code includes the debug output trace mechanism and  
 3230 has a  
 528 debug version of the code includes the debug output trace mechanism and has a  
 3231 much larger code and data size.

3233 Previous Release:  
 3234 Non-Debug Version: 89.1K Code, 19.0K Data, 108.1K Total  
 3235 Debug Version: 165.1K Code, 51.9K Data, 217.0K Total  
 3236 Current Release:  
 3237 Non-Debug Version: 89.9K Code, 19.0K Data, 108.9K Total  
 3238 Debug Version: 166.3K Code, 52.1K Data, 218.4K Total

3240 2) iASL Compiler/Disassembler and Tools:

3242 **iASL/Disassembler: Write ACPI errors to stderr instead of the output**  
 3243 **file.**  
 3244 This keeps the output files free of random error messages that may  
 3245 originate  
 3246 from within the namespace/interpreter code. Used this opportunity to  
 3247 merge  
 540 iASL/Disassembler: Write ACPI errors to stderr instead of the output file.  
 541 This keeps the output files free of random error messages that may originate  
 542 from within the namespace/interpreter code. Used this opportunity to merge  
 3248 all ACPI:-style messages into a single new module, utxferror.c. ACPICA BZ  
 3249 866. Lin Ming, Bob Moore.

3251 **Tools: update some printf's for ansi warnings on size\_t. Handle width**  
 3252 **change**  
 546 Tools: update some printf's for ansi warnings on size\_t. Handle width change  
 3253 of size\_t on 32-bit versus 64-bit generations. Lin Ming.

3255 -----  
 3256 06 August 2010. Summary of changes for version 20100806:

3258 1) ACPI CA Core Subsystem:

3260 **Designed and implemented a new host interface to the \_OSI support code.**  
 3261 **This**  
 3262 will allow the host to dynamically add or remove multiple \_OSI strings,  
 3263 as  
 3264 well as install an optional handler that is called for each \_OSI  
 3265 invocation.  
 3266 Also added a new AML debugger command, 'osi' to display and modify the  
 3267 global  
 3268 \_OSI string table, and test support in the AcpiExec utility. See the  
 3269 ACPICA  
 554 Designed and implemented a new host interface to the \_OSI support code. This  
 555 will allow the host to dynamically add or remove multiple \_OSI strings, as  
 556 well as install an optional handler that is called for each \_OSI invocation.  
 557 Also added a new AML debugger command, 'osi' to display and modify the global  
 558 \_OSI string table, and test support in the AcpiExec utility. See the ACPICA  
 3270 reference manual for full details. Lin Ming, Bob Moore. ACPICA BZ 836.

3271 New Functions:  
 3272 AcpiInstallInterface - Add an \_OSI string.

```

3273     AcpiRemoveInterface - Delete an _OSI string.
3274     AcpiInstallInterfaceHandler - Install optional _OSI handler.
3275     Obsolete Functions:
3276     AcpiOsValidateInterface - no longer used.
3277     New Files:
3278     source/components/utilities/utosi.c

```

```

3280 Re-introduced the support to enable multi-byte transfers for Embedded
3281 Controller (EC) operation regions. A reported problem was found to be a
3282 bug
3283 in the host OS, not in the multi-byte support. Previously, the maximum
3284 data
3285 size passed to the EC operation region handler was a single byte. There
3286 are
3287 often EC Fields larger than one byte that need to be transferred, and it
3288 is
3289 useful for the EC driver to lock these as a single transaction. This
3290 change
3291 Controller (EC) operation regions. A reported problem was found to be a bug
3292 in the host OS, not in the multi-byte support. Previously, the maximum data
3293 size passed to the EC operation region handler was a single byte. There are
3294 often EC Fields larger than one byte that need to be transferred, and it is
3295 useful for the EC driver to lock these as a single transaction. This change
3296 enables single transfers larger than 8 bits. This effectively changes the
3297 access to the EC space from ByteAcc to AnyAcc, and will probably require
3298 changes to the host OS Embedded Controller driver to enable 16/32/64/256-bit
3299 bit
3300 changes to the host OS Embedded Controller driver to enable 16/32/64/256-bit
3301 transfers in addition to 8-bit transfers. Alexey Starikovskiy, Lin Ming.

```

```

3297 Fixed a problem with the prototype for AcpiOsReadPciConfiguration. The
3298 prototype in acpiosxf.h had the output value pointer as a (void *).
3299 It should be a (UINT64 *). This may affect some host OSL code.

```

```

3301 Fixed a couple problems with the recently modified Linux makefiles for
3302 iASL
3303 584 Fixed a couple problems with the recently modified Linux makefiles for iASL
3304 and AcpiExec. These new makefiles place the generated object files in the
3305 local directory so that there can be no collisions between the files that
3306 are
3307 586 local directory so that there can be no collisions between the files that are
3308 shared between them that are compiled with different options.

```

```

3308 Example Code and Data Size: These are the sizes for the OS-independent
3309 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The
3310 debug version of the code includes the debug output trace mechanism and
3311 has a
3312 591 debug version of the code includes the debug output trace mechanism and has a
3313 much larger code and data size.

```

```

3314 Previous Release:
3315 Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total
3316 Debug Version: 164.0K Code, 51.5K Data, 215.5K Total
3317 Current Release:
3318 Non-Debug Version: 89.1K Code, 19.0K Data, 108.1K Total
3319 Debug Version: 165.1K Code, 51.9K Data, 217.0K Total

```

```

3321 2) iASL Compiler/Disassembler and Tools:

```

```

3323 iASL/Disassembler: Added a new option (-da, "disassemble all") to load
3324 the
3325 iASL/Disassembler: Added a new option (-da, "disassemble all") to load the
3326 namespace from and disassemble an entire group of AML files. Useful for
3327 loading all of the AML tables for a given machine (DSDT, SSDT1...SSDTn)
3328 and
3329 605 loading all of the AML tables for a given machine (DSDT, SSDT1...SSDTn) and

```

```

3328 disassembling with one simple command. ACPICA BZ 865. Lin Ming.

```

```

3330 iASL: Allow multiple invocations of -e option. This change allows
3331 multiple
3332 uses of -e on the command line: "-e ssdt1.dat -e ssdt2.dat". ACPICA BZ
3333 834.
3334 608 iASL: Allow multiple invocations of -e option. This change allows multiple
3335 609 uses of -e on the command line: "-e ssdt1.dat -e ssdt2.dat". ACPICA BZ 834.
3336 Lin Ming.

```

```

3336 -----
3337 02 July 2010. Summary of changes for version 20100702:

```

```

3339 1) ACPI CA Core Subsystem:

```

```

3341 Implemented several updates to the recently added GPE reference count
3342 support. The model for "wake" GPEs is changing to give the host OS
3343 complete
3344 control of these GPEs. Eventually, the ACPICA core will not execute any
3345 _PRW
3346 methods, since the host already must execute them. Also, additional
3347 changes
3348 618 support. The model for "wake" GPEs is changing to give the host OS complete
3349 619 control of these GPEs. Eventually, the ACPICA core will not execute any _PRW
3350 620 methods, since the host already must execute them. Also, additional changes
3351 were made to help ensure that the reference counts are kept in proper
3352 synchronization with reality. Rafael J. Wysocki.

```

```

3351 1) Ensure that GPEs are not enabled twice during initialization.
3352 2) Ensure that GPE enable masks stay in sync with the reference count.
3353 3) Do not inadvertently enable GPEs when writing GPE registers.
3354 4) Remove the internal wake reference counter and add new AcpiGpeWakeUp
3355 interface. This interface will set or clear individual GPEs for wakeup.
3356 5) Remove GpeType argument from AcpiEnable and AcpiDisable. These
3357 interfaces
3358 629 5) Remove GpeType argument from AcpiEnable and AcpiDisable. These interfaces
3359 are now used for "runtime" GPEs only.

```

```

3360 Changed the behavior of the GPE install/remove handler interfaces. The
3361 GPE
3362 is
3363 no longer disabled during this process, as it was found to cause problems
3364 on
3365 632 Changed the behavior of the GPE install/remove handler interfaces. The GPE is
3366 633 no longer disabled during this process, as it was found to cause problems on
3367 some machines. Rafael J. Wysocki.

```

```

3367 Reverted a change introduced in version 20100528 to enable Embedded
3368 Controller multi-byte transfers. This change was found to cause problems
3369 with
3370 Controller multi-byte transfers. This change was found to cause problems with
3371 Index Fields and possibly Bank Fields. It will be reintroduced when these
3372 problems have been resolved.

```

```

3373 Fixed a problem with references to Alias objects within Package Objects.
3374 A
3375 641 Fixed a problem with references to Alias objects within Package Objects. A
3376 reference to an Alias within the definition of a Package was not always
3377 resolved properly. Aliases to objects like Processors, Thermal zones,
3378 etc.
3379 were resolved to the actual object instead of a reference to the object
3380 as
3381 643 resolved properly. Aliases to objects like Processors, Thermal zones, etc.
3382 644 were resolved to the actual object instead of a reference to the object as it
3383 should be. Package objects are only allowed to contain integer, string,

```

3382 buffer, package, and reference objects. Redhat bugzilla 608648.

3384 Example Code and Data Size: These are the sizes for the OS-independent  
 3385 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 3386 **debug version of the code includes the debug output trace mechanism and**  
 3387 **has a**  
 650 *debug version of the code includes the debug output trace mechanism and has a*  
 3388 much larger code and data size.

3390 Previous Release:  
 3391 Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total  
 3392 Debug Version: 164.1K Code, 51.5K Data, 215.6K Total  
 3393 Current Release:  
 3394 Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total  
 3395 Debug Version: 164.0K Code, 51.5K Data, 215.5K Total

3397 2) iASL Compiler/Disassembler and Tools:

3399 iASL: Implemented a new compiler subsystem to allow definition and  
 3400 **compilation of the non-AML ACPI tables such as FADT, MADT, SRAT, etc.**  
 3401 **These**  
 663 *compilation of the non-AML ACPI tables such as FADT, MADT, SRAT, etc. These*  
 3402 are called "ACPI Data Tables", and the new compiler is the "Data Table  
 3403 Compiler". This compiler is intended to simplify the existing error-prone  
 3404 process of creating these tables for the BIOS, as well as allowing the  
 3405 **disassembly, modification, recompilation, and override of existing ACPI**  
 3406 **data**  
 667 *disassembly, modification, recompilation, and override of existing ACPI data*  
 3407 tables. See the iASL User Guide for detailed information.

3409 iASL: Implemented a new Template Generator option in support of the new  
 3410 **Data**  
 670 *iASL: Implemented a new Template Generator option in support of the new Data*  
 3411 Table Compiler. This option will create examples of all known ACPI tables  
 3412 that can be used as the basis for table development. See the iASL  
 3413 documentation and the -T option.

3415 Disassembler and headers: Added support for the WDDT ACPI table (Watchdog  
 3416 Descriptor Table).

3418 Updated the Linux makefiles for iASL and AcpiExec to place the generated  
 3419 object files in the local directory so that there can be no collisions  
 3420 between the shared files between them that are generated with different  
 3421 options.

3423 **Added support for Mac OS X in the Unix OSL used for iASL and AcpiExec.**  
 3424 **Use**  
 683 *Added support for Mac OS X in the Unix OSL used for iASL and AcpiExec. Use*  
 3425 the #define \_\_APPLE\_\_ to enable this support.

3427 -----  
 3428 28 May 2010. Summary of changes for version 20100528:

3430 Note: The ACPI 4.0a specification was released on April 5, 2010 and is  
 3431 available at [www.acpi.info](http://www.acpi.info). This is primarily an errata release.

3433 1) ACPI CA Core Subsystem:

3435 **Undefined ACPI tables: We are looking for the definitions for the**  
 3436 **following**  
 694 *Undefined ACPI tables: We are looking for the definitions for the following*  
 3437 ACPI tables that have been seen in the field: ATKG, IEIT, GSCI.

3439 **Implemented support to enable multi-byte transfers for Embedded**  
 3440 **Controller**  
 3441 **(EC) operation regions. Previously, the maximum data size passed to the**

3442 **EC**  
 3443 **operation region handler was a single byte. There are often EC Fields**  
 3444 **larger**  
 3445 **than one byte that need to be transferred, and it is useful for the EC**  
 3446 **driver**  
 3447 **to lock these as a single transaction. This change enables single**  
 3448 **transfers**  
 3449 **larger than 8 bits. This effectively changes the access to the EC space**  
 3450 **from**  
 3451 **ByteAcc to AnyAcc, and will probably require changes to the host OS**  
 3452 **Embedded**  
 3453 **Controller driver to enable 16/32/64/256-bit transfers in addition to 8-**  
 3454 **bit**  
 697 *Implemented support to enable multi-byte transfers for Embedded Controller*  
 698 *(EC) operation regions. Previously, the maximum data size passed to the EC*  
 699 *operation region handler was a single byte. There are often EC Fields larger*  
 700 *than one byte that need to be transferred, and it is useful for the EC driver*  
 701 *to lock these as a single transaction. This change enables single transfers*  
 702 *larger than 8 bits. This effectively changes the access to the EC space from*  
 703 *ByteAcc to AnyAcc, and will probably require changes to the host OS Embedded*  
 704 *Controller driver to enable 16/32/64/256-bit transfers in addition to 8-bit*  
 3455 transfers. Alexey Starikovskiy, Lin Ming

3457 **Implemented a performance enhancement for namespace search and access.**  
 3458 **This**  
 3459 **change enhances the performance of namespace searches and walks by adding**  
 3460 **a**  
 3461 **backpointer to the parent in each namespace node. On large namespaces,**  
 3462 **this**  
 3463 **change can improve overall ACPI performance by up to 9X. Adding a pointer**  
 3464 **to**  
 3465 **each namespace node increases the overall size of the internal namespace**  
 3466 **by**  
 707 *Implemented a performance enhancement for namespace search and access. This*  
 708 *change enhances the performance of namespace searches and walks by adding a*  
 709 *backpointer to the parent in each namespace node. On large namespaces, this*  
 710 *change can improve overall ACPI performance by up to 9X. Adding a pointer to*  
 711 *each namespace node increases the overall size of the internal namespace by*  
 3467 *about 5%, since each namespace entry usually consists of both a namespace*  
 3468 *node and an ACPI operand object. However, this is the first growth of the*  
 3469 namespace in ten years. ACPICA bugzilla 817. Alexey Starikovskiy.

3471 **Implemented a performance optimization that reduces the number of**  
 3472 **namespace**  
 3473 **walks. On control method exit, only walk the namespace if the method is**  
 3474 **known**  
 3475 **to have created namespace objects outside of its local scope. Previously,**  
 3476 **the**  
 3477 **entire namespace was traversed on each control method exit. This change**  
 3478 **can**  
 3479 **improve overall ACPI performance by up to 3X. Alexey Starikovskiy, Bob**  
 3480 **Moore.**  
 716 *Implemented a performance optimization that reduces the number of namespace*  
 717 *walks. On control method exit, only walk the namespace if the method is known*  
 718 *to have created namespace objects outside of its local scope. Previously, the*  
 719 *entire namespace was traversed on each control method exit. This change can*  
 720 *improve overall ACPI performance by up to 3X. Alexey Starikovskiy, Bob Moore.*

3482 **Added support to truncate I/O addresses to 16 bits for Windows**  
 3483 **compatibility.**  
 722 *Added support to truncate I/O addresses to 16 bits for Windows compatibility.*  
 3484 Some ASL code has been seen in the field that inadvertently has bits set  
 3485 **above bit 15. This feature is optional and is enabled if the BIOS**  
 3486 **requests**  
 724 *above bit 15. This feature is optional and is enabled if the BIOS requests*  
 3487 any Windows OSI strings. It can also be enabled by the host OS. Matthew

3488 Garrett, Bob Moore.

3490 Added support to limit the maximum time for the ASL Sleep() operator. To  
3491 prevent accidental deep sleeps, limit the maximum time that Sleep() will  
3492 actually sleep. Configurable, the default maximum is two seconds. ACPICA  
3493 bugzilla 854.

3495 **Added run-time validation support for the \_WDG and \_WED Microsoft**  
3496 **predefined**  
3497 **methods. These objects are defined by "Windows Instrumentation", and are**  
3498 **not**  
733 *Added run-time validation support for the \_WDG and \_WED Microsoft predefined*  
734 *methods. These objects are defined by "Windows Instrumentation", and are not*  
3499 *part of the ACPI spec. ACPICA BZ 860.*

3501 Expanded all statistic counters used during namespace and device  
3502 **initialization from 16 to 32 bits in order to support very large**  
3503 **namespaces.**  
738 *initialization from 16 to 32 bits in order to support very large namespaces.*

3505 **Replaced all instances of %d in printf format specifiers with %u since**  
3506 **nearly**  
740 *Replaced all instances of %d in printf format specifiers with %u since nearly*  
3507 *all integers in ACPICA are unsigned.*

3509 **Fixed the exception namestring for AE\_WAKE\_ONLY\_GPE. Was incorrectly**  
3510 **returned**  
743 *Fixed the exception namestring for AE\_WAKE\_ONLY\_GPE. Was incorrectly returned*  
3511 *as AE\_NO\_HANDLER.*

3513 Example Code and Data Size: These are the sizes for the OS-independent  
3514 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3515 **debug version of the code includes the debug output trace mechanism and**  
3516 **has a**  
748 *debug version of the code includes the debug output trace mechanism and has a*  
3517 *much larger code and data size.*

3519	Previous Release:
3520	Non-Debug Version: 88.4K Code, 18.8K Data, 107.2K Total
3521	Debug Version: 164.2K Code, 51.5K Data, 215.7K Total
3522	Current Release:
3523	Non-Debug Version: 88.3K Code, 18.8K Data, 107.1K Total
3524	Debug Version: 164.1K Code, 51.5K Data, 215.6K Total

3526 2) iASL Compiler/Disassembler and Tools:

3528 iASL: Added compiler support for the \_WDG and \_WED Microsoft predefined  
3529 **methods. These objects are defined by "Windows Instrumentation", and are**  
3530 **not**  
761 *methods. These objects are defined by "Windows Instrumentation", and are not*  
3531 *part of the ACPI spec. ACPICA BZ 860.*

3533 AcpiExec: added option to disable the memory tracking mechanism. The -dt  
3534 option will disable the tracking mechanism, which improves performance  
3535 considerably.

3537 AcpiExec: Restructured the command line options into -d (disable) and -e  
3538 (enable) options.

3540 -----  
3541 28 April 2010. Summary of changes for version 20100428:

3543 1) ACPI CA Core Subsystem:

3545 Implemented GPE support for dynamically loaded ACPI tables. For all GPEs,  
3546 **including FADT-based and GPE Block Devices, execute any \_PRW methods in**

3547 **the**  
777 *including FADT-based and GPE Block Devices, execute any \_PRW methods in the*  
3548 *new table, and process any \_Lxx/\_Exxx GPE methods in the new table. Any*  
3549 *runtime GPE that is referenced by an \_Lxx/\_Exxx method in the new table is*  
3550 *immediately enabled. Handles the FADT-defined GPEs as well as GPE Block*  
3551 *Devices. Provides compatibility with other ACPI implementations. Two new*  
3552 **files added, evgpeinit.c and evgpeutil.c. ACPICA BZ 833. Lin Ming, Bob**  
3553 **Moore.**  
782 *files added, evgpeinit.c and evgpeutil.c. ACPICA BZ 833. Lin Ming, Bob Moore.*

3555 **Fixed a regression introduced in version 20100331 within the table**  
3556 **manager**  
3557 **where initial table loading could fail. This was introduced in the fix**  
3558 **for**  
3559 **AcpiReallocateRootTable. Also, renamed some of fields in the table**  
3560 **manager**  
784 *Fixed a regression introduced in version 20100331 within the table manager*  
785 *where initial table loading could fail. This was introduced in the fix for*  
786 *AcpiReallocateRootTable. Also, renamed some of fields in the table manager*  
3561 *data structures to clarify their meaning and use.*

3563 Fixed a possible allocation overrun during internal object copy in  
3564 **AcpiUtCopySimpleObject. The original code did not correctly handle the**  
3565 **case**  
3566 **where the object to be copied was a namespace node. Lin Ming. ACPICA BZ**  
3567 **847.**  
790 *AcpiUtCopySimpleObject. The original code did not correctly handle the case*  
791 *where the object to be copied was a namespace node. Lin Ming. ACPICA BZ 847.*

3569 Updated the allocation dump routine, AcpiUtDumpAllocation and fixed a  
3570 **possible access beyond end-of-allocation. Also, now fully validate**  
3571 **descriptor**  
794 *possible access beyond end-of-allocation. Also, now fully validate descriptor*  
3572 *(size and type) before output. Lin Ming, Bob Moore. ACPICA BZ 847*

3574 Example Code and Data Size: These are the sizes for the OS-independent  
3575 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3576 **debug version of the code includes the debug output trace mechanism and**  
3577 **has a**  
799 *debug version of the code includes the debug output trace mechanism and has a*  
3578 *much larger code and data size.*

3580	Previous Release:
3581	Non-Debug Version: 87.9K Code, 18.6K Data, 106.5K Total
3582	Debug Version: 163.5K Code, 51.3K Data, 214.8K Total
3583	Current Release:
3584	Non-Debug Version: 88.4K Code, 18.8K Data, 107.2K Total
3585	Debug Version: 164.2K Code, 51.5K Data, 215.7K Total

3587 2) iASL Compiler/Disassembler and Tools:

3589 iASL: Implemented Min/Max/Len/Gran validation for address resource  
3590 **descriptors. This change implements validation for the address fields**  
3591 **that**  
812 *descriptors. This change implements validation for the address fields that*  
3592 *are common to all address-type resource descriptors. These checks are*  
3593 *implemented: Checks for valid Min/Max, length within the Min/Max window,*  
3594 **valid granularity, Min/Max a multiple of granularity, and \_MIF/\_MAF as**  
3595 **per**  
3596 **table 6-40 in the ACPI 4.0a specification. Also split the large**  
3597 **aslstypel.c**  
815 *valid granularity, Min/Max a multiple of granularity, and \_MIF/\_MAF as per*  
816 *table 6-40 in the ACPI 4.0a specification. Also split the large aslstypel.c*  
3598 *and aslstype2.c files into five new files. ACPICA BZ 840.*

3600 iASL: Added support for the \_Wxxx predefined names. This support was

3601 **missing**  
 819 *iASL: Added support for the \_Wxx predefined names. This support was missing*  
 3602 and these names were not recognized by the compiler as valid predefined  
 3603 names. ACPICA BZ 851.

3605 **iASL: Added an error for all predefined names that are defined to return**  
 3606 **no**  
 3607 **value and thus must be implemented as Control Methods. These include all**  
 3608 **of**  
 823 *iASL: Added an error for all predefined names that are defined to return no*  
 824 *value and thus must be implemented as Control Methods. These include all of*  
 3609 *the \_Lxx, \_Exx, \_Wxx, and \_Qxx names, as well as some other miscellaneous*  
 3610 *names such as \_DIS, \_INI, \_IRC, \_OFF, \_ON, and \_PSx. ACPICA BZ 850, 856.*

3612 **iASL: Implemented the -ts option to emit hex AML data in ASL format, as**  
 3613 **an**  
 3614 **ASL Buffer. Allows ACPI tables to be easily included within ASL files, to**  
 3615 **be**  
 3616 **dynamically loaded via the Load() operator. Also cleaned up output for**  
 3617 **the**  
 3618 **-**  
 828 *iASL: Implemented the -ts option to emit hex AML data in ASL format, as an*  
 829 *ASL Buffer. Allows ACPI tables to be easily included within ASL files, to be*  
 830 *dynamically loaded via the Load() operator. Also cleaned up output for the -*  
 3619 *ta and -tc options. ACPICA BZ 853.*

3621 **Tests: Added a new file with examples of extended iASL error checking.**  
 3622 **Demonstrates the advanced error checking ability of the iASL compiler.**  
 3623 **Available at tests/misc/badcode.asl.**

3625 -----  
 3626 31 March 2010. Summary of changes for version 20100331:

3628 1) ACPI CA Core Subsystem:

3630 **Completed a major update for the GPE support in order to improve support**  
 3631 **for**  
 3632 **shared GPEs and to simplify both host OS and ACPICA code. Added a**  
 3633 **reference**  
 3634 **count mechanism to support shared GPEs that require multiple device**  
 3635 **drivers.**  
 842 *Completed a major update for the GPE support in order to improve support for*  
 843 *shared GPEs and to simplify both host OS and ACPICA code. Added a reference*  
 844 *count mechanism to support shared GPEs that require multiple device drivers.*  
 3636 *Several external interfaces have changed. One external interface has been*  
 3637 *removed. One new external interface was added. Most of the GPE external*  
 3638 *interfaces now use the GPE spinlock instead of the events mutex (and the*  
 3639 *Flags parameter for many GPE interfaces has been removed.) See the*  
 3640 *updated*  
 3641 *ACPICA Programmer Reference for details. Matthew Garrett, Bob Moore,*  
 3642 *Rafael*  
 848 *Flags parameter for many GPE interfaces has been removed.) See the updated*  
 849 *ACPICA Programmer Reference for details. Matthew Garrett, Bob Moore, Rafael*  
 3643 *Wysocki. ACPICA BZ 831.*

3645 **Changed:**  
 3646 **AcpiEnableGpe, AcpiDisableGpe, AcpiClearGpe, AcpiGetGpeStatus**  
 3647 **Removed:**  
 3648 **AcpiSetGpeType**  
 3649 **New:**  
 3650 **AcpiSetGpe**

3652 **Implemented write support for DataTable operation regions. These regions**  
 3653 **are**  
 3654 **defined via the DataTableRegion() operator. Previously, only read support**  
 3655 **was**

3656 **implemented. The ACPI specification allows DataTableRegions to be**  
 3657 **read/write,**  
 859 *Implemented write support for DataTable operation regions. These regions are*  
 860 *defined via the DataTableRegion() operator. Previously, only read support was*  
 861 *implemented. The ACPI specification allows DataTableRegions to be read/write,*  
 3658 *however.*

3660 **Implemented a new subsystem option to force a copy of the DSDT to local**  
 3661 **memory. Optionally copy the entire DSDT to local memory (instead of**  
 3662 **simply**  
 3663 **mapping it.) There are some (albeit very rare) BIOSs that corrupt or**  
 3664 **replace**  
 3665 **the original DSDT, creating the need for this option. Default is FALSE,**  
 3666 **do**  
 865 *memory. Optionally copy the entire DSDT to local memory (instead of simply*  
 866 *mapping it.) There are some (albeit very rare) BIOSs that corrupt or replace*  
 867 *the original DSDT, creating the need for this option. Default is FALSE, do*  
 3667 *not copy the DSDT.*

3669 **Implemented detection of a corrupted or replaced DSDT. This change adds**  
 3670 **support to detect a DSDT that has been corrupted and/or replaced from**  
 3671 **outside**  
 3672 **the OS (by firmware). This is typically catastrophic for the system, but**  
 3673 **has**  
 871 *support to detect a DSDT that has been corrupted and/or replaced from outside*  
 872 *the OS (by firmware). This is typically catastrophic for the system, but has*  
 3674 *been seen on some machines. Once this problem has been detected, the DSDT*  
 3675 *copy option can be enabled via system configuration. Lin Ming, Bob Moore.*

3677 **Fixed two problems with AcpiReallocateRootTable during the root table**  
 3678 **copy.**  
 876 *Fixed two problems with AcpiReallocateRootTable during the root table copy.*  
 3679 *When copying the root table to the new allocation, the length used was*  
 3680 *incorrect. The new size was used instead of the current table size,*  
 3681 *meaning*  
 3682 *too much data was copied. Also, the count of available slots for ACPI*  
 3683 *tables*  
 878 *incorrect. The new size was used instead of the current table size, meaning*  
 879 *too much data was copied. Also, the count of available slots for ACPI tables*  
 3684 *was not set correctly. Alexey Starikovskiy, Bob Moore.*

3686 **Example Code and Data Size: These are the sizes for the OS-independent**  
 3687 **apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The**  
 3688 **debug version of the code includes the debug output trace mechanism and**  
 3689 **has a**  
 884 *debug version of the code includes the debug output trace mechanism and has a*  
 3690 *much larger code and data size.*

3692 **Previous Release:**  
 3693 **Non-Debug Version: 87.5K Code, 18.4K Data, 105.9K Total**  
 3694 **Debug Version: 163.4K Code, 51.1K Data, 214.5K Total**  
 3695 **Current Release:**  
 3696 **Non-Debug Version: 87.9K Code, 18.6K Data, 106.5K Total**  
 3697 **Debug Version: 163.5K Code, 51.3K Data, 214.8K Total**

3699 2) iASL Compiler/Disassembler and Tools:

3701 **iASL: Implement limited typechecking for values returned from predefined**  
 3702 **control methods. The type of any returned static (unnamed) object is now**  
 3703 **validated. For example, Return(1). ACPICA BZ 786.**

3705 **iASL: Fixed a predefined name object verification regression. Fixes a**  
 3706 **problem**  
 900 *iASL: Fixed a predefined name object verification regression. Fixes a problem*  
 3707 *introduced in version 20100304. An error is incorrectly generated if a*  
 3708 *predefined name is declared as a static named object with a value defined*

3709 using the keywords "Zero", "One", or "Ones". Lin Ming.

3711 **iASL: Added Windows 7 support for the -g option (get local ACPI tables)**  
 3712 **by**  
 905 *iASL: Added Windows 7 support for the -g option (get local ACPI tables) by*  
 3713 *reducing the requested registry access rights. ACPICA BZ 842.*

3715 **Disassembler: fixed a possible fault when generating External()**  
 3716 **statements.**  
 3717 **Introduced in commit ae7d6fd: Properly handle externals with parent-**  
 3718 **prefix**  
 908 *Disassembler: fixed a possible fault when generating External() statements.*  
 909 *Introduced in commit ae7d6fd: Properly handle externals with parent-prefix*  
 3719 *(carat). Fixes a string length allocation calculation. Lin Ming.*

3721 -----  
 3722 04 March 2010. Summary of changes for version 20100304:

3724 1) ACPI CA Core Subsystem:

3726 Fixed a possible problem with the AML Mutex handling function  
 3727 AcpiExReleaseMutex where the function could fault under the very rare  
 3728 **condition when the interpreter has blocked, the interpreter lock is**  
 3729 **released,**  
 919 *condition when the interpreter has blocked, the interpreter lock is released,*  
 3730 *the interpreter is then reentered via the same thread, and attempts to*  
 3731 **acquire an AML mutex that was previously acquired. FreeBSD report 140979.**  
 3732 **Lin**  
 921 *acquire an AML mutex that was previously acquired. FreeBSD report 140979. Lin*  
 3733 *Ming.*

3735 Implemented additional configuration support for the AML "Debug Object".  
 3736 Output from the debug object can now be enabled via a global variable,  
 3737 **AcpiGbl\_EnableAmlDebugObject. This will assist with remote machine**  
 3738 **debugging.**  
 3739 **This debug output is now available in the release version of ACPICA**  
 3740 **instead**  
 3741 **of just the debug version. Also, the entire debug output module can now**  
 3742 **be**  
 926 *AcpiGbl\_EnableAmlDebugObject. This will assist with remote machine debugging.*  
 927 *This debug output is now available in the release version of ACPICA instead*  
 928 *of just the debug version. Also, the entire debug output module can now be*  
 3743 *configured out of the ACPICA build if desired. One new file added,*  
 3744 *executer/exdebug.c. Lin Ming, Bob Moore.*

3746 Added header support for the ACPI MCHI table (Management Controller Host  
 3747 **Interface Table). This table was added in ACPI 4.0, but the defining**  
 3748 **document**  
 933 *Interface Table). This table was added in ACPI 4.0, but the defining document*  
 3749 *has only recently become available.*

3751 **Standardized output of integer values for ACPICA warnings/errors. Always**  
 3752 **use**  
 3753 **0x prefix for hex output, always use %u for unsigned integer decimal**  
 3754 **output.**  
 3755 **Affects ACPI\_INFO, ACPI\_ERROR, ACPI\_EXCEPTION, and ACPI\_WARNING (about**  
 3756 **400**  
 936 *Standardized output of integer values for ACPICA warnings/errors. Always use*  
 937 *0x prefix for hex output, always use %u for unsigned integer decimal output.*  
 938 *Affects ACPI\_INFO, ACPI\_ERROR, ACPI\_EXCEPTION, and ACPI\_WARNING (about 400*  
 3757 *invocations.) These invocations were converted from the original*  
 3758 *ACPI\_DEBUG\_PRINT invocations and were not consistent. ACPICA BZ 835.*

3760 Example Code and Data Size: These are the sizes for the OS-independent  
 3761 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 3762 **debug version of the code includes the debug output trace mechanism and**

3763 **has a**  
 944 *debug version of the code includes the debug output trace mechanism and has a*  
 3764 *much larger code and data size.*

3766 Previous Release:  
 3767 Non-Debug Version: 87.1K Code, 18.0K Data, 105.1K Total  
 3768 Debug Version: 163.5K Code, 50.9K Data, 214.4K Total  
 3769 Current Release:  
 3770 Non-Debug Version: 87.5K Code, 18.4K Data, 105.9K Total  
 3771 Debug Version: 163.4K Code, 51.1K Data, 214.5K Total

3773 2) iASL Compiler/Disassembler and Tools:

3775 iASL: Implemented typechecking support for static (non-control method)  
 3776 predefined named objects that are declared with the Name() operator. For  
 3777 example, the type of this object is now validated to be of type Integer:  
 3778 **Name(\_BBN, 1). This change migrates the compiler to using the core**  
 3779 **predefined**  
 959 *Name(\_BBN, 1). This change migrates the compiler to using the core predefined*  
 3780 *name table instead of maintaining a local version. Added a new file,*  
 3781 *aslpredef.c. ACPICA BZ 832.*

3783 Disassembler: Added support for the ACPI 4.0 MCHI table.

3785 -----  
 3786 21 January 2010. Summary of changes for version 20100121:

3788 1) ACPI CA Core Subsystem:

3790 Added the 2010 copyright to all module headers and signons. This affects  
 3791 virtually every file in the ACPICA core subsystem, the iASL compiler, the  
 3792 tools/utilities, and the test suites.

3794 **Implemented a change to the AcpiGetDevices interface to eliminate**  
 3795 **unnecessary**  
 974 *Implemented a change to the AcpiGetDevices interface to eliminate unnecessary*  
 3796 *invocations of the \_STA method. In the case where a specific \_HID is*  
 3797 *requested, do not run \_STA until a \_HID match is found. This eliminates*  
 3798 **potentially dozens of \_STA calls during a search for a particular**  
 3799 **device/HID,**  
 977 *potentially dozens of \_STA calls during a search for a particular device/HID,*  
 3800 *which in turn can improve boot times. ACPICA BZ 828. Lin Ming.*

3802 **Implemented an additional repair for predefined method return values.**  
 3803 **Attempt**  
 3804 **to repair unexpected NULL elements within returned Package objects.**  
 3805 **Create**  
 3806 **an**  
 3807 **Integer of value zero, a NULL String, or a zero-length Buffer as**  
 3808 **appropriate.**  
 980 *Implemented an additional repair for predefined method return values. Attempt*  
 981 *to repair unexpected NULL elements within returned Package objects. Create an*  
 982 *Integer of value zero, a NULL String, or a zero-length Buffer as appropriate.*  
 3809 *ACPICA BZ 818. Lin Ming, Bob Moore.*

3811 **Removed the obsolete ACPI\_INTEGER data type. This type was introduced as**  
 3812 **the**  
 3813 **code was migrated from ACPI 1.0 (with 32-bit AML integers) to ACPI 2.0**  
 3814 **(with**  
 3815 **64-bit AML integers). It is now obsolete and this change removes it from**  
 3816 **the**  
 3817 **ACPICA code base, replaced by UINT64. The original typedef has been**  
 3818 **retained**  
 3819 **for now for compatibility with existing device driver code. ACPICA BZ**  
 3820 **824.**  
 985 *Removed the obsolete ACPI\_INTEGER data type. This type was introduced as the*

986 code was migrated from ACPI 1.0 (with 32-bit AML integers) to ACPI 2.0 (with  
987 64-bit AML integers). It is now obsolete and this change removes it from the  
988 ACPICA code base, replaced by UINT64. The original typedef has been retained  
989 for now for compatibility with existing device driver code. ACPICA BZ 824.

3822 Removed the unused UINT32\_STRUCT type, and the obsolete Integer64 field  
3823 in  
991 Removed the unused UINT32\_STRUCT type, and the obsolete Integer64 field in  
3824 the parse tree object.

3826 Added additional warning options for the gcc-4 generation. Updated the  
3827 source  
3828 accordingly. This includes some code restructuring to eliminate  
3829 unreachable  
3830 code, elimination of some gotos, elimination of unused return values,  
3831 some  
994 Added additional warning options for the gcc-4 generation. Updated the source  
995 accordingly. This includes some code restructuring to eliminate unreachable  
996 code, elimination of some gotos, elimination of unused return values, some  
3832 additional casting, and removal of redundant declarations.

3834 Example Code and Data Size: These are the sizes for the OS-independent  
3835 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3836 debug version of the code includes the debug output trace mechanism and  
3837 has a  
1001 debug version of the code includes the debug output trace mechanism and has a  
3838 much larger code and data size.

3840 Previous Release:  
3841 Non-Debug Version: 87.0K Code, 18.0K Data, 105.0K Total  
3842 Debug Version: 163.4K Code, 50.8K Data, 214.2K Total  
3843 Current Release:  
3844 Non-Debug Version: 87.1K Code, 18.0K Data, 105.1K Total  
3845 Debug Version: 163.5K Code, 50.9K Data, 214.4K Total

3847 2) iASL Compiler/Disassembler and Tools:

3849 No functional changes for this release.

3851 -----  
3852 14 December 2009. Summary of changes for version 20091214:

3854 1) ACPI CA Core Subsystem:

3856 Enhanced automatic data type conversions for predefined name repairs.  
3857 This  
3858 change expands the automatic repairs/conversions for predefined name  
3859 return  
3860 values to make Integers, Strings, and Buffers fully interchangeable.  
3861 Also,  
3862 a  
3863 Buffer can be converted to a Package of Integers if necessary. The  
3864 nsrepair.c  
1020 Enhanced automatic data type conversions for predefined name repairs. This  
1021 change expands the automatic repairs/conversions for predefined name return  
1022 values to make Integers, Strings, and Buffers fully interchangeable. Also, a  
1023 Buffer can be converted to a Package of Integers if necessary. The nsrepair.c  
3865 module was completely restructured. Lin Ming, Bob Moore.

3867 Implemented automatic removal of null package elements during predefined  
3868 name  
1026 Implemented automatic removal of null package elements during predefined name  
3869 repairs. This change will automatically remove embedded and trailing NULL  
3870 package elements from returned package objects that are defined to  
3871 contain  
3872 a

3873 variable number of sub-packages. The driver is then presented with a  
3874 package  
1028 package elements from returned package objects that are defined to contain a  
1029 variable number of sub-packages. The driver is then presented with a package  
3875 with no null elements to deal with. ACPICA BZ 819.

3877 Implemented a repair for the predefined \_FDE and \_GTM names. The expected  
3878 return value for both names is a Buffer of 5 DWORDs. This repair fixes  
3879 two  
3880 possible problems (both seen in the field), where a package of integers  
3881 is  
3882 returned, or a buffer of BYTES is returned. With assistance from Jung-uk  
3883 Kim.  
1033 return value for both names is a Buffer of 5 DWORDs. This repair fixes two  
1034 possible problems (both seen in the field), where a package of integers is  
1035 returned, or a buffer of BYTES is returned. With assistance from Jung-uk Kim.

3885 Implemented additional module-level code support. This change will  
3886 properly  
3887 execute module-level code that is not at the root of the namespace (under  
3888 a  
3889 Device object, etc.). Now executes the code within the current scope  
3890 instead  
1037 Implemented additional module-level code support. This change will properly  
1038 execute module-level code that is not at the root of the namespace (under a  
1039 Device object, etc.). Now executes the code within the current scope instead  
3891 of the root. ACPICA BZ 762. Lin Ming.

3893 Fixed possible mutex acquisition errors when running \_REG methods. Fixes  
3894 a  
3895 problem where mutex errors can occur when running a \_REG method that is  
3896 in  
3897 the same scope as a method-defined operation region or an operation  
3898 region  
3899 under a module-level IF block. This type of code is rare, so the problem  
3900 has  
1042 Fixed possible mutex acquisition errors when running \_REG methods. Fixes a  
1043 problem where mutex errors can occur when running a \_REG method that is in  
1044 the same scope as a method-defined operation region or an operation region  
1045 under a module-level IF block. This type of code is rare, so the problem has  
3901 not been seen before. ACPICA BZ 826. Lin Ming, Bob Moore.

3903 Fixed a possible memory leak during module-level code execution. An  
3904 object  
1048 Fixed a possible memory leak during module-level code execution. An object  
3905 could be leaked for each block of executed module-level code if the  
3906 interpreter slack mode is enabled This change deletes any implicitly  
3907 returned  
1050 interpreter slack mode is enabled This change deletes any implicitly returned  
3908 object from the module-level code block. Lin Ming.

3910 Removed messages for successful predefined repair(s). The repair  
3911 mechanism  
3912 was considered too wordy. Now, messages are only unconditionally emitted  
3913 if  
1053 Removed messages for successful predefined repair(s). The repair mechanism  
1054 was considered too wordy. Now, messages are only unconditionally emitted if  
3914 the return object cannot be repaired. Existing messages for successful  
3915 repairs were converted to ACPI\_DEBUG\_PRINT messages for now. ACPICA BZ  
3916 827.  
1056 repairs were converted to ACPI\_DEBUG\_PRINT messages for now. ACPICA BZ 827.

3918 Example Code and Data Size: These are the sizes for the OS-independent  
3919 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
3920 debug version of the code includes the debug output trace mechanism and  
3921 has a

1060 *debug version of the code includes the debug output trace mechanism and has a*  
 3922 *much larger code and data size.*

3924 Previous Release:  
 3925 Non-Debug Version: 86.6K Code, 18.2K Data, 104.8K Total  
 3926 Debug Version: 162.7K Code, 50.8K Data, 213.5K Total  
 3927 Current Release:  
 3928 Non-Debug Version: 87.0K Code, 18.0K Data, 105.0K Total  
 3929 Debug Version: 163.4K Code, 50.8K Data, 214.2K Total

3931 2) iASL Compiler/Disassembler and Tools:

3933 **iASL: Fixed a regression introduced in 20091112 where intermediate .SRC**  
 3934 **files**  
 1072 *iASL: Fixed a regression introduced in 20091112 where intermediate .SRC files*  
 3935 *were no longer automatically removed at the termination of the compile.*

3937 acpiexec: Implemented the -f option to specify default region fill value.  
 3938 This option specifies the value used to initialize buffers that simulate  
 3939 **operation regions. Default value is zero. Useful for debugging problems**  
 3940 **that**  
 1077 *operation regions. Default value is zero. Useful for debugging problems that*  
 3941 *depend on a specific initial value for a region or field.*

3943 -----  
 3944 12 November 2009. Summary of changes for version 20091112:

3946 1) ACPI CA Core Subsystem:

3948 Implemented a post-order callback to AcpiWalkNamespace. The existing  
 3949 interface only has a pre-order callback. This change adds an additional  
 3950 **parameter for a post-order callback which will be more useful for bus**  
 3951 **scans.**  
 1087 *parameter for a post-order callback which will be more useful for bus scans.*  
 3952 ACPICA BZ 779. Lin Ming. Updated the ACPICA Programmer Reference.

3954 Modified the behavior of the operation region memory mapping cache for  
 3955 **SystemMemory. Ensure that the memory mappings created for operation**  
 3956 **regions**  
 1091 *SystemMemory. Ensure that the memory mappings created for operation regions*  
 3957 *do not cross 4K page boundaries. Crossing a page boundary while mapping*  
 3958 **regions can cause kernel warnings on some hosts if the pages have**  
 3959 **different**  
 3960 **attributes. Such regions are probably BIOS bugs, and this is the**  
 3961 **workaround.**  
 1093 *regions can cause kernel warnings on some hosts if the pages have different*  
 1094 *attributes. Such regions are probably BIOS bugs, and this is the workaround.*  
 3962 Linux BZ 14445. Lin Ming.

3964 Implemented an automatic repair for predefined methods that must return  
 3965 **sorted lists. This change will repair (by sorting) packages returned by**  
 3966 **\_ALR,**  
 3967 **\_PSS, and \_TSS. Drivers can now assume that the packages are correctly**  
 3968 **sorted**  
 1098 *sorted lists. This change will repair (by sorting) packages returned by \_ALR,*  
 1099 *\_PSS, and \_TSS. Drivers can now assume that the packages are correctly sorted*  
 3969 *and do not contain NULL package elements. Adds one new file,*  
 3970 *namespace/nsrepair2.c. ACPICA BZ 784. Lin Ming, Bob Moore.*

3972 **Fixed a possible fault during predefined name validation if a return**  
 3973 **Package**  
 1103 *Fixed a possible fault during predefined name validation if a return Package*  
 3974 *object contains NULL elements. Also adds a warning if a NULL element is*  
 3975 **followed by any non-null elements. ACPICA BZ 813, 814. Future enhancement**  
 3976 **may**  
 1105 *followed by any non-null elements. ACPICA BZ 813, 814. Future enhancement may*

3977 include repair or removal of all such NULL elements where possible.

3979 **Implemented additional module-level executable AML code support. This**  
 3980 **change**  
 1108 *Implemented additional module-level executable AML code support. This change*  
 3981 *will execute module-level code that is not at the root of the namespace*  
 3982 **(under a Device object, etc.) at table load time. Module-level executable**  
 3983 **AML**  
 1110 *(under a Device object, etc.) at table load time. Module-level executable AML*  
 3984 *code has been illegal since ACPI 2.0. ACPICA BZ 762. Lin Ming.*

3986 **Implemented a new internal function to create Integer objects. This**  
 3987 **function**  
 1113 *Implemented a new internal function to create Integer objects. This function*  
 3988 *simplifies miscellaneous object creation code. ACPICA BZ 823.*

3990 **Reduced the severity of predefined repair messages, Warning to Info.**  
 3991 **Since**  
 3992 **the object was successfully repaired, a warning is too severe. Reduced to**  
 3993 **an**  
 3994 **info message for now. These messages may eventually be changed to debug-**  
 3995 **only.**  
 1116 *Reduced the severity of predefined repair messages, Warning to Info. Since*  
 1117 *the object was successfully repaired, a warning is too severe. Reduced to an*  
 1118 *info message for now. These messages may eventually be changed to debug-only.*  
 3996 ACPICA BZ 812.

3998 Example Code and Data Size: These are the sizes for the OS-independent  
 3999 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4000 **debug version of the code includes the debug output trace mechanism and**  
 4001 **has a**  
 1123 *debug version of the code includes the debug output trace mechanism and has a*  
 4002 *much larger code and data size.*

4004 Previous Release:  
 4005 Non-Debug Version: 85.8K Code, 18.0K Data, 103.8K Total  
 4006 Debug Version: 161.8K Code, 50.6K Data, 212.4K Total  
 4007 Current Release:  
 4008 Non-Debug Version: 86.6K Code, 18.2K Data, 104.8K Total  
 4009 Debug Version: 162.7K Code, 50.8K Data, 213.5K Total

4011 2) iASL Compiler/Disassembler and Tools:

4013 **iASL: Implemented Switch() with While(1) so that Break works correctly.**  
 4014 **This**  
 4015 **change correctly implements the Switch operator with a surrounding**  
 4016 **While(1)**  
 1135 *iASL: Implemented Switch() with While(1) so that Break works correctly. This*  
 1136 *change correctly implements the Switch operator with a surrounding While(1)*  
 4017 *so that the Break operator works as expected. ACPICA BZ 461. Lin Ming.*

4019 **iASL: Added a message if a package initializer list is shorter than**  
 4020 **package**  
 4021 **length. Adds a new remark for a Package() declaration if an initializer**  
 4022 **list**  
 1139 *iASL: Added a message if a package initializer list is shorter than package*  
 1140 *length. Adds a new remark for a Package() declaration if an initializer list*  
 4023 *exists, but is shorter than the declared length of the package. Although*  
 4024 *technically legal, this is probably a coding error and it is seen in the*  
 4025 *field. ACPICA BZ 815. Lin Ming, Bob Moore.*

4027 **iASL: Fixed a problem where the compiler could fault after the maximum**  
 4028 **number**  
 1145 *iASL: Fixed a problem where the compiler could fault after the maximum number*  
 4029 *of errors was reached (200).*

4031 **acpixtract: Fixed a possible warning for pointer cast if the compiler**  
 4032 **warning**  
 1148 *acpixtract: Fixed a possible warning for pointer cast if the compiler warning*  
 4033 level set very high.

4035 -----  
 4036 13 October 2009. Summary of changes for version 20091013:

4038 1) ACPI CA Core Subsystem:

4040 **Fixed a problem where an Operation Region \_REG method could be executed**  
 4041 **more**  
 4042 **than once. If a custom address space handler is installed by the host**  
 4043 **before**  
 4044 **the "initialize operation regions" phase of the ACPICA initialization,**  
 4045 **any**  
 1156 *Fixed a problem where an Operation Region \_REG method could be executed more*  
 1157 *than once. If a custom address space handler is installed by the host before*  
 1158 *the "initialize operation regions" phase of the ACPICA initialization, any*  
 4046 *\_REG methods for that address space could be executed twice. This change*  
 4047 *fixes the problem. ACPICA BZ 427. Lin Ming.*

4049 Fixed a possible memory leak for the Scope() ASL operator. When the exact  
 4050 invocation of "Scope(\)" is executed (change scope to root), one internal  
 4051 operand object was leaked. Lin Ming.

4053 Implemented a run-time repair for the \_MAT predefined method. If the \_MAT  
 4054 return value is defined as a Field object in the AML, and the field  
 4055 **size is less than or equal to the default width of an integer (32 or**  
 4056 **64), \_MAT**  
 1168 *size is less than or equal to the default width of an integer (32 or 64), \_MAT*  
 4057 *can incorrectly return an Integer instead of a Buffer. ACPICA now*  
 4058 *automatically repairs this problem. ACPICA BZ 810.*

4060 **Implemented a run-time repair for the \_BIF and \_BIX predefined methods.**  
 4061 **The**  
 1172 *Implemented a run-time repair for the \_BIF and \_BIX predefined methods. The*  
 4062 *"OEM Information" field is often incorrectly returned as an Integer with*  
 4063 *value zero if the field is not supported by the platform. This is due to*  
 4064 *an*  
 1174 *value zero if the field is not supported by the platform. This is due to an*  
 4065 *ambiguity in the ACPI specification. The field should always be a string.*  
 4066 *ACPICA now automatically repairs this problem by returning a NULL string*  
 4067 *within the returned Package. ACPICA BZ 807.*

4069 Example Code and Data Size: These are the sizes for the OS-independent  
 4070 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4071 **debug version of the code includes the debug output trace mechanism and**  
 4072 **has a**  
 1181 *debug version of the code includes the debug output trace mechanism and has a*  
 4073 *much larger code and data size.*

4075 Previous Release:  
 4076 Non-Debug Version: 85.6K Code, 18.0K Data, 103.6K Total  
 4077 Debug Version: 161.7K Code, 50.9K Data, 212.6K Total  
 4078 Current Release:  
 4079 Non-Debug Version: 85.8K Code, 18.0K Data, 103.8K Total  
 4080 Debug Version: 161.8K Code, 50.6K Data, 212.4K Total

4082 2) iASL Compiler/Disassembler and Tools:

4084 Disassembler: Fixed a problem where references to external symbols that  
 4085 **contained one or more parent-prefixes (carats) were not handled**  
 4086 **correctly,**  
 1194 *contained one or more parent-prefixes (carats) were not handled correctly,*  
 4087 *possibly causing a fault. ACPICA BZ 806. Lin Ming.*

4089 Disassembler: Restructured the code so that all functions that handle  
 4090 external symbols are in a single module. One new file is added,  
 4091 common/dmextern.c.

4093 AML Debugger: Added a max count argument for the Batch command (which  
 4094 executes multiple predefined methods within the namespace.)

4096 iASL: Updated the compiler documentation (User Reference.) Available at  
 4097 <http://www.acpica.org/documentation/>. ACPICA BZ 750.

4099 AcpiXtract: Updated for Lint and other formatting changes. Close all open  
 4100 files.

4102 -----  
 4103 03 September 2009. Summary of changes for version 20090903:

4105 1) ACPI CA Core Subsystem:

4107 For Windows Vista compatibility, added the automatic execution of an \_INI  
 4108 method located at the namespace root (\\_INI). This method is executed at  
 4109 **table load time. This support is in addition to the automatic execution**  
 4110 **of**  
 1217 *table load time. This support is in addition to the automatic execution of*  
 4111 *\\_SB.\_INI. Lin Ming.*

4113 **Fixed a possible memory leak in the interpreter for AML package objects**  
 4114 **if**  
 4115 **the package initializer list is longer than the defined size of the**  
 4116 **package.**  
 4117 **This apparently can only happen if the BIOS changes the package size on**  
 4118 **the**  
 1220 *Fixed a possible memory leak in the interpreter for AML package objects if*  
 1221 *the package initializer list is longer than the defined size of the package.*  
 1222 *This apparently can only happen if the BIOS changes the package size on the*  
 4119 *fly (seen in a \_PSS object), as ASL compilers do not allow this. The*  
 4120 *interpreter will truncate the package to the defined size (and issue an*  
 4121 *error*  
 4122 *message), but previously could leave the extra objects undeleted if they*  
 4123 *were*  
 4124 *pre-created during the argument processing (such is the case if the*  
 4125 *package*  
 1224 *interpreter will truncate the package to the defined size (and issue an error*  
 1225 *message), but previously could leave the extra objects undeleted if they were*  
 1226 *pre-created during the argument processing (such is the case if the package*  
 4126 *consists of a number of sub-packages as in the \_PSS.) ACPICA BZ 805.*

4128 Fixed a problem seen when a Buffer or String is stored to itself via ASL.  
 4129 **This has been reported in the field. Previously, ACPICA would zero out**  
 4130 **the**  
 1230 *This has been reported in the field. Previously, ACPICA would zero out the*  
 4131 *buffer/string. Now, the operation is treated as a noop. Provides Windows*  
 4132 *compatibility. ACPICA BZ 803. Lin Ming.*

4134 Removed an extraneous error message for ASL constructs of the form  
 4135 **Store(LocalX,LocalX) when LocalX is uninitialized. These curious**  
 4136 **statements**  
 4137 **are seen in many BIOSs and are once again treated as NOOPs and no error**  
 4138 **is**  
 1235 *Store(LocalX,LocalX) when LocalX is uninitialized. These curious statements*  
 1236 *are seen in many BIOSs and are once again treated as NOOPs and no error is*  
 4139 *emitted when they are encountered. ACPICA BZ 785.*

4141 Fixed an extraneous warning message if a \_DSM reserved method returns a  
 4142 Package object. \_DSM can return any type of object, so validation on the  
 4143 return type cannot be performed. ACPICA BZ 802.

4145 Example Code and Data Size: These are the sizes for the OS-independent  
 4146 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4147 **debug version of the code includes the debug output trace mechanism and**  
 4148 **has a**  
 1245 *debug version of the code includes the debug output trace mechanism and has a*  
 4149 much larger code and data size.

4151 Previous Release:  
 4152 Non-Debug Version: 85.5K Code, 18.0K Data, 103.5K Total  
 4153 Debug Version: 161.6K Code, 50.9K Data, 212.5K Total  
 4154 Current Release:  
 4155 Non-Debug Version: 85.6K Code, 18.0K Data, 103.6K Total  
 4156 Debug Version: 161.7K Code, 50.9K Data, 212.6K Total

4158 2) iASL Compiler/Disassembler and Tools:

4160 iASL: Fixed a problem with the use of the Alias operator and Resource  
 4161 Templates. The correct alias is now constructed and no error is emitted.  
 4162 ACPICA BZ 738.

4164 **iASL: Implemented the -I option to specify additional search directories**  
 4165 **for**  
 1261 *iASL: Implemented the -I option to specify additional search directories for*  
 4166 include files. Allows multiple additional search paths for include files.  
 4167 **Directories are searched in the order specified on the command line**  
 4168 **(after**  
 1263 *Directories are searched in the order specified on the command line (after*  
 4169 the local directory is searched.) ACPICA BZ 800.

4171 iASL: Fixed a problem where the full pathname for include files was not  
 4172 emitted for warnings/errors. This caused the IDE support to not work  
 4173 properly. ACPICA BZ 765.

4175 iASL: Implemented the -@ option to specify a Windows-style response file  
 4176 containing additional command line options. ACPICA BZ 801.

4178 **AcpiExec: Added support to load multiple AML files simultaneously (such**  
 4179 **as**  
 4180 **a**  
 1273 *AcpiExec: Added support to load multiple AML files simultaneously (such as a*  
 4181 DSDT and multiple SSDTs). Also added support for wildcards within the AML  
 4182 pathname. These features allow all machine tables to be easily loaded and  
 4183 debugged together. ACPICA BZ 804.

4185 **Disassembler: Added missing support for disassembly of HEST table Error**  
 4186 **Bank**  
 1278 *Disassembler: Added missing support for disassembly of HEST table Error Bank*  
 4187 subtables.

4189 -----  
 4190 30 July 2009. Summary of changes for version 20090730:

4192 The ACPI 4.0 implementation for ACPICA is complete with this release.

4194 1) ACPI CA Core Subsystem:

4196 ACPI 4.0: Added header file support for all new and changed ACPI tables.  
 4197 **Completely new tables are: IBFT, IVRS, MSCT, and WAET. Tables that are**  
 4198 **new**  
 4199 **for ACPI 4.0, but have previously been supported in ACPICA are: CPEP,**  
 4200 **BERT,**  
 4201 **EINJ, ERST, and HEST. Other newly supported tables are: UEFI and WDAT.**  
 4202 **There**  
 1289 *Completely new tables are: IBFT, IVRS, MSCT, and WAET. Tables that are new*  
 1290 *for ACPI 4.0, but have previously been supported in ACPICA are: CPEP, BERT,*

1291 *EINJ, ERST, and HEST. Other newly supported tables are: UEFI and WDAT. There*  
 4203 *have been some ACPI 4.0 changes to other existing tables. Split the large*  
 4204 *actbl1.h header into the existing actbl2.h header. ACPICA BZ 774.*

4206 **ACPI 4.0: Implemented predefined name validation for all new names. There**  
 4207 **are**  
 4208 **31 new names in ACPI 4.0. The predefined validation module was split into**  
 4209 **two**  
 1295 *ACPI 4.0: Implemented predefined name validation for all new names. There are*  
 1296 *31 new names in ACPI 4.0. The predefined validation module was split into two*  
 4210 *files. The new file is namespace/nsrepair.c. ACPICA BZ 770.*

4212 Implemented support for so-called "module-level executable code". This is  
 4213 **executable AML code that exists outside of any control method and is**  
 4214 **intended**  
 4215 **to be executed at table load time. Although illegal since ACPI 2.0, this**  
 4216 **type**  
 4217 **of code still exists and is apparently still being created. Blocks of**  
 4218 **this**  
 4219 **code are now detected and executed as intended. Currently, the code**  
 4220 **blocks**  
 1300 *executable AML code that exists outside of any control method and is intended*  
 1301 *to be executed at table load time. Although illegal since ACPI 2.0, this type*  
 1302 *of code still exists and is apparently still being created. Blocks of this*  
 1303 *code are now detected and executed as intended. Currently, the code blocks*  
 4221 *must exist under either an If, Else, or While construct; these are the*  
 4222 *typical cases seen in the field. ACPICA BZ 762. Lin Ming.*

4224 Implemented an automatic dynamic repair for predefined names that return  
 4225 **nested Package objects. This applies to predefined names that are defined**  
 4226 **to**  
 1308 *nested Package objects. This applies to predefined names that are defined to*  
 4227 *return a variable-length Package of sub-packages. If the number of sub-*  
 4228 **packages is one, BIOS code is occasionally seen that creates a simple**  
 4229 **single**  
 1310 *packages is one, BIOS code is occasionally seen that creates a simple single*  
 4230 *package with no sub-packages. This code attempts to fix the problem by*  
 4231 **wrapping a new package object around the existing package. These methods**  
 4232 **can**  
 4233 **be repaired: \_ALR, \_CSD, \_HPX, \_MLS, \_PRT, \_PSS, \_TRT, and \_TSS. ACPICA**  
 4234 **BZ**  
 1312 *wrapping a new package object around the existing package. These methods can*  
 1313 *be repaired: \_ALR, \_CSD, \_HPX, \_MLS, \_PRT, \_PSS, \_TRT, and \_TSS. ACPICA BZ*  
 4235 *790.*

4237 **Fixed a regression introduced in 20090625 for the AcpiGetDevices**  
 4238 **interface.**  
 4239 **The \_HID/\_CID matching was broken and no longer matched IDs correctly.**  
 4240 **ACPICA**  
 1316 *Fixed a regression introduced in 20090625 for the AcpiGetDevices interface.*  
 1317 *The \_HID/\_CID matching was broken and no longer matched IDs correctly. ACPICA*  
 4241 *BZ 793.*

4243 Fixed a problem with AcpiReset where the reset would silently fail if the  
 4244 **register was one of the protected I/O ports. AcpiReset now bypasses the**  
 4245 **port**  
 4246 **validation mechanism. This may eventually be driven into the**  
 4247 **AcpiRead/Write**  
 1321 *register was one of the protected I/O ports. AcpiReset now bypasses the port*  
 1322 *validation mechanism. This may eventually be driven into the AcpiRead/Write*  
 4248 *interfaces.*

4250 Fixed a regression related to the recent update of the AcpiRead/Write  
 4251 **interfaces. A sleep/suspend could fail if the optional PM2 Control**  
 4252 **register**  
 1326 *interfaces. A sleep/suspend could fail if the optional PM2 Control register*

4253 does not exist during an attempt to write the Bus Master Arbitration bit.  
 4254 **(However, some hosts already delete the code that writes this bit, and**  
 4255 **the**  
 1328 *(However, some hosts already delete the code that writes this bit, and the*  
 4256 *code may in fact be obsolete at this date.)* ACPICA BZ 799.

4258 **Fixed a problem where AcpiTerminate could fault if inadvertently called**  
 4259 **twice**  
 1331 *Fixed a problem where AcpiTerminate could fault if inadvertently called twice*  
 4260 *in succession.* ACPICA BZ 795.

4262 Example Code and Data Size: These are the sizes for the OS-independent  
 4263 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4264 **debug version of the code includes the debug output trace mechanism and**  
 4265 **has a**  
 1336 *debug version of the code includes the debug output trace mechanism and has a*  
 4266 *much larger code and data size.*

4268 Previous Release:  
 4269 Non-Debug Version: 84.7K Code, 17.8K Data, 102.5K Total  
 4270 Debug Version: 160.5K Code, 50.6K Data, 211.1K Total  
 4271 Current Release:  
 4272 Non-Debug Version: 85.5K Code, 18.0K Data, 103.5K Total  
 4273 Debug Version: 161.6K Code, 50.9K Data, 212.5K Total

4275 2) iASL Compiler/Disassembler and Tools:

4277 ACPI 4.0: Implemented disassembler support for all new ACPI tables and  
 4278 changes to existing tables. ACPICA BZ 775.

4280 -----  
 4281 25 June 2009. Summary of changes for version 20090625:

4283 The ACPI 4.0 Specification was released on June 16 and is available at  
 4284 www.acpi.info. ACPICA implementation of ACPI 4.0 is underway and will  
 4285 continue for the next few releases.

4287 1) ACPI CA Core Subsystem:

4289 ACPI 4.0: Implemented interpreter support for the IPMI operation region  
 4290 **address space. Includes support for bi-directional data buffers and an**  
 4291 **IPMI**  
 4292 **address space handler (to be installed by an IPMI device driver.)** ACPICA  
 4293 **BZ**  
 1361 *address space. Includes support for bi-directional data buffers and an IPMI*  
 1362 *address space handler (to be installed by an IPMI device driver.)* ACPICA BZ  
 4294 773. Lin Ming.

4296 **ACPI 4.0: Added changes for existing ACPI tables - FACS and SRAT.**  
 4297 **Includes**  
 1365 *ACPI 4.0: Added changes for existing ACPI tables - FACS and SRAT. Includes*  
 4298 *support in both the header files and the disassembler.*

4300 Completed a major update for the AcpiGetObjectInfo external interface.  
 4301 Changes include:  
 4302 - Support for variable, unlimited length HID, UID, and CID strings.  
 4303 - **Support Processor objects the same as Devices (HID,UID,CID,ADR,STA,**  
 4304 **etc.)**  
 1371 *- Support Processor objects the same as Devices (HID,UID,CID,ADR,STA, etc.)*  
 4305 - Call the \_SxW power methods on behalf of a device object.  
 4306 - Determine if a device is a PCI root bridge.  
 4307 - Change the ACPI\_BUFFER parameter to ACPI\_DEVICE\_INFO.  
 4308 **These changes will require an update to all callers of this interface.**  
 4309 **See**  
 4310 **the updated ACPICA Programmer Reference for details. One new source file**  
 4311 **has**

1375 *These changes will require an update to all callers of this interface. See*  
 1376 *the updated ACPICA Programmer Reference for details. One new source file has*  
 4312 *been added - utilities/utids.c. ACPICA BZ 368, 780.*

4314 Updated the AcpiRead and AcpiWrite external interfaces to support 64-bit  
 4315 **transfers. The Value parameter has been extended from 32 bits to 64 bits**  
 4316 **in**  
 4317 **order to support new ACPI 4.0 tables. These changes will require an**  
 4318 **update**  
 4319 **to**  
 1380 *transfers. The Value parameter has been extended from 32 bits to 64 bits in*  
 1381 *order to support new ACPI 4.0 tables. These changes will require an update to*  
 4320 *all callers of these interfaces. See the ACPICA Programmer Reference for*  
 4321 *details.* ACPICA BZ 768.

4323 **Fixed several problems with AcpiAttachData. The handler was not invoked**  
 4324 **when**  
 4325 **the host node was deleted. The data sub-object was not automatically**  
 4326 **deleted**  
 4327 **when the host node was deleted. The interface to the handler had an**  
 4328 **unused**  
 1385 *Fixed several problems with AcpiAttachData. The handler was not invoked when*  
 1386 *the host node was deleted. The data sub-object was not automatically deleted*  
 1387 *when the host node was deleted. The interface to the handler had an unused*  
 4329 *parameter, this was removed.* ACPICA BZ 778.

4331 Enhanced the function that dumps ACPI table headers. All non-printable  
 4332 **characters in the string fields are now replaced with '?' (Signature,**  
 4333 **OemId,**  
 1391 *characters in the string fields are now replaced with '?' (Signature, OemId,*  
 4334 *OemTableId, and CompilerId.)* ACPI tables with non-printable characters in  
 4335 these fields are occasionally seen in the field. ACPICA BZ 788.

4337 Fixed a problem with predefined method repair code where the code that  
 4338 **attempts to repair/convert an object of incorrect type is only executed**  
 4339 **on**  
 4340 **the first time the predefined method is called. The mechanism that**  
 4341 **disables**  
 1396 *attempts to repair/convert an object of incorrect type is only executed on*  
 1397 *the first time the predefined method is called. The mechanism that disables*  
 4342 *warnings on subsequent calls was interfering with the repair mechanism.*  
 4343 *ACPICA BZ 781.*

4345 **Fixed a possible memory leak in the predefined validation/repair code**  
 4346 **when**  
 4347 **a**  
 1401 *Fixed a possible memory leak in the predefined validation/repair code when a*  
 4348 *buffer is automatically converted to an expected string object.*

4350 **Removed obsolete 16-bit files from the distribution and from the current**  
 4351 **git**  
 1404 *Removed obsolete 16-bit files from the distribution and from the current git*  
 4352 *tree head.* ACPICA BZ 776.

4354 Example Code and Data Size: These are the sizes for the OS-independent  
 4355 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4356 **debug version of the code includes the debug output trace mechanism and**  
 4357 **has a**  
 1409 *debug version of the code includes the debug output trace mechanism and has a*  
 4358 *much larger code and data size.*

4360 Previous Release:  
 4361 Non-Debug Version: 83.4K Code, 17.5K Data, 100.9K Total  
 4362 Debug Version: 158.9K Code, 50.0K Data, 208.9K Total  
 4363 Current Release:  
 4364 Non-Debug Version: 84.7K Code, 17.8K Data, 102.5K Total

4365        Debug Version:        160.5K Code, 50.6K Data, 211.1K Total

4367 2) iASL Compiler/Disassembler and Tools:

4369 ACPI 4.0: iASL and Disassembler - implemented support for the new IPMI  
4370 operation region keyword. ACPICA BZ 771, 772. Lin Ming.

4372 ACPI 4.0: iASL - implemented compile-time validation support for all new  
4373 predefined names and control methods (31 total). ACPICA BZ 769.

4375 -----

4376 21 May 2009. Summary of changes for version 20090521:

4378 1) ACPI CA Core Subsystem:

4380 **Disabled the preservation of the SCI enable bit in the PM1 control**  
4381 **register.**  
4382 **The SCI enable bit (bit 0, SCI\_EN) is defined by the ACPI specification**  
4383 **to**  
4384 **be**  
4385 *Disabled the preservation of the SCI enable bit in the PM1 control register.*  
4386 *The SCI enable bit (bit 0, SCI\_EN) is defined by the ACPI specification to be*  
4387 *a "preserved" bit - "OSPM always preserves this bit position", section*  
4388 *4.7.3.2.1. However, some machines fail if this bit is in fact preserved*  
4389 *because the bit needs to be explicitly set by the OS as a workaround. No*  
4390 *machines fail if the bit is not preserved. Therefore, ACPICA no longer*  
4391 *attempts to preserve this bit.*

4391 Fixed a problem in AcpiRsGetPciRoutingTableLength where an invalid or  
4392 incorrectly formed \_PRT package could cause a fault. Added validation to  
4393 ensure that each package element is actually a sub-package.

4395 **Implemented a new interface to install or override a single control**  
4396 **method,**  
4397 **AcpiInstallMethod. This interface is useful when debugging in order to**  
4398 **repair**  
4399 **an existing method or to install a missing method without having to**  
4400 **override**  
4401 *Implemented a new interface to install or override a single control method,*  
4402 *AcpiInstallMethod. This interface is useful when debugging in order to repair*  
4403 *an existing method or to install a missing method without having to override*  
4404 *the entire ACPI table. See the ACPICA Programmer Reference for use and*  
4405 *examples. Lin Ming, Bob Moore.*

4404 Fixed several reference count issues with the DdbHandle object that is  
4405 **created from a Load or LoadTable operator. Prevent premature deletion of**  
4406 **the**  
4407 **object. Also, mark the object as invalid once the table has been**  
4408 **unloaded.**  
4409 **This is needed because the handle itself may not be deleted after the**  
4410 **table**  
4411 *created from a Load or LoadTable operator. Prevent premature deletion of the*  
4412 *object. Also, mark the object as invalid once the table has been unloaded.*  
4413 *This is needed because the handle itself may not be deleted after the table*  
4414 *unload, depending on whether it has been stored in a named object by the*  
4415 *caller. Lin Ming.*

4414 Fixed a problem with Mutex Sync Levels. Fixed a problem where if multiple  
4415 **mutexes of the same sync level are acquired but then not released in**  
4416 **strict**  
4417 **opposite order, the internally maintained Current Sync Level becomes**  
4418 **confused**  
4419 *mutexes of the same sync level are acquired but then not released in strict*  
4420 *opposite order, the internally maintained Current Sync Level becomes confused*  
4421 *and can cause subsequent execution errors. ACPICA BZ 471.*

4421 Changed the allowable release order for ASL mutex objects. The ACPI 4.0  
4422 **specification has been changed to make the SyncLevel for mutex objects**  
4423 **more**  
4424 **useful. When releasing a mutex, the SyncLevel of the mutex must now be**  
4425 **the**  
4426 **same as the current sync level. This makes more sense than the previous**  
4427 **rule**  
4428 *specification has been changed to make the SyncLevel for mutex objects more*  
4429 *useful. When releasing a mutex, the SyncLevel of the mutex must now be the*  
4430 *same as the current sync level. This makes more sense than the previous rule*  
4431 *(SyncLevel less than or equal). This change updates the code to match the*  
4432 *specification.*

4431 **Fixed a problem with the local version of the AcpiOsPurgeCache function.**  
4432 **The**  
4433 *Fixed a problem with the local version of the AcpiOsPurgeCache function. The*  
4434 *(local) cache must be locked during all cache object deletions. Andrew*  
4435 *Baumann.*

4436 **Updated the Load operator to use operation region interfaces. This**  
4437 **replaces**  
4438 **direct memory mapping with region access calls. Now, all region accesses**  
4439 **go**  
4440 *Updated the Load operator to use operation region interfaces. This replaces*  
4441 *direct memory mapping with region access calls. Now, all region accesses go*  
4442 *through the installed region handler as they should.*

4442 **Simplified and optimized the NsGetNextNode function. Reduced parameter**  
4443 **count**  
4444 *Simplified and optimized the NsGetNextNode function. Reduced parameter count*  
4445 *and reduced code for this frequently used function.*

4446 Example Code and Data Size: These are the sizes for the OS-independent  
4447 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
4448 **debug version of the code includes the debug output trace mechanism and**  
4449 **has a**  
4450 *debug version of the code includes the debug output trace mechanism and has a*  
4451 *much larger code and data size.*

4452 Previous Release:  
4453 Non-Debug Version: 82.8K Code, 17.5K Data, 100.3K Total  
4454 Debug Version: 158.0K Code, 49.9K Data, 207.9K Total  
4455 Current Release:  
4456 Non-Debug Version: 83.4K Code, 17.5K Data, 100.9K Total  
4457 Debug Version: 158.9K Code, 50.0K Data, 208.9K Total

4459 2) iASL Compiler/Disassembler and Tools:

4461 **Disassembler: Fixed some issues with DMAR, HEST, MADT tables. Some**  
4462 **problems**  
4463 **with sub-table disassembly and handling invalid sub-tables. Attempt**  
4464 **recovery**  
4465 *Disassembler: Fixed some issues with DMAR, HEST, MADT tables. Some problems*  
4466 *with sub-table disassembly and handling invalid sub-tables. Attempt recovery*  
4467 *after an invalid sub-table ID.*

4467 -----

4468 22 April 2009. Summary of changes for version 20090422:

4470 1) ACPI CA Core Subsystem:

4472 **Fixed a compatibility issue with the recently released I/O port**  
4473 **protection**  
4474 *Fixed a compatibility issue with the recently released I/O port protection*  
4475 *mechanism. For windows compatibility, 1) On a port protection violation,*  
4476 *simply ignore the request and do not return an exception (allow the*

4476 **control**  
 1505 *simply ignore the request and do not return an exception (allow the control*  
 4477 *method to continue execution.)* 2) If only part of the request overlaps a  
 4478 **protected port, read/write the individual ports that are not protected.**  
 4479 **Linux**  
 1507 *protected port, read/write the individual ports that are not protected. Linux*  
 4480 BZ 13036. Lin Ming

4482 **Enhanced the execution of the ASL/AML BreakPoint operator so that it**  
 4483 **actually**  
 1510 *Enhanced the execution of the ASL/AML BreakPoint operator so that it actually*  
 4484 *breaks into the AML debugger if the debugger is present. This matches the*  
 4485 *ACPI-defined behavior.*

4487 Fixed several possible warnings related to the use of the configurable  
 4488 ACPI\_THREAD\_ID. This type can now be configured as either an integer or a  
 4489 pointer with no warnings. Also fixes several warnings in printf-like  
 4490 statements for the 64-bit build when the type is configured as a pointer.  
 4491 ACPICA BZ 766, 767.

4493 **Fixed a number of possible warnings when compiling with gcc 4+ (depending**  
 4494 **on**  
 4495 **warning options.) Examples include printf formats, aliasing, unused**  
 4496 **globals,**  
 1520 *Fixed a number of possible warnings when compiling with gcc 4+ (depending on*  
 1521 *warning options.) Examples include printf formats, aliasing, unused globals,*  
 4497 *missing prototypes, missing switch default statements, use of non-ANSI*  
 4498 **library functions, use of non-ANSI constructs. See generate/unix/Makefile**  
 4499 **for**  
 1523 *library functions, use of non-ANSI constructs. See generate/unix/Makefile for*  
 4500 *a list of warning options used with gcc 3 and 4. ACPICA BZ 735.*

4502 Example Code and Data Size: These are the sizes for the OS-independent  
 4503 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4504 **debug version of the code includes the debug output trace mechanism and**  
 4505 **has a**  
 1528 *debug version of the code includes the debug output trace mechanism and has a*  
 4506 *much larger code and data size.*

4508 Previous Release:  
 4509 Non-Debug Version: 82.6K Code, 17.6K Data, 100.2K Total  
 4510 Debug Version: 157.7K Code, 49.9K Data, 207.6K Total  
 4511 Current Release:  
 4512 Non-Debug Version: 82.8K Code, 17.5K Data, 100.3K Total  
 4513 Debug Version: 158.0K Code, 49.9K Data, 207.9K Total

4515 2) iASL Compiler/Disassembler and Tools:

4517 **iASL: Fixed a generation warning from Bison 2.3 and fixed several**  
 4518 **warnings**  
 4519 **on**  
 1540 *iASL: Fixed a generation warning from Bison 2.3 and fixed several warnings on*  
 4520 *the 64-bit build.*

4522 **iASL: Fixed a problem where the Unix/Linux versions of the compiler could**  
 4523 **not**  
 1543 *iASL: Fixed a problem where the Unix/Linux versions of the compiler could not*  
 4524 *correctly digest Windows/DOS formatted files (with CR/LF).*

4526 iASL: Added a new option for "quiet mode" (-va) that produces only the  
 4527 compilation summary, not individual errors and warnings. Useful for large  
 4528 batch compilations.

4530 **AcpiExec: Implemented a new option (-z) to enable a forced**  
 4531 **semaphore/mutex**  
 4532 **timeout that can be used to detect hang conditions during execution of**

4533 **AML**  
 4534 **code (includes both internal semaphores and AML-defined mutexes and**  
 4535 **events.)**  
 1550 *AcpiExec: Implemented a new option (-z) to enable a forced semaphore/mutex*  
 1551 *timeout that can be used to detect hang conditions during execution of AML*  
 1552 *code (includes both internal semaphores and AML-defined mutexes and events.)*

4537 Added new makefiles for the generation of acpica in a generic unix-like  
 4538 **environment. These makefiles are intended to generate the acpica tools**  
 4539 **and**  
 1555 *environment. These makefiles are intended to generate the acpica tools and*  
 4540 *utilities from the original acpica git source tree structure.*

4542 Test Suites: Updated and cleaned up the documentation files. Updated the  
 4543 **copyrights to 2009, affecting all source files. Use the new version of**  
 4544 **iASL**  
 4545 **with quiet mode. Increased the number of available semaphores in the**  
 4546 **Windows**  
 4547 **OSL, allowing the aslts to execute fully on Windows. For the Unix OSL,**  
 4548 **added**  
 1559 *copyrights to 2009, affecting all source files. Use the new version of iASL*  
 1560 *with quiet mode. Increased the number of available semaphores in the Windows*  
 1561 *OSL, allowing the aslts to execute fully on Windows. For the Unix OSL, added*  
 4549 *an alternate implementation of the semaphore timeout to allow aslts to*  
 4550 *execute fully on Cygwin.*

4552 -----  
 4553 20 March 2009. Summary of changes for version 20090320:

4555 1) ACPI CA Core Subsystem:

4557 **Fixed a possible race condition between AcpiWalkNamespace and dynamic**  
 4558 **table**  
 4559 **unloads. Added a reader/writer locking mechanism to allow multiple**  
 4560 **concurrent**  
 4561 **namespace walks (readers), but block a dynamic table unload until it can**  
 4562 **gain**  
 4563 **exclusive write access to the namespace. This fixes a problem where a**  
 4564 **table**  
 4565 **unload could (possibly catastrophically) delete the portion of the**  
 4566 **namespace**  
 4567 **that is currently being examined by a walk. Adds a new file, utlock.c,**  
 4568 **that**  
 1570 *Fixed a possible race condition between AcpiWalkNamespace and dynamic table*  
 1571 *unloads. Added a reader/writer locking mechanism to allow multiple concurrent*  
 1572 *namespace walks (readers), but block a dynamic table unload until it can gain*  
 1573 *exclusive write access to the namespace. This fixes a problem where a table*  
 1574 *unload could (possibly catastrophically) delete the portion of the namespace*  
 1575 *that is currently being examined by a walk. Adds a new file, utlock.c, that*  
 4569 *implements the reader/writer lock mechanism. ACPICA BZ 749.*

4571 **Fixed a regression introduced in version 20090220 where a change to the**  
 4572 **FADT**  
 4573 **handling could cause the ACPICA subsystem to access non-existent I/O**  
 4574 **ports.**  
 1578 *Fixed a regression introduced in version 20090220 where a change to the FADT*  
 1579 *handling could cause the ACPICA subsystem to access non-existent I/O ports.*

4576 **Modified the handling of FADT register and table (FACS/DSDT) addresses.**  
 4577 **The**  
 1581 *Modified the handling of FADT register and table (FACS/DSDT) addresses. The*  
 4578 *FADT can contain both 32-bit and 64-bit versions of these addresses.*  
 4579 *Previously, the 64-bit versions were favored, meaning that if both 32 and*  
 4580 *64*  
 1583 *Previously, the 64-bit versions were favored, meaning that if both 32 and 64*  
 4581 *versions were valid, but not equal, the 64-bit version was used. This was*

4582 found to cause some machines to fail. Now, in this case, the 32-bit  
4583 version  
1585 found to cause some machines to fail. Now, in this case, the 32-bit version  
4584 is used instead. This now matches the Windows behavior.

4586 Implemented a new mechanism to protect certain I/O ports. Provides  
4587 Microsoft  
1588 Implemented a new mechanism to protect certain I/O ports. Provides Microsoft  
4588 compatibility and protects the standard PC I/O ports from access via AML  
4589 code. Adds a new file, hwvalid.c

4591 Fixed a possible extraneous warning message from the FADT support. The  
4592 message warns of a 32/64 length mismatch between the legacy and GAS  
4593 definitions for a register.

4595 Removed the obsolete AcpiOsValidateAddress OSL interface. This interface  
4596 is  
4597 made obsolete by the port protection mechanism above. It was previously  
4598 used  
4599 to validate the entire address range of an operation region, which could  
4600 be  
1596 Removed the obsolete AcpiOsValidateAddress OSL interface. This interface is  
1597 made obsolete by the port protection mechanism above. It was previously used  
1598 to validate the entire address range of an operation region, which could be  
4601 incorrect if the range included illegal ports, but fields within the  
4602 operation region did not actually access those ports. Validation is now  
4603 performed on a per-field basis instead of the entire region.

4605 Modified the handling of the PM1 Status Register ignored bit (bit 11.)  
4606 Ignored bits must be "preserved" according to the ACPI spec. Usually,  
4607 this  
4608 means a read/modify/write when writing to the register. However, for  
4609 status  
4610 registers, writing a one means clear the event. Writing a zero means  
4611 preserve  
4612 the event (do not clear.) This behavior is clarified in the ACPI 4.0  
4613 spec,  
1604 Ignored bits must be "preserved" according to the ACPI spec. Usually, this  
1605 means a read/modify/write when writing to the register. However, for status  
1606 registers, writing a one means clear the event. Writing a zero means preserve  
1607 the event (do not clear.) This behavior is clarified in the ACPI 4.0 spec,  
4614 and the ACPICA code now simply always writes a zero to the ignored bit.

4616 Modified the handling of ignored bits for the PM1 A/B Control Registers.  
4617 As  
1610 Modified the handling of ignored bits for the PM1 A/B Control Registers. As  
4618 per the ACPI specification, for the control registers, preserve  
4619 (read/modify/write) all bits that are defined as either reserved or  
4620 ignored.  
1612 (read/modify/write) all bits that are defined as either reserved or ignored.

4622 Updated the handling of write-only bits in the PM1 A/B Control Registers.  
4623 When reading the register, zero the write-only bits as per the ACPI spec.  
4624 ACPICA BZ 443. Lin Ming.

4626 Removed "Linux" from the list of supported \_OSI strings. Linux no longer  
4627 wants to reply true to this request. The Windows strings are the only  
4628 paths  
1619 wants to reply true to this request. The Windows strings are the only paths  
4629 through the AML that are tested and known to work properly.

4631 Previous Release:  
4632 Non-Debug Version: 82.0K Code, 17.5K Data, 99.5K Total  
4633 Debug Version: 156.9K Code, 49.8K Data, 206.7K Total  
4634 Current Release:  
4635 Non-Debug Version: 82.6K Code, 17.6K Data, 100.2K Total

4636 Debug Version: 157.7K Code, 49.9K Data, 207.6K Total

4638 2) iASL Compiler/Disassembler and Tools:

4640 Acpiexec: Split the large aeexec.c file into two new files, aehandlers.c  
4641 and  
1631 Acpiexec: Split the large aeexec.c file into two new files, aehandlers.c and  
4642 aetables.c

4644 -----  
4645 20 February 2009. Summary of changes for version 20090220:

4647 1) ACPI CA Core Subsystem:

4649 Optimized the ACPI register locking. Removed locking for reads from the  
4650 ACPI  
4651 bit registers in PM1 Status, Enable, Control, and PM2 Control. The lock  
4652 is  
1639 Optimized the ACPI register locking. Removed locking for reads from the ACPI  
1640 bit registers in PM1 Status, Enable, Control, and PM2 Control. The lock is  
4653 not required when reading the single-bit registers. The  
4654 AcpiGetRegisterUnlocked function is no longer needed and has been  
4655 removed.  
4656 This will improve performance for reads on these registers. ACPICA BZ  
4657 760.  
1642 AcpiGetRegisterUnlocked function is no longer needed and has been removed.  
1643 This will improve performance for reads on these registers. ACPICA BZ 760.

4659 Fixed the parameter validation for AcpiRead/Write. Now return  
4660 AE\_BAD\_PARAMETER if the input register pointer is null, and  
4661 AE\_BAD\_ADDRESS  
4662 if  
4663 the register has an address of zero. Previously, these cases simply  
4664 returned  
4665 AE\_OK. For optional registers such as PM1B status/enable/control, the  
4666 caller  
1646 AE\_BAD\_PARAMETER if the input register pointer is null, and AE\_BAD\_ADDRESS if  
1647 the register has an address of zero. Previously, these cases simply returned  
1648 AE\_OK. For optional registers such as PM1B status/enable/control, the caller  
4667 should check for a valid register address before calling. ACPICA BZ 748.

4669 Renamed the external ACPI bit register access functions. Renamed  
4670 AcpiGetRegister and AcpiSetRegister to clarify the purpose of these  
4671 functions. The new names are AcpiReadBitRegister and  
4672 AcpiWriteBitRegister.  
4673 Also, restructured the code for these functions by simplifying the code  
4674 path  
1653 functions. The new names are AcpiReadBitRegister and AcpiWriteBitRegister.  
1654 Also, restructured the code for these functions by simplifying the code path  
4675 and condensing duplicate code to reduce code size.

4677 Added new functions to transparently handle the possibly split PM1 A/B  
4678 registers. AcpiHwReadMultiple and AcpiHwWriteMultiple. These two  
4679 functions  
4680 now handle the split registers for PM1 Status, Enable, and Control.  
4681 ACPICA  
4682 BZ  
1658 registers. AcpiHwReadMultiple and AcpiHwWriteMultiple. These two functions  
1659 now handle the split registers for PM1 Status, Enable, and Control. ACPICA BZ  
4683 746.

4685 Added a function to handle the PM1 control registers,  
4686 AcpiHwWritePm1Control.  
4687 This function writes both of the PM1 control registers (A/B). These  
4688 registers  
4689 are different than the PM1 A/B status and enable registers in that

4690 different  
 4691 values can be written to the A/B registers. Most notably, the SLP\_TYP  
 4692 bits  
 4693 can be different, as per the values returned from the \_Sx predefined  
 4694 methods.  
 1662 Added a function to handle the PM1 control registers, AcpiHwWritePmlControl.  
 1663 This function writes both of the PM1 control registers (A/B). These registers  
 1664 are different than the PM1 A/B status and enable registers in that different  
 1665 values can be written to the A/B registers. Most notably, the SLP\_TYP bits  
 1666 can be different, as per the values returned from the \_Sx predefined methods.

4696 Removed an extra register write within AcpiHwClearAcpiStatus. This  
 4697 function  
 4698 was writing an optional PM1B status register twice. The existing call to  
 4699 the  
 4700 low-level AcpiHwRegisterWrite automatically handles a possibly split PM1  
 4701 A/B  
 1668 Removed an extra register write within AcpiHwClearAcpiStatus. This function  
 1669 was writing an optional PM1B status register twice. The existing call to the  
 1670 low-level AcpiHwRegisterWrite automatically handles a possibly split PM1 A/B  
 4702 register. ACPICA BZ 751.

4704 Split out the PM1 Status registers from the FADT. Added new globals for  
 4705 these  
 1673 Split out the PM1 Status registers from the FADT. Added new globals for these  
 4706 registers (A/B), similar to the way the PM1 Enable registers are handled.  
 4707 Instead of overloading the FADT Event Register blocks. This makes the  
 4708 code  
 1675 Instead of overloading the FADT Event Register blocks. This makes the code  
 4709 clearer and less prone to error.

4711 Fixed the warning message for when the platform contains too many ACPI  
 4712 tables  
 4713 for the default size of the global root table data structure. The  
 4714 calculation  
 1678 Fixed the warning message for when the platform contains too many ACPI tables  
 1679 for the default size of the global root table data structure. The calculation  
 4715 for the truncation value was incorrect.

4717 Removed the ACPI\_GET\_OBJECT\_TYPE macro. Removed all instances of this  
 4718 obsolete macro, since it is now a simple reference to ->common.type.  
 4719 There  
 1683 obsolete macro, since it is now a simple reference to ->common.type. There  
 4720 were about 150 invocations of the macro across 41 files. ACPICA BZ 755.

4722 Removed the redundant ACPI\_BITREG\_SLEEP\_TYPE\_B. This type is the same as  
 4723 TYPE\_A. Removed this and all related instances. Renamed SLEEP\_TYPE\_A to  
 4724 simply SLEEP\_TYPE. ACPICA BZ 754.

4726 Conditionally compile the AcpiSetFirmwareWakingVector64 function. This  
 4727 function is only needed on 64-bit host operating systems and is thus not  
 4728 included for 32-bit hosts.

4730 Debug output: print the input and result for invocations of the \_OSI  
 4731 reserved  
 4732 control method via the ACPI\_LV\_INFO debug level. Also, reduced some of  
 4733 the  
 1694 Debug output: print the input and result for invocations of the \_OSI reserved  
 1695 control method via the ACPI\_LV\_INFO debug level. Also, reduced some of the  
 4734 verbosity of this debug level. Len Brown.

4736 Example Code and Data Size: These are the sizes for the OS-independent  
 4737 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4738 debug version of the code includes the debug output trace mechanism and  
 4739 has a  
 1700 debug version of the code includes the debug output trace mechanism and has a

4740 much larger code and data size.

4742 Previous Release:  
 4743 Non-Debug Version: 82.3K Code, 17.5K Data, 99.8K Total  
 4744 Debug Version: 157.3K Code, 49.8K Data, 207.1K Total  
 4745 Current Release:  
 4746 Non-Debug Version: 82.0K Code, 17.5K Data, 99.5K Total  
 4747 Debug Version: 156.9K Code, 49.8K Data, 206.7K Total

4749 2) iASL Compiler/Disassembler and Tools:

4751 Disassembler: Decode the FADT PM\_Profile field. Emit ascii names for the  
 4752 various legal performance profiles.

4754 -----  
 4755 23 January 2009. Summary of changes for version 20090123:

4757 1) ACPI CA Core Subsystem:

4759 Added the 2009 copyright to all module headers and signons. This affects  
 4760 virtually every file in the ACPICA core subsystem, the iASL compiler, and  
 4761 the tools/utilities.

4763 Implemented a change to allow the host to override any ACPI table,  
 4764 including  
 4765 dynamically loaded tables. Previously, only the DSDT could be replaced by  
 4766 the  
 4767 host. With this change, the AcpiOsTableOverride interface is called for  
 4768 each  
 4769 table found in the RSDT/XSDT during ACPICA initialization, and also  
 4770 whenever  
 1724 Implemented a change to allow the host to override any ACPI table, including  
 1725 dynamically loaded tables. Previously, only the DSDT could be replaced by the  
 1726 host. With this change, the AcpiOsTableOverride interface is called for each  
 1727 table found in the RSDT/XSDT during ACPICA initialization, and also whenever  
 4771 a table is dynamically loaded via the AML Load operator.

4773 Updated FADT flag definitions, especially the Boot Architecture flags.

4775 Debugger: For the Find command, automatically pad the input ACPI name  
 4776 with  
 4777 underscores if the name is shorter than 4 characters. This enables a  
 4778 match  
 1732 Debugger: For the Find command, automatically pad the input ACPI name with  
 1733 underscores if the name is shorter than 4 characters. This enables a match  
 4779 with the actual namespace entry which is itself padded with underscores.

4781 Example Code and Data Size: These are the sizes for the OS-independent  
 4782 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4783 debug version of the code includes the debug output trace mechanism and  
 4784 has a  
 1738 debug version of the code includes the debug output trace mechanism and has a  
 4785 much larger code and data size.

4787 Previous Release:  
 4788 Non-Debug Version: 82.3K Code, 17.4K Data, 99.7K Total  
 4789 Debug Version: 157.1K Code, 49.7K Data, 206.8K Total  
 4790 Current Release:  
 4791 Non-Debug Version: 82.3K Code, 17.5K Data, 99.8K Total  
 4792 Debug Version: 157.3K Code, 49.8K Data, 207.1K Total

4794 2) iASL Compiler/Disassembler and Tools:

4796 Fix build error under Bison-2.4.

4798 Disassembler: Enhanced FADT support. Added decoding of the Boot

4799 **Architecture**

1752 *Dissassembler: Enhanced FADT support. Added decoding of the Boot Architecture*  
 4800 flags. Now decode all flags, regardless of the FADT version. Flag output  
 4801 includes the FADT version which first defined each flag.

4803 **The iASL -g option now dumps the RSDT to a file (in addition to the FADT**  
 4804 **and**  
 1756 *The iASL -g option now dumps the RSDT to a file (in addition to the FADT and*  
 4805 DSDT). Windows only.

4807 -----  
 4808 04 December 2008. Summary of changes for version 20081204:

4810 1) ACPI CA Core Subsystem:

4812 **The ACPICA Programmer Reference has been completely updated and revamped**  
 4813 **for**  
 1764 *The ACPICA Programmer Reference has been completely updated and revamped for*  
 4814 this release. This includes updates to the external interfaces, OSL  
 4815 interfaces, the overview sections, and the debugger reference.

4817 Several new ACPICA interfaces have been implemented and documented in the  
 4818 programmer reference:  
 4819 AcpiReset - Writes the reset value to the FADT-defined reset register.  
 4820 AcpiDisableAllGpes - Disable all available GPEs.  
 4821 AcpiEnableAllRuntimeGpes - Enable all available runtime GPEs.  
 4822 AcpiGetGpeDevice - Get the GPE block device associated with a GPE.  
 4823 AcpiGbl\_CurrentGpeCount - Tracks the current number of available GPEs.  
 4824 AcpiRead - Low-level read ACPI register (was HwLowLevelRead.)  
 4825 AcpiWrite - Low-level write ACPI register (was HwLowLevelWrite.)

4827 **Most of the public ACPI hardware-related interfaces have been moved to a**  
 4828 **new**  
 1778 *Most of the public ACPI hardware-related interfaces have been moved to a new*  
 4829 file, components/hardware/hwxface.c

4831 Enhanced the FADT parsing and low-level ACPI register access: The ACPI  
 4832 register lengths within the FADT are now used, and the low level ACPI  
 4833 register access no longer hardcodes the ACPI register lengths. Given that  
 4834 **there may be some risk in actually trusting the FADT register lengths, a**  
 4835 **run-**  
 4836 **time option was added to fall back to the default hardcoded lengths if**  
 4837 **the**  
 1784 *there may be some risk in actually trusting the FADT register lengths, a run-*  
 1785 *time option was added to fall back to the default hardcoded lengths if the*  
 4838 FADT proves to contain incorrect values - UseDefaultRegisterWidths. This  
 4839 **option is set to true for now, and a warning is issued if a suspicious**  
 4840 **FADT**  
 1787 *option is set to true for now, and a warning is issued if a suspicious FADT*  
 4841 register length is overridden with the default value.

4843 **Fixed a reference count issue in NsRepairObject. This problem was**  
 4844 **introduced**  
 1790 *Fixed a reference count issue in NsRepairObject. This problem was introduced*  
 4845 in version 20081031 as part of a fix to repair Buffer objects within  
 4846 Packages. Lin Ming.

4848 Added semaphore support to the Linux/Unix application OS-services layer  
 4849 (OSL). ACPICA BZ 448. Lin Ming.

4851 **Added the ACPI\_MUTEX\_TYPE configuration option to select whether mutexes**  
 4852 **will**  
 1797 *Added the ACPI\_MUTEX\_TYPE configuration option to select whether mutexes will*  
 4853 be implemented in the OSL, or will binary semaphores be used instead.

4855 Example Code and Data Size: These are the sizes for the OS-independent

4856 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4857 **debug version of the code includes the debug output trace mechanism and**  
 4858 **has a**  
 1802 *debug version of the code includes the debug output trace mechanism and has a*  
 4859 much larger code and data size.

4861 Previous Release:  
 4862 Non-Debug Version: 81.7K Code, 17.3K Data, 99.0K Total  
 4863 Debug Version: 156.4K Code, 49.4K Data, 205.8K Total  
 4864 Current Release:  
 4865 Non-Debug Version: 82.3K Code, 17.4K Data, 99.7K Total  
 4866 Debug Version: 157.1K Code, 49.7K Data, 206.8K Total

4868 2) iASL Compiler/Disassembler and Tools:

4870 **iASL: Completed the '-e' option to include additional ACPI tables in**  
 4871 **order**  
 4872 **to**  
 4873 **aid with disassembly and External statement generation. ACPICA BZ 742.**  
 4874 **Lin**  
 1814 *iASL: Completed the '-e' option to include additional ACPI tables in order to*  
 1815 *aid with disassembly and External statement generation. ACPICA BZ 742. Lin*  
 4875 Ming.

4877 iASL: Removed the "named object in while loop" error. The compiler cannot  
 4878 determine how many times a loop will execute. ACPICA BZ 730.

4880 **Disassembler: Implemented support for FADT revision 2 (MS extension).**  
 4881 **ACPICA**  
 1821 *Disassembler: Implemented support for FADT revision 2 (MS extension). ACPICA*  
 4882 BZ 743.

4884 **Disassembler: Updates for several ACPI data tables (HEST, EINJ, and**  
 4885 **MCFG).**  
 1824 *Disassembler: Updates for several ACPI data tables (HEST, EINJ, and MCFG).*

4887 -----  
 4888 31 October 2008. Summary of changes for version 20081031:

4890 1) ACPI CA Core Subsystem:

4892 **Restructured the ACPICA header files into public/private. acpi.h now**  
 4893 **includes**  
 4894 **only the "public" acpica headers. All other acpica headers are "private"**  
 4895 **and**  
 4896 **should not be included by acpica users. One new file, accommon.h is used**  
 4897 **to**  
 4898 **include the commonly used private headers for acpica code generation.**  
 4899 **Future**  
 1831 *Restructured the ACPICA header files into public/private. acpi.h now includes*  
 1832 *only the "public" acpica headers. All other acpica headers are "private" and*  
 1833 *should not be included by acpica users. One new file, accommon.h is used to*  
 1834 *include the commonly used private headers for acpica code generation. Future*  
 4900 plans include moving all private headers to a new subdirectory.

4902 Implemented an automatic Buffer->String return value conversion for  
 4903 **predefined ACPI methods. For these methods (such as \_BIF), added**  
 4904 **automatic**  
 4905 **conversion for return objects that are required to be a String, but a**  
 4906 **Buffer**  
 4907 **was found instead. This can happen when reading string battery data from**  
 4908 **an**  
 4909 **operation region, because it used to be difficult to convert the data**  
 4910 **from**  
 4911 **buffer to string from within the ASL. Ensures that the host OS is**  
 4912 **provided**

1838 predefined ACPI methods. For these methods (such as \_BIF), added automatic  
 1839 conversion for return objects that are required to be a String, but a Buffer  
 1840 was found instead. This can happen when reading string battery data from an  
 1841 operation region, because it used to be difficult to convert the data from  
 1842 buffer to string from within the ASL. Ensures that the host OS is provided  
 1913 with a valid null-terminated string. Linux BZ 11822.

4915 Updated the FACS waking vector interfaces. Split  
 4916 AcpiSetFirmwareWakingVector  
 4917 into two: one for the 32-bit vector, another for the 64-bit vector. This  
 4918 is  
 4919 required because the host OS must setup the wake much differently for  
 4920 each  
 4921 vector (real vs. protected mode, etc.) and the interface itself should  
 4922 not  
 4923 be  
 4924 deciding which vector to use. Also, eliminated the  
 4925 GetFirmwareWakingVector  
 4926 interface, as it served no purpose (only the firmware reads the vector,  
 4927 OS  
 1845 Updated the FACS waking vector interfaces. Split AcpiSetFirmwareWakingVector  
 1846 into two: one for the 32-bit vector, another for the 64-bit vector. This is  
 1847 required because the host OS must setup the wake much differently for each  
 1848 vector (real vs. protected mode, etc.) and the interface itself should not be  
 1849 deciding which vector to use. Also, eliminated the GetFirmwareWakingVector  
 1850 interface, as it served no purpose (only the firmware reads the vector, OS  
 4928 only writes the vector.) ACPICA BZ 731.

4930 Implemented a mechanism to escape infinite AML While() loops. Added a  
 4931 loop  
 4932 counter to force exit from AML While loops if the count becomes too  
 4933 large.  
 1853 Implemented a mechanism to escape infinite AML While() loops. Added a loop  
 1854 counter to force exit from AML While loops if the count becomes too large.  
 4934 This can occur in poorly written AML when the hardware does not respond  
 4935 within a while loop and the loop does not implement a timeout. The  
 4936 maximum  
 4937 loop count is configurable. A new exception code is returned when a loop  
 4938 is  
 1856 within a while loop and the loop does not implement a timeout. The maximum  
 1857 loop count is configurable. A new exception code is returned when a loop is  
 4939 broken, AE\_AML\_INFINITE\_LOOP. Alexey Starikovskiy, Bob Moore.

4941 Optimized the execution of AML While loops. Previously, a control state  
 4942 object was allocated and freed for each execution of the loop. The  
 4943 optimization is to simply reuse the control state for each iteration.  
 4944 This  
 1862 optimization is to simply reuse the control state for each iteration. This  
 4945 speeds up the raw loop execution time by about 5%.

4947 Enhanced the implicit return mechanism. For Windows compatibility, return  
 4948 an  
 4949 implicit integer of value zero for methods that contain no executable  
 4950 code.  
 1865 Enhanced the implicit return mechanism. For Windows compatibility, return an  
 1866 implicit integer of value zero for methods that contain no executable code.  
 4951 Such methods are seen in the field as stubs (presumably), and can cause  
 4952 drivers to fail if they expect a return value. Lin Ming.

4954 Allow multiple backslashes as root prefixes in namepaths. In a fully  
 4955 qualified namepath, allow multiple backslash prefixes. This can happen  
 4956 (and  
 1871 qualified namepath, allow multiple backslash prefixes. This can happen (and  
 4957 is seen in the field) because of the use of a double-backslash in strings  
 4958 (since backslash is the escape character) causing confusion. ACPICA BZ  
 4959 739

1873 (since backslash is the escape character) causing confusion. ACPICA BZ 739  
 4960 Lin Ming.

4962 Emit a warning if two different FACS or DSDT tables are discovered in the  
 4963 FADT. Checks if there are two valid but different addresses for the FACS  
 4964 and  
 1877 FADT. Checks if there are two valid but different addresses for the FACS and  
 4965 DSDT within the FADT (mismatch between the 32-bit and 64-bit fields.)

4967 Consolidated the method argument count validation code. Merged the code  
 4968 that  
 1880 Consolidated the method argument count validation code. Merged the code that  
 4969 validates control method argument counts into the predefined validation  
 4970 module. Eliminates possible multiple warnings for incorrect argument  
 4971 counts.  
 1882 module. Eliminates possible multiple warnings for incorrect argument counts.

4973 Implemented ACPICA example code. Includes code for ACPICA initialization,  
 4974 handler installation, and calling a control method. Available at  
 4975 source/tools/examples.

4977 Added a global pointer for FACS table to simplify internal FACS access.  
 4978 Use  
 4979 the global pointer instead of using AcpiGetTableByIndex for each FACS  
 4980 access.  
 1888 Added a global pointer for FACS table to simplify internal FACS access. Use  
 1889 the global pointer instead of using AcpiGetTableByIndex for each FACS access.  
 4981 This simplifies the code for the Global Lock and the Firmware Waking  
 4982 Vector(s).

4984 Example Code and Data Size: These are the sizes for the OS-independent  
 4985 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 4986 debug version of the code includes the debug output trace mechanism and  
 4987 has a  
 1895 debug version of the code includes the debug output trace mechanism and has a  
 4988 much larger code and data size.

4990 Previous Release:  
 4991 Non-Debug Version: 81.2K Code, 17.0K Data, 98.2K Total  
 4992 Debug Version: 155.8K Code, 49.1K Data, 204.9K Total  
 4993 Current Release:  
 4994 Non-Debug Version: 81.7K Code, 17.3K Data, 99.0K Total  
 4995 Debug Version: 156.4K Code, 49.4K Data, 205.8K Total

4997 2) iASL Compiler/Disassembler and Tools:

4999 iASL: Improved disassembly of external method calls. Added the -e option  
 5000 to  
 5001 allow the inclusion of additional ACPI tables to help with the  
 5002 disassembly  
 5003 of  
 1907 iASL: Improved disassembly of external method calls. Added the -e option to  
 1908 allow the inclusion of additional ACPI tables to help with the disassembly of  
 5004 method invocations and the generation of external declarations during the  
 5005 disassembly. Certain external method invocations cannot be disassembled  
 5006 properly without the actual declaration of the method. Use the -e option  
 5007 to  
 5008 include the table where the external method(s) are actually declared.  
 5009 Most  
 1911 properly without the actual declaration of the method. Use the -e option to  
 1912 include the table where the external method(s) are actually declared. Most  
 5010 useful for disassembling SSDTs that make method calls back to the master  
 5011 DSDT. Lin Ming. Example: To disassemble an SSDT with calls to DSDT: iasl  
 5012 -d  
 1914 DSDT. Lin Ming. Example: To disassemble an SSDT with calls to DSDT: iasl -d  
 5013 -e dsdt.aml ssdt1.aml

5015 iASL: Fix to allow references to aliases within ASL namepaths. Fixes a  
 5016 problem where the use of an alias within a namepath would result in a not  
 5017 found error or cause the compiler to fault. Also now allows forward  
 5018 references from the Alias operator itself. ACPICA BZ 738.

5020 -----  
 5021 26 September 2008. Summary of changes for version 20080926:

5023 1) ACPI CA Core Subsystem:

5025 **Designed and implemented a mechanism to validate predefined ACPI methods**  
 5026 **and**  
 5027 **objects. This code validates the predefined ACPI objects (objects whose**  
 5028 **names**  
 1927 *Designed and implemented a mechanism to validate predefined ACPI methods and*  
 1928 *objects. This code validates the predefined ACPI objects (objects whose names*  
 5029 *start with underscore) that appear in the namespace, at the time they are*  
 5030 *evaluated. The argument count and the type of the returned object are*  
 5031 **validated against the ACPI specification. The purpose of this validation**  
 5032 **is**  
 5033 **to detect problems with the BIOS-implemented predefined ACPI objects**  
 5034 **before**  
 5035 **the results are returned to the ACPI-related drivers. Future enhancements**  
 5036 **may**  
 1931 *validated against the ACPI specification. The purpose of this validation is*  
 1932 *to detect problems with the BIOS-implemented predefined ACPI objects before*  
 1933 *the results are returned to the ACPI-related drivers. Future enhancements may*  
 5037 *include actual repair of incorrect return objects where possible. Two new*  
 5038 *files are nspredef.c and acpredef.h.*

5040 **Fixed a fault in the AML parser if a memory allocation fails during the**  
 5041 **Op**  
 1937 *Fixed a fault in the AML parser if a memory allocation fails during the Op*  
 5042 *completion routine AcpiPsCompleteThisOp. Lin Ming. ACPICA BZ 492.*

5044 **Fixed an issue with implicit return compatibility. This change improves**  
 5045 **the**  
 5046 **implicit return mechanism to be more compatible with the MS interpreter.**  
 5047 **Lin**  
 1940 *Fixed an issue with implicit return compatibility. This change improves the*  
 1941 *implicit return mechanism to be more compatible with the MS interpreter. Lin*  
 5048 *Ming, ACPICA BZ 349.*

5050 **Implemented support for zero-length buffer-to-string conversions. Allow**  
 5051 **zero**  
 5052 **length strings during interpreter buffer-to-string conversions. For**  
 5053 **example,**  
 1944 *Implemented support for zero-length buffer-to-string conversions. Allow zero*  
 1945 *length strings during interpreter buffer-to-string conversions. For example,*  
 5054 *during the ToDecimalString and ToHexString operators, as well as implicit*  
 5055 *conversions. Fiodor Suietov, ACPICA BZ 585.*

5057 **Fixed two possible memory leaks in the error exit paths of**  
 5058 **AcpiUtUpdateObjectReference and AcpiUtWalkPackageTree. These functions**  
 5059 **are**  
 1950 *AcpiUtUpdateObjectReference and AcpiUtWalkPackageTree. These functions are*  
 5060 *similar in that they use a stack of state objects in order to eliminate*  
 5061 *recursion. The stack must be fully unwound and deallocated if an error*  
 5062 *occurs. Lin Ming. ACPICA BZ 383.*

5064 **Removed the unused ACPI\_BITREG\_WAKE\_ENABLE definition and entry in the**  
 5065 **global**  
 1955 *Removed the unused ACPI\_BITREG\_WAKE\_ENABLE definition and entry in the global*  
 5066 *ACPI register table. This bit does not exist and is unused. Lin Ming, Bob*  
 5067 *Moore ACPICA BZ 442.*

5069 **Removed the obsolete version number in module headers. Removed the**  
 5070 **"\$Revision" number that appeared in each module header. This version**  
 5071 **number**  
 5072 **was useful under SourceSafe and CVS, but has no meaning under git. It is**  
 5073 **not**  
 1960 *"\$Revision" number that appeared in each module header. This version number*  
 1961 *was useful under SourceSafe and CVS, but has no meaning under git. It is not*  
 5074 *only incorrect, it could also be misleading.*

5076 **Example Code and Data Size: These are the sizes for the OS-independent**  
 5077 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The**  
 5078 **debug version of the code includes the debug output trace mechanism and**  
 5079 **has a**  
 1966 *debug version of the code includes the debug output trace mechanism and has a*  
 5080 *much larger code and data size.*

5082 Previous Release:  
 5083 Non-Debug Version: 79.7K Code, 16.4K Data, 96.1K Total  
 5084 Debug Version: 153.7K Code, 48.2K Data, 201.9K Total  
 5085 Current Release:  
 5086 Non-Debug Version: 81.2K Code, 17.0K Data, 98.2K Total  
 5087 Debug Version: 155.8K Code, 49.1K Data, 204.9K Total

5089 -----  
 5090 29 August 2008. Summary of changes for version 20080829:

5092 1) ACPI CA Core Subsystem:

5094 **Completed a major cleanup of the internal ACPI\_OPERAND\_OBJECT of type**  
 5095 **Reference. Changes include the elimination of cheating on the Object**  
 5096 **field**  
 1982 *Reference. Changes include the elimination of cheating on the Object field*  
 5097 *for the DdbHandle subtype, addition of a reference class field to*  
 5098 **differentiate the various reference types (instead of an AML opcode), and**  
 5099 **the**  
 1984 *differentiate the various reference types (instead of an AML opcode), and the*  
 5100 *cleanup of debug output for this object. Lin Ming, Bob Moore. BZ 723*

5102 **Reduce an error to a warning for an incorrect method argument count.**  
 5103 **Previously aborted with an error if too few arguments were passed to a**  
 5104 **control method via the external ACPICA interface. Now issue a warning**  
 5105 **instead**  
 5106 **and continue. Handles the case where the method inadvertently declares**  
 5107 **too**  
 5108 **many arguments, but does not actually use the extra ones. Applies mainly**  
 5109 **to**  
 1989 *control method via the external ACPICA interface. Now issue a warning instead*  
 1990 *and continue. Handles the case where the method inadvertently declares too*  
 1991 *many arguments, but does not actually use the extra ones. Applies mainly to*  
 5110 *the predefined methods. Lin Ming. Linux BZ 11032.*

5112 **Disallow the evaluation of named object types with no intrinsic value.**  
 5113 **Return**  
 5114 **AE\_TYPE for objects that have no value and therefore evaluation is**  
 5115 **undefined:**  
 5116 **Device, Event, Mutex, Region, Thermal, and Scope. Previously, evaluation**  
 5117 **of**  
 5118 **these types were allowed, but an exception would be generated at some**  
 5119 **point**  
 1994 *Disallow the evaluation of named object types with no intrinsic value. Return*  
 1995 *AE\_TYPE for objects that have no value and therefore evaluation is undefined:*  
 1996 *Device, Event, Mutex, Region, Thermal, and Scope. Previously, evaluation of*  
 1997 *these types were allowed, but an exception would be generated at some point*  
 5120 *during the evaluation. Now, the error is generated up front.*

5122 Fixed a possible memory leak in the AcpiNsGetExternalPathname function  
 5123 (nsnames.c). Fixes a leak in the error exit path.

5125 **Removed the obsolete debug levels ACPI\_DB\_WARN and ACPI\_DB\_ERROR. These**  
 5126 **debug**  
 5127 **levels were made obsolete by the ACPI\_WARNING, ACPI\_ERROR, and**  
 5128 **ACPI\_EXCEPTION**  
 2003 *Removed the obsolete debug levels ACPI\_DB\_WARN and ACPI\_DB\_ERROR. These debug*  
 2004 *levels were made obsolete by the ACPI\_WARNING, ACPI\_ERROR, and ACPI\_EXCEPTION*  
 5129 *interfaces. Also added ACPI\_DB\_EVENTS to correspond with the existing*  
 5130 *ACPI\_LV\_EVENTS.*

5132 Removed obsolete and/or unused exception codes from the acexcep.h header.  
 5133 **There is the possibility that certain device drivers may be affected if**  
 5134 **they**  
 2009 *There is the possibility that certain device drivers may be affected if they*  
 5135 *use any of these exceptions.*

5137 **The ACPICA documentation has been added to the public git source tree,**  
 5138 **under**  
 2012 *The ACPICA documentation has been added to the public git source tree, under*  
 5139 *acpica/documents. Included are the ACPICA programmer reference, the iASL*  
 5140 *compiler reference, and the changes.txt release logfile.*

5142 Example Code and Data Size: These are the sizes for the OS-independent  
 5143 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5144 **debug version of the code includes the debug output trace mechanism and**  
 5145 **has a**  
 2018 *debug version of the code includes the debug output trace mechanism and has a*  
 5146 *much larger code and data size.*

5148 Previous Release:  
 5149 Non-Debug Version: 79.7K Code, 16.4K Data, 96.1K Total  
 5150 Debug Version: 153.9K Code, 48.4K Data, 202.3K Total  
 5151 Current Release:  
 5152 Non-Debug Version: 79.7K Code, 16.4K Data, 96.1K Total  
 5153 Debug Version: 153.7K Code, 48.2K Data, 201.9K Total

5155 2) iASL Compiler/Disassembler and Tools:

5157 Allow multiple argument counts for the predefined \_SCP method. ACPI 3.0  
 5158 defines \_SCP with 3 arguments. Previous versions defined it with only 1  
 5159 argument. iASL now allows both definitions.

5161 **iASL/disassembler: avoid infinite loop on bad ACPI tables. Check for**  
 5162 **zero-**  
 2034 *iASL/disassembler: avoid infinite loop on bad ACPI tables. Check for zero-*  
 5163 *length subtables when disassembling ACPI tables. Also fixed a couple of*  
 5164 *errors where a full 16-bit table type field was not extracted from the*  
 5165 *input*  
 2036 *errors where a full 16-bit table type field was not extracted from the input*  
 5166 *properly.*

5168 acpisrc: Improve comment counting mechanism for generating source code  
 5169 **statistics. Count first and last lines of multi-line comments as**  
 5170 **whitespace,**  
 5171 **not comment lines. Handle Linux legal header in addition to standard**  
 5172 **acpica**  
 2040 *statistics. Count first and last lines of multi-line comments as whitespace,*  
 2041 *not comment lines. Handle Linux legal header in addition to standard acpica*  
 5173 *header.*

5175 -----

5177 29 July 2008. Summary of changes for version 20080729:

5179 1) ACPI CA Core Subsystem:

5181 Fix a possible deadlock in the GPE dispatch. Remove call to  
 5182 **AcpiHwDisableAllGpes** during wake in **AcpiEvGpeDispatch**. This call will  
 5183 **attempt**  
 5184 **to acquire the GPE lock but can deadlock since the GPE lock is already**  
 5185 **held**  
 5186 **at dispatch time. This code was introduced in version 20060831 as a**  
 5187 **response**  
 2051 *AcpiHwDisableAllGpes* during wake in *AcpiEvGpeDispatch*. This call will attempt  
 2052 *to acquire the GPE lock but can deadlock since the GPE lock is already held*  
 2053 *at dispatch time. This code was introduced in version 20060831 as a response*  
 5188 *to Linux BZ 6881 and has since been removed from Linux.*

5190 **Add a function to dereference returned reference objects. Examines the**  
 5191 **return**  
 5192 **object from a call to AcpiEvaluateObject. Any Index or RefOf references**  
 5193 **are**  
 5194 **automatically dereferenced in an attempt to return something useful**  
 5195 **(these**  
 5196 **reference types cannot be converted into an external ACPI\_OBJECT.)**  
 5197 **Provides**  
 2056 *Add a function to dereference returned reference objects. Examines the return*  
 2057 *object from a call to AcpiEvaluateObject. Any Index or RefOf references are*  
 2058 *automatically dereferenced in an attempt to return something useful (these*  
 2059 *reference types cannot be converted into an external ACPI\_OBJECT.) Provides*  
 5198 *MS compatibility. Lin Ming, Bob Moore. Linux BZ 11105*

5200 x2APIC support: changes for MADT and SRAT ACPI tables. There are 2 new  
 5201 subtables for the MADT and one new subtable for the SRAT. Includes  
 5202 **disassembler and AcpiSrc support. Data from the Intel 64 Architecture**  
 5203 **x2APIC**  
 2064 *disassembler and AcpiSrc support. Data from the Intel 64 Architecture x2APIC*  
 5204 *Specification, June 2008.*

5206 **Additional error checking for pathname utilities. Add error check after**  
 5207 **all**  
 2067 *Additional error checking for pathname utilities. Add error check after all*  
 5208 *calls to AcpiNsGetPathnameLength. Add status return from*  
 5209 **AcpiNsBuildExternalPath and check after all calls. Add parameter**  
 5210 **validation**  
 2069 *AcpiNsBuildExternalPath and check after all calls. Add parameter validation*  
 5211 *to AcpiUtInitializeBuffer. Reported by and initial patch by Ingo Molnar.*

5213 **Return status from the global init function AcpiUtGlobalInitialize. This**  
 5214 **is**  
 5215 **used by both the kernel subsystem and the utilities such as iASL**  
 5216 **compiler.**  
 5217 **The function could possibly fail when the caches are initialized. Yang**  
 5218 **Yi.**  
 2072 *Return status from the global init function AcpiUtGlobalInitialize. This is*  
 2073 *used by both the kernel subsystem and the utilities such as iASL compiler.*  
 2074 *The function could possibly fail when the caches are initialized. Yang Yi.*

5220 Add a function to decode reference object types to strings. Created for  
 5221 improved error messages.

5223 **Improve object conversion error messages. Better error messages during**  
 5224 **object**  
 5225 **conversion from internal to the external ACPI\_OBJECT. Used for external**  
 5226 **calls**  
 2079 *Improve object conversion error messages. Better error messages during object*  
 2080 *conversion from internal to the external ACPI\_OBJECT. Used for external calls*  
 5227 *to AcpiEvaluateObject.*

5229 Example Code and Data Size: These are the sizes for the OS-independent

5230 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5231 **debug version of the code includes the debug output trace mechanism and**  
 5232 **has a**  
 5233 *debug version of the code includes the debug output trace mechanism and has a*  
 much larger code and data size.

5235 Previous Release:  
 5236 Non-Debug Version: 79.6K Code, 16.2K Data, 95.8K Total  
 5237 Debug Version: 153.5K Code, 48.2K Data, 201.7K Total  
 5238 Current Release:  
 5239 Non-Debug Version: 79.7K Code, 16.4K Data, 96.1K Total  
 5240 Debug Version: 153.9K Code, 48.4K Data, 202.3K Total

5242 2) iASL Compiler/Disassembler and Tools:

5244 **Debugger: fix a possible hang when evaluating non-methods. Fixes a**  
 5245 **problem**  
 5246 **introduced in version 20080701. If the object being evaluated (via**  
 5247 **execute**  
 5248 **command) is not a method, the debugger can hang while trying to obtain**  
 5249 **non-**  
 5297 *Debugger: fix a possible hang when evaluating non-methods. Fixes a problem*  
 5298 *introduced in version 20080701. If the object being evaluated (via execute*  
 5299 *command) is not a method, the debugger can hang while trying to obtain non-*  
 5250 *existent parameters.*

5252 iASL: relax error for using reserved "\_T\_x" identifiers. These names can  
 5253 appear in a disassembled ASL file if they were emitted by the original  
 5254 compiler. Instead of issuing an error or warning and forcing the user to  
 5255 manually change these names, issue a remark instead.

5257 **iASL: error if named object created in while loop. Emit an error if any**  
 5258 **named**  
 5259 **object is created within a While loop. If allowed, this code will**  
 5260 **generate**  
 5261 **a**  
 5262 **run-time error on the second iteration of the loop when an attempt is**  
 5263 **made**  
 5264 **to**  
 5297 *iASL: error if named object created in while loop. Emit an error if any named*  
 5298 *object is created within a While loop. If allowed, this code will generate a*  
 5299 *run-time error on the second iteration of the loop when an attempt is made to*  
 5265 *create the same named object twice. ACPICA bugzilla 730.*

5267 **iASL: Support absolute pathnames for include files. Add support for**  
 5268 **absolute**  
 5269 **pathnames within the Include operator. previously, only relative**  
 5270 **pathnames**  
 5297 *iASL: Support absolute pathnames for include files. Add support for absolute*  
 5298 *pathnames within the Include operator. previously, only relative pathnames*  
 5271 *were supported.*

5273 **iASL: Enforce minimum 1 interrupt in interrupt macro and Resource**  
 5274 **Descriptor.**  
 5297 *iASL: Enforce minimum 1 interrupt in interrupt macro and Resource Descriptor.*  
 5275 *The ACPI spec requires one interrupt minimum. BZ 423*

5277 iASL: Handle a missing ResourceSource arg, with a present SourceIndex.  
 5278 Handles the case for the Interrupt Resource Descriptor where  
 5279 the ResourceSource argument is omitted but ResourceSourceIndex  
 5280 is present. Now leave room for the Index. BZ 426

5282 **iASL: Prevent error message if CondRefOf target does not exist. Fixes**  
 5283 **cases**  
 5297 *iASL: Prevent error message if CondRefOf target does not exist. Fixes cases*  
 5284 *where an error message is emitted if the target does not exist. BZ 516*

5286 iASL: Fix broken -g option (get Windows ACPI tables). Fixes the -g option  
 5287 (get ACPI tables on Windows). This was apparently broken in version  
 5288 20070919.  
 5297 *(get ACPI tables on Windows). This was apparently broken in version 20070919.*

5290 **AcpiXtract: Handle EOF while extracting data. Correctly handle the case**  
 5291 **where**  
 5292 *AcpiXtract: Handle EOF while extracting data. Correctly handle the case where*  
 5292 *the EOF happens immediately after the last table in the input file. Print*  
 5293 *completion message. Previously, no message was displayed in this case.*

5295 -----  
 5296 01 July 2008. Summary of changes for version 20080701:

5298 0) Git source tree / acpica.org

5300 Fixed a problem where a git-clone from http would not transfer the entire  
 5301 source tree.

5303 1) ACPI CA Core Subsystem:

5305 Implemented a "careful" GPE disable in AcpiEvDisableGpe, only modify one  
 5306 **enable bit. Now performs a read-change-write of the enable register**  
 5307 **instead**  
 5308 **of simply writing out the cached enable mask. This will prevent**  
 5309 **inadvertent**  
 5310 **enabling of GPEs if a rogue GPE is received during initialization (before**  
 5311 **GPE**  
 5312 *enable bit. Now performs a read-change-write of the enable register instead*  
 5313 *of simply writing out the cached enable mask. This will prevent inadvertent*  
 5314 *enabling of GPEs if a rogue GPE is received during initialization (before GPE*  
 5312 *handlers are installed.)*

5314 Implemented a copy for dynamically loaded tables. Previously, dynamically  
 5315 loaded tables were simply mapped - but on some machines this memory is  
 5316 corrupted after suspend. Now copy the table to a local buffer. For the  
 5317 OpRegion case, added checksum verify. Use the table length from the table  
 5318 header, not the region length. For the Buffer case, use the table length  
 5319 also. Dennis Noordsij, Bob Moore. BZ 10734

5321 **Fixed a problem where the same ACPI table could not be dynamically loaded**  
 5322 **and**  
 5323 **unloaded more than once. Without this change, a table cannot be loaded**  
 5324 **again**  
 5325 *Fixed a problem where the same ACPI table could not be dynamically loaded and*  
 5326 *unloaded more than once. Without this change, a table cannot be loaded again*  
 5325 *once it has been loaded/unloaded one time. The current mechanism does not*  
 5326 **unregister a table upon an unload. During a load, if the same table is**  
 5327 **found,**  
 5328 *unregister a table upon an unload. During a load, if the same table is found,*  
 5328 *this no longer returns an exception. BZ 722*

5330 Fixed a problem where the wrong descriptor length was calculated for the  
 5331 **EndTag descriptor in 64-bit mode. The "minimal" descriptors such as**  
 5332 **EndTag**  
 5333 *EndTag descriptor in 64-bit mode. The "minimal" descriptors such as EndTag*  
 5333 *are calculated as 12 bytes long, but the actual length in the internal*  
 5334 **descriptor is 16 because of the round-up to 8 on the 64-bit build.**  
 5335 **Reported**  
 5336 *descriptor is 16 because of the round-up to 8 on the 64-bit build. Reported*  
 5336 *by Linn Crosetto. BZ 728*

5338 **Fixed a possible memory leak in the Unload operator. The DdbHandle**  
 5339 **returned**  
 5340 **by Load() did not have its reference count decremented during unload,**

5341 **leading**  
 2169 *Fixed a possible memory leak in the Unload operator. The DdbHandle returned*  
 2170 *by Load() did not have its reference count decremented during unload, leading*  
 5342 *to a memory leak. Lin Ming. BZ 727*

5344 Fixed a possible memory leak when deleting thermal/processor objects. Any  
 5345 associated notify handlers (and objects) were not being deleted. Fiodor  
 5346 Suietov. BZ 506

5348 **Fixed the ordering of the ASCII names in the global mutex table to match**  
 5349 **the**  
 5350 **actual mutex IDs. Used by AcpiUtGetMutexName, a function used for debug**  
 5351 **only.**  
 2177 *Fixed the ordering of the ASCII names in the global mutex table to match the*  
 2178 *actual mutex IDs. Used by AcpiUtGetMutexName, a function used for debug only.*  
 5352 Vegard Nossun. BZ 726

5354 Enhanced the AcpiGetObjectInfo interface to return the number of required  
 5355 **arguments if the object is a control method. Added this call to the**  
 5356 **debugger**  
 2182 *arguments if the object is a control method. Added this call to the debugger*  
 5357 *so the proper number of default arguments are passed to a method. This*  
 5358 *prevents a warning when executing methods from AcpiExec.*

5360 Added a check for an invalid handle in AcpiGetObjectInfo. Return  
 5361 AE\_BAD\_PARAMETER if input handle is invalid. BZ 474

5363 Fixed an extraneous warning from exconfig.c on the 64-bit build.

5365 Example Code and Data Size: These are the sizes for the OS-independent  
 5366 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5367 **debug version of the code includes the debug output trace mechanism and**  
 5368 **has a**  
 2193 *debug version of the code includes the debug output trace mechanism and has a*  
 5369 *much larger code and data size.*

5371	Previous Release:	
5372	Non-Debug Version:	79.3K Code, 16.2K Data, 95.5K Total
5373	Debug Version:	153.0K Code, 48.2K Data, 201.2K Total
5374	Current Release:	
5375	Non-Debug Version:	79.6K Code, 16.2K Data, 95.8K Total
5376	Debug Version:	153.5K Code, 48.2K Data, 201.7K Total

5378 2) iASL Compiler/Disassembler and Tools:

5380 iASL: Added two missing ACPI reserved names. Added \_MTP and \_ASZ, both  
 5381 resource descriptor names.

5383 **iASL: Detect invalid ASCII characters in input (windows version). Removed**  
 5384 **the**  
 2208 *iASL: Detect invalid ASCII characters in input (windows version). Removed the*  
 5385 *"-CF" flag from the flex compile, enables correct detection of non-ASCII*  
 5386 *characters in the input. BZ 441*

5388 **iASL: Eliminate warning when result of LoadTable is not used. Eliminate**  
 5389 **the**  
 2212 *iASL: Eliminate warning when result of LoadTable is not used. Eliminate the*  
 5390 *"result of operation not used" warning when the DDB handle returned from*  
 5391 *LoadTable is not used. The warning is not needed. BZ 590*

5393 **AcpiExec: Add support for dynamic table load/unload. Now calls \_CFG**  
 5394 **method**  
 5395 **to**  
 5396 **pass address of table to the AML. Added option to disable OpRegion**  
 5397 **simulation**  
 5398 **to allow creation of an OpRegion with a real address that was passed to**

5399 **\_CFG.**  
 5400 **All of this allows testing of the Load and Unload operators from**  
 5401 **AcpiExec.**  
 2216 *AcpiExec: Add support for dynamic table load/unload. Now calls \_CFG method to*  
 2217 *pass address of table to the AML. Added option to disable OpRegion simulation*  
 2218 *to allow creation of an OpRegion with a real address that was passed to \_CFG.*  
 2219 *All of this allows testing of the Load and Unload operators from AcpiExec.*

5403 **Debugger: update tables command for unloaded tables. Handle unloaded**  
 5404 **tables**  
 2221 *Debugger: update tables command for unloaded tables. Handle unloaded tables*  
 5405 *and use the standard table header output routine.*

5407 -----  
 5408 09 June 2008. Summary of changes for version 20080609:

5410 1) ACPI CA Core Subsystem:

5412 **Implemented a workaround for reversed \_PRT entries. A significant number**  
 5413 **of**  
 2229 *Implemented a workaround for reversed \_PRT entries. A significant number of*  
 5414 *BIOSs erroneously reverse the \_PRT SourceName and the SourceIndex. This*  
 5415 **change dynamically detects and repairs this problem. Provides**  
 5416 **compatibility**  
 2231 *change dynamically detects and repairs this problem. Provides compatibility*  
 5417 *with MS ACPI. BZ 6859*

5419 Simplified the internal ACPI hardware interfaces to eliminate the locking  
 5420 flag parameter from Register Read/Write. Added a new external interface,  
 5421 AcpiGetRegisterUnlocked.

5423 **Fixed a problem where the invocation of a GPE control method could hang.**  
 5424 **This**  
 2238 *Fixed a problem where the invocation of a GPE control method could hang. This*  
 5425 *was a regression introduced in 20080514. The new method argument count*  
 5426 *validation mechanism can enter an infinite loop when a GPE method is*  
 5427 **dispatched. Problem fixed by removing the obsolete code that passed GPE**  
 5428 **block**  
 5429 **information to the notify handler via the control method parameter**  
 5430 **pointer.**  
 2241 *dispatched. Problem fixed by removing the obsolete code that passed GPE block*  
 2242 *information to the notify handler via the control method parameter pointer.*

5432 **Fixed a problem where the \_SST execution status was incorrectly returned**  
 5433 **to**  
 5434 **the caller of AcpiEnterSleepStatePrep. This was a regression introduced**  
 5435 **in**  
 2244 *Fixed a problem where the \_SST execution status was incorrectly returned to*  
 2245 *the caller of AcpiEnterSleepStatePrep. This was a regression introduced in*  
 5436 *20080514. \_SST is optional and a NOT\_FOUND exception should never be*  
 5437 *returned. BZ 716*

5439 **Fixed a problem where a deleted object could be accessed from within the**  
 5440 **AML**  
 5441 **parser. This was a regression introduced in version 20080123 as a fix for**  
 5442 **the**  
 2249 *Fixed a problem where a deleted object could be accessed from within the AML*  
 2250 *parser. This was a regression introduced in version 20080123 as a fix for the*  
 5443 *Unload operator. Lin Ming. BZ 10669*

5445 **Cleaned up the debug operand dump mechanism. Eliminated unnecessary**  
 5446 **operands**  
 2253 *Cleaned up the debug operand dump mechanism. Eliminated unnecessary operands*  
 5447 *and eliminated the use of a negative index in a loop. Operands are now*  
 5448 **displayed in the correct order, not backwards. This also fixes a**  
 5449 **regression**

2255 displayed in the correct order, not backwards. This also fixes a regression  
5450 introduced in 20080514 on 64-bit systems where the elimination of  
5451 **ACPI\_NATIVE\_UINT caused the negative index to go large and positive. BZ**  
5452 **715**  
2257 *ACPI\_NATIVE\_UINT caused the negative index to go large and positive. BZ 715*

5454 **Fixed a possible memory leak in EvPciConfigRegionSetup where the error**  
5455 **exit**  
2259 *Fixed a possible memory leak in EvPciConfigRegionSetup where the error exit*  
5456 *path did not delete a locally allocated structure.*

5458 Updated definitions for the DMAR and SRAT tables to synchronize with the  
5459 current specifications. Includes disassembler support.

5461 Fixed a problem in the mutex debug code (in utmutex.c) where an incorrect  
5462 **loop termination value was used. Loop terminated on iteration early,**  
5463 **missing**  
2266 *loop termination value was used. Loop terminated on iteration early, missing*  
5464 *one mutex. Linn Crosetto*

5466 Example Code and Data Size: These are the sizes for the OS-independent  
5467 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
5468 **debug version of the code includes the debug output trace mechanism and**  
5469 **has a**  
2271 *debug version of the code includes the debug output trace mechanism and has a*  
5470 *much larger code and data size.*

5472 Previous Release:  
5473 Non-Debug Version: 79.5K Code, 16.2K Data, 95.7K Total  
5474 Debug Version: 153.3K Code, 48.3K Data, 201.6K Total  
5475 Current Release:  
5476 Non-Debug Version: 79.3K Code, 16.2K Data, 95.5K Total  
5477 Debug Version: 153.0K Code, 48.2K Data, 201.2K Total

5479 2) iASL Compiler/Disassembler and Tools:

5481 Disassembler: Implemented support for EisaId() within \_CID objects. Now  
5482 disassemble integer \_CID objects back to EisaId invocations, including  
5483 multiple integers within \_CID packages. Includes single-step support for  
5484 debugger also.

5486 Disassembler: Added support for DMAR and SRAT table definition changes.

5488 -----  
5489 14 May 2008. Summary of changes for version 20080514:

5491 1) ACPI CA Core Subsystem:

5493 Fixed a problem where GPEs were enabled too early during the ACPICA  
5494 initialization. This could lead to "handler not installed" errors on some  
5495 **machines. Moved GPE enable until after \_REG/\_STA/\_INI methods are run.**  
5496 **This**  
5497 **ensures that all operation regions and devices throughout the namespace**  
5498 **have**  
2297 *machines. Moved GPE enable until after \_REG/\_STA/\_INI methods are run. This*  
2298 *ensures that all operation regions and devices throughout the namespace have*  
5499 *been initialized before GPEs are enabled. Alexey Starikovskiy, BZ 9916.*

5501 Implemented a change to the enter sleep code. Moved execution of the \_GTS  
5502 **method to just before setting sleep enable bit. The execution was moved**  
5503 **from**  
2302 *method to just before setting sleep enable bit. The execution was moved from*  
5504 *AcpiEnterSleepStatePrep to AcpiEnterSleepState. \_GTS is now executed*  
5505 *immediately before the SLP\_EN bit is set, as per the ACPI specification.*  
5506 *Luming Yu, BZ 1653.*

5508 **Implemented a fix to disable unknown GPEs (2nd version). Now always**  
5509 **disable**  
2307 *Implemented a fix to disable unknown GPEs (2nd version). Now always disable*  
5510 *the GPE, even if ACPICA thinks that that it is already disabled. It is*  
5511 **possible that the AML or some other code has enabled the GPE unbeknownst**  
5512 **to**  
2309 *possible that the AML or some other code has enabled the GPE unbeknownst to*  
5513 *the ACPICA code.*

5515 **Fixed a problem with the Field operator where zero-length fields would**  
5516 **return**  
5517 **an AE\_AML\_NO\_OPERAND exception during table load. Fix enables zero-length**  
5518 **ASL**  
2312 *Fixed a problem with the Field operator where zero-length fields would return*  
2313 *an AE\_AML\_NO\_OPERAND exception during table load. Fix enables zero-length ASL*  
5519 *field declarations in Field(), BankField(), and IndexField(). BZ 10606.*

5521 **Implemented a fix for the Load operator, now load the table at the**  
5522 **namespace**  
5523 **root. This reverts a change introduced in version 20071019. The table is**  
5524 **now**  
2316 *Implemented a fix for the Load operator, now load the table at the namespace*  
2317 *root. This reverts a change introduced in version 20071019. The table is now*  
5525 *loaded at the namespace root even though this goes against the ACPI*  
5526 **specification. This provides compatibility with other ACPI**  
5527 **implementations.**  
5528 **The ACPI specification will be updated to reflect this in ACPI 4.0. Lin**  
5529 **Ming.**  
2319 *specification. This provides compatibility with other ACPI implementations.*  
2320 *The ACPI specification will be updated to reflect this in ACPI 4.0. Lin Ming.*

5531 **Fixed a problem where ACPICA would not Load() tables with unusual**  
5532 **signatures.**  
2322 *Fixed a problem where ACPICA would not Load() tables with unusual signatures.*  
5533 *Now ignore ACPI table signature for Load() operator. Only "SSDT" is*  
5534 *acceptable to the ACPI spec, but tables are seen with OEMx and null sigs.*  
5535 **Therefore, signature validation is worthless. Apparently MS ACPI accepts**  
5536 **such**  
2325 *Therefore, signature validation is worthless. Apparently MS ACPI accepts such*  
5537 *signatures, ACPICA must be compatible. BZ 10454.*

5539 **Fixed a possible negative array index in AcpiUtValidateException. Added**  
5540 **NULL**  
5541 **fields to the exception string arrays to eliminate a -1 subtraction on**  
5542 **the**  
2328 *Fixed a possible negative array index in AcpiUtValidateException. Added NULL*  
2329 *fields to the exception string arrays to eliminate a -1 subtraction on the*  
5543 *SubStatus field.*

5545 Updated the debug tracking macros to reduce overall code and data size.  
5546 Changed ACPI\_MODULE\_NAME and ACPI\_FUNCTION\_NAME to use arrays of strings  
5547 instead of pointers to static strings. Jan Beulich and Bob Moore.

5549 Implemented argument count checking in control method invocation via  
5550 **AcpiEvaluateObject. Now emit an error if too few arguments, warning if**  
5551 **too**  
5552 **many. This applies only to extern programmatic control method execution,**  
5553 **not**  
2337 *AcpiEvaluateObject. Now emit an error if too few arguments, warning if too*  
2338 *many. This applies only to extern programmatic control method execution, not*  
5554 *method-to-method calls within the AML. Lin Ming.*

5556 **Eliminated the ACPI\_NATIVE\_UINT type across all ACPICA code. This type is**  
5557 **no**  
5558 **longer needed, especially with the removal of 16-bit support. It was**  
5559 **replaced**

5560 mostly with UINT32, but also ACPI\_SIZE where a type that changes 32/64  
 5561 bit  
 5562 on  
 2341 Eliminated the ACPI\_NATIVE\_UINT type across all ACPICA code. This type is no  
 2342 longer needed, especially with the removal of 16-bit support. It was replaced  
 2343 mostly with UINT32, but also ACPI\_SIZE where a type that changes 32/64 bit on  
 5563 32/64-bit platforms is required.

5565 Added the C const qualifier for appropriate string constants -- mostly  
 5566 MODULE\_NAME and printf format strings. Jan Beulich.

5568 Example Code and Data Size: These are the sizes for the OS-independent  
 5569 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5570 debug version of the code includes the debug output trace mechanism and  
 5571 has a  
 2351 debug version of the code includes the debug output trace mechanism and has a  
 5572 much larger code and data size.

5574 Previous Release:  
 5575 Non-Debug Version: 80.0K Code, 17.4K Data, 97.4K Total  
 5576 Debug Version: 159.4K Code, 64.4K Data, 223.8K Total  
 5577 Current Release:  
 5578 Non-Debug Version: 79.5K Code, 16.2K Data, 95.7K Total  
 5579 Debug Version: 153.3K Code, 48.3K Data, 201.6K Total

5581 2) iASL Compiler/Disassembler and Tools:

5583 Implemented ACPI table revision ID validation in the disassembler. Zero  
 5584 is  
 5585 always invalid. For DSDTs, the ID controls the interpreter integer width.  
 5586 1  
 2363 Implemented ACPI table revision ID validation in the disassembler. Zero is  
 2364 always invalid. For DSDTs, the ID controls the interpreter integer width. 1  
 5587 means 32-bit and this is unusual. 2 or greater is 64-bit.

5589 -----  
 5590 21 March 2008. Summary of changes for version 20080321:

5592 1) ACPI CA Core Subsystem:

5594 Implemented an additional change to the GPE support in order to suppress  
 5595 spurious or stray GPEs. The AcpiEvDisableGpe function will now  
 5596 permanently  
 5597 disable incoming GPEs that are neither enabled nor disabled -- meaning  
 5598 that  
 5599 the GPE is unknown to the system. This should prevent future interrupt  
 5600 floods  
 2373 spurious or stray GPEs. The AcpiEvDisableGpe function will now permanently  
 2374 disable incoming GPEs that are neither enabled nor disabled -- meaning that  
 2375 the GPE is unknown to the system. This should prevent future interrupt floods  
 5601 from that GPE. BZ 6217 (Zhang Rui)

5603 Fixed a problem where NULL package elements were not returned to the  
 5604 AcpiEvaluateObject interface correctly. The element was simply ignored  
 5605 instead of returning a NULL ACPI\_OBJECT package element, potentially  
 5606 causing  
 5607 a buffer overflow and/or confusing the caller who expected a fixed number  
 5608 of  
 2380 instead of returning a NULL ACPI\_OBJECT package element, potentially causing  
 2381 a buffer overflow and/or confusing the caller who expected a fixed number of  
 5609 elements. BZ 10132 (Lin Ming, Bob Moore)

5611 Fixed a problem with the CreateField, CreateXXXXField (Bit, Byte, Word,  
 5612 Dword,  
 5613 Qword), Field, BankField, and IndexField operators when invoked from  
 5614 inside

5615 an executing control method. In this case, these operators created  
 5616 namespace  
 2384 Fixed a problem with the CreateField, CreateXXXXField (Bit, Byte, Word, Dword,  
 2385 Qword), Field, BankField, and IndexField operators when invoked from inside  
 2386 an executing control method. In this case, these operators created namespace  
 5617 nodes that were incorrectly left marked as permanent nodes instead of  
 5618 temporary nodes. This could cause a problem if there is race condition  
 5619 between an exiting control method and a running namespace walk. (Reported  
 5620 by  
 2389 between an exiting control method and a running namespace walk. (Reported by  
 5621 Linn Crosetto)

5623 Fixed a problem where the CreateField and CreateXXXXField operators would  
 5624 incorrectly allow duplicate names (the name of the field) with no  
 5625 exception  
 2393 incorrectly allow duplicate names (the name of the field) with no exception  
 5626 generated.

5628 Implemented several changes for Notify handling. Added support for new  
 5629 Notify  
 2396 Implemented several changes for Notify handling. Added support for new Notify  
 5630 values (ACPI 2.0+) and improved the Notify debug output. Notify on  
 5631 PowerResource objects is no longer allowed, as per the ACPI  
 5632 specification.  
 2398 PowerResource objects is no longer allowed, as per the ACPI specification.  
 5633 (Bob Moore, Zhang Rui)

5635 All Reference Objects returned via the AcpiEvaluateObject interface are  
 5636 now  
 5637 marked as type "REFERENCE" instead of "ANY". The type ANY is now reserved  
 5638 for  
 5639 NULL objects - either NULL package elements or unresolved named  
 5640 references.  
 2401 All Reference Objects returned via the AcpiEvaluateObject interface are now  
 2402 marked as type "REFERENCE" instead of "ANY". The type ANY is now reserved for  
 2403 NULL objects - either NULL package elements or unresolved named references.

5642 Fixed a problem where an extraneous debug message was produced for  
 5643 package  
 2405 Fixed a problem where an extraneous debug message was produced for package  
 5644 objects (when debugging enabled). The message "Package List length larger  
 5645 than NumElements count" is now produced in the correct case, and is now  
 5646 an  
 2407 than NumElements count" is now produced in the correct case, and is now an  
 5647 error message rather than a debug message. Added a debug message for the  
 5648 opposite case, where NumElements is larger than the Package List (the  
 5649 package  
 2409 opposite case, where NumElements is larger than the Package List (the package  
 5650 will be padded out with NULL elements as per the ACPI spec.)

5652 Implemented several improvements for the output of the ASL "Debug" object  
 5653 to  
 2412 Implemented several improvements for the output of the ASL "Debug" object to  
 5654 clarify and keep all data for a given object on one output line.

5656 Fixed two size calculation issues with the variable-length Start  
 5657 Dependent  
 2415 Fixed two size calculation issues with the variable-length Start Dependent  
 5658 resource descriptor.

5660 Example Code and Data Size: These are the sizes for the OS-independent  
 5661 apica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5662 debug version of the code includes the debug output trace mechanism and  
 5663 has  
 2420 debug version of the code includes the debug output trace mechanism and has  
 5664 a much larger code and data size.

5666 Previous Release:  
 5667 Non-Debug Version: 79.7K Code, 17.3K Data, 97.0K Total  
 5668 Debug Version: 158.9K Code, 64.0K Data, 222.9K Total  
 5669 Current Release:  
 5670 Non-Debug Version: 80.0K Code, 17.4K Data, 97.4K Total  
 5671 Debug Version: 159.4K Code, 64.4K Data, 223.8K Total

5673 2) iASL Compiler/Disassembler and Tools:

5675 **Fixed a problem with the use of the Switch operator where execution of**  
 5676 **the**  
 2432 *Fixed a problem with the use of the Switch operator where execution of the*  
 5677 *containing method by multiple concurrent threads could cause an*  
 5678 *AE\_ALREADY\_EXISTS exception. This is caused by the fact that there is no*  
 5679 *actual Switch opcode, it must be simulated with local named temporary*  
 5680 **variables and if/else pairs. The solution chosen was to mark any method**  
 5681 **that**  
 5682 **uses Switch as Serialized, thus preventing multiple thread entries. BZ**  
 5683 **469.**  
 2436 *variables and if/else pairs. The solution chosen was to mark any method that*  
 2437 *uses Switch as Serialized, thus preventing multiple thread entries. BZ 469.*

5685 -----  
 5686 13 February 2008. Summary of changes for version 20080213:

5688 1) ACPI CA Core Subsystem:

5690 **Implemented another MS compatibility design change for GPE/Notify**  
 5691 **handling.**  
 5692 **GPEs are now cleared/enabled asynchronously to allow all pending notifies**  
 5693 **to**  
 2444 *Implemented another MS compatibility design change for GPE/Notify handling.*  
 2445 *GPEs are now cleared/enabled asynchronously to allow all pending notifies to*  
 5694 *complete first. It is expected that the OSL will queue the enable request*  
 5695 **behind all pending notify requests (may require changes to the local host**  
 5696 **OSL**  
 2447 *behind all pending notify requests (may require changes to the local host OSL*  
 5697 *in AcpiOsExecute). Alexey Starikovskiy.*

5699 Fixed a problem where buffer and package objects passed as arguments to a  
 5700 **control method via the external AcpiEvaluateObject interface could cause**  
 5701 **an**  
 2451 *control method via the external AcpiEvaluateObject interface could cause an*  
 5702 *AE\_AML\_INTERNAL exception depending on the order and type of operators*  
 5703 *executed by the target control method.*

5705 Fixed a problem where resource descriptor size optimization could cause a  
 5706 **problem when a \_CRS resource template is passed to a \_SRS method. The**  
 5707 **\_SRS**  
 2456 *problem when a \_CRS resource template is passed to a \_SRS method. The \_SRS*  
 5708 *resource template must use the same descriptors (with the same size) as*  
 5709 **returned from \_CRS. This change affects the following resource**  
 5710 **descriptors:**  
 5711 **IRQ / IRQNoFlags and StartDependentFn / StartDependentFnNoPri. (BZ**  
 5712 **9487)**  
 2458 *returned from \_CRS. This change affects the following resource descriptors:*  
 2459 *IRQ / IRQNoFlags and StartDependentFn / StartDependentFnNoPri. (BZ 9487)*

5714 **Fixed a problem where a CopyObject to RegionField, BankField, and**  
 5715 **IndexField**  
 5716 **objects did not perform an implicit conversion as it should. These types**  
 5717 **must**  
 5718 **retain their initial type permanently as per the ACPI specification.**  
 5719 **However,**  
 2461 *Fixed a problem where a CopyObject to RegionField, BankField, and IndexField*

2462 *objects did not perform an implicit conversion as it should. These types must*  
 2463 *retain their initial type permanently as per the ACPI specification. However,*  
 5720 *a CopyObject to all other object types should not perform an implicit*  
 5721 *conversion, as per the ACPI specification. (Lin Ming, Bob Moore) BZ 388*

5723 Fixed a problem with the AcpiGetDevices interface where the mechanism to  
 5724 match device CIDs did not examine the entire list of available CIDs, but  
 5725 instead aborted on the first non-matching CID. Andrew Patterson.

5727 **Fixed a regression introduced in version 20071114. The ACPI\_HIDWORD macro**  
 5728 **was**  
 2471 *Fixed a regression introduced in version 20071114. The ACPI\_HIDWORD macro was*  
 5729 *inadvertently changed to return a 16-bit value instead of a 32-bit value,*  
 5730 *truncating the upper dword of a 64-bit value. This macro is only used to*  
 5731 *display debug output, so no incorrect calculations were made. Also,*  
 5732 *reimplemented the macro so that a 64-bit shift is not performed by*  
 5733 *inefficient compilers.*

5735 Added missing va\_end statements that should correspond with each va\_start  
 5736 statement.

5738 Example Code and Data Size: These are the sizes for the OS-independent  
 5739 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5740 **debug version of the code includes the debug output trace mechanism and**  
 5741 **has**  
 2483 *debug version of the code includes the debug output trace mechanism and has*  
 5742 *a much larger code and data size.*

5744 Previous Release:  
 5745 Non-Debug Version: 79.5K Code, 17.2K Data, 96.7K Total  
 5746 Debug Version: 159.0K Code, 63.8K Data, 222.8K Total  
 5747 Current Release:  
 5748 Non-Debug Version: 79.7K Code, 17.3K Data, 97.0K Total  
 5749 Debug Version: 158.9K Code, 64.0K Data, 222.9K Total

5751 2) iASL Compiler/Disassembler and Tools:

5753 Implemented full disassembler support for the following new ACPI tables:  
 5754 BERT, EINJ, and ERST. Implemented partial disassembler support for the  
 5755 complicated HEST table. These tables support the Windows Hardware Error  
 5756 Architecture (WHEA).

5758 -----  
 5759 23 January 2008. Summary of changes for version 20080123:

5761 1) ACPI CA Core Subsystem:

5763 Added the 2008 copyright to all module headers and signons. This affects  
 5764 virtually every file in the ACPICA core subsystem, the iASL compiler, and  
 5765 the tools/utilities.

5767 **Fixed a problem with the SizeOf operator when used with Package and**  
 5768 **Buffer**  
 5769 **objects. These objects have deferred execution for some arguments, and**  
 5770 **the**  
 5771 **execution is now completed before the SizeOf is executed. This problem**  
 5772 **caused**  
 5773 **unexpected AE\_PACKAGE\_LIMIT errors on some systems (Lin Ming, Bob Moore)**  
 5774 **BZ**  
 2509 *Fixed a problem with the SizeOf operator when used with Package and Buffer*  
 2510 *objects. These objects have deferred execution for some arguments, and the*  
 2511 *execution is now completed before the SizeOf is executed. This problem caused*  
 2512 *unexpected AE\_PACKAGE\_LIMIT errors on some systems (Lin Ming, Bob Moore) BZ*  
 5775 *9558*

5777 **Implemented an enhancement to the interpreter "slack mode". In the**

5778 **absence**  
 5779 **of**  
 5780 **an explicit return or an implicitly returned object from the last**  
 5781 **executed**  
 5782 **opcode, a control method will now implicitly return an integer of value 0**  
 5783 **for**  
 2515 *Implemented an enhancement to the interpreter "slack mode". In the absence of*  
 2516 *an explicit return or an implicitly returned object from the last executed*  
 2517 *opcode, a control method will now implicitly return an integer of value 0 for*  
 5784 *Microsoft compatibility. (Lin Ming) BZ 392*

5786 **Fixed a problem with the Load operator where an exception was not**  
 5787 **returned**  
 5788 **in**  
 2520 *Fixed a problem with the Load operator where an exception was not returned in*  
 5789 *the case where the table is already loaded. (Lin Ming) BZ 463*

5791 **Implemented support for the use of DDBHandles as an Indexed Reference, as**  
 5792 **per**  
 2523 *Implemented support for the use of DDBHandles as an Indexed Reference, as per*  
 5793 *the ACPI spec. (Lin Ming) BZ 486*

5795 **Implemented support for UserTerm (Method invocation) for the Unload**  
 5796 **operator**  
 2526 *Implemented support for UserTerm (Method invocation) for the Unload operator*  
 5797 *as per the ACPI spec. (Lin Ming) BZ 580*

5799 **Fixed a problem with the LoadTable operator where the OemId and**  
 5800 **OemTableId**  
 5801 **input strings could cause unexpected failures if they were shorter than**  
 5802 **the**  
 2529 *Fixed a problem with the LoadTable operator where the OemId and OemTableId*  
 2530 *input strings could cause unexpected failures if they were shorter than the*  
 5803 *maximum lengths allowed. (Lin Ming, Bob Moore) BZ 576*

5805 **Implemented support for UserTerm (Method invocation) for the Unload**  
 5806 **operator**  
 2533 *Implemented support for UserTerm (Method invocation) for the Unload operator*  
 5807 *as per the ACPI spec. (Lin Ming) BZ 580*

5809 **Implemented header file support for new ACPI tables - BERT, ERST, EINJ,**  
 5810 **HEST,**  
 2536 *Implemented header file support for new ACPI tables - BERT, ERST, EINJ, HEST,*  
 5811 *IBFT, UEFI, WDAT. Disassembler support is forthcoming.*

5813 **Example Code and Data Size: These are the sizes for the OS-independent**  
 5814 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The**  
 5815 **debug version of the code includes the debug output trace mechanism and**  
 5816 **has**  
 2541 *debug version of the code includes the debug output trace mechanism and has*  
 5817 *a much larger code and data size.*

5819 **Previous Release:**  
 5820 **Non-Debug Version: 79.3K Code, 17.2K Data, 96.5K Total**  
 5821 **Debug Version: 158.6K Code, 63.8K Data, 222.4K Total**  
 5822 **Current Release:**  
 5823 **Non-Debug Version: 79.5K Code, 17.2K Data, 96.7K Total**  
 5824 **Debug Version: 159.0K Code, 63.8K Data, 222.8K Total**

5826 **2) iASL Compiler/Disassembler and Tools:**

5828 **Implemented support in the disassembler for checksum validation on**  
 5829 **incoming**  
 5830 **binary DSDTs and SSDTs. If incorrect, a message is displayed within the**  
 5831 **table**  
 2553 *Implemented support in the disassembler for checksum validation on incoming*

2554 *binary DSDTs and SSDTs. If incorrect, a message is displayed within the table*  
 5832 *header dump at the start of the disassembly.*

5834 **Implemented additional debugging information in the namespace listing**  
 5835 **file**  
 5836 **created during compilation. In addition to the namespace hierarchy, the**  
 5837 **full**  
 2557 *Implemented additional debugging information in the namespace listing file*  
 2558 *created during compilation. In addition to the namespace hierarchy, the full*  
 5838 *pathname to each namespace object is displayed.*

5840 **Fixed a problem with the disassembler where invalid ACPI tables could**  
 5841 **cause**  
 2561 *Fixed a problem with the disassembler where invalid ACPI tables could cause*  
 5842 *faults or infinite loops.*

5844 **Fixed an unexpected parse error when using the optional "parameter types"**  
 5845 **list in a control method declaration. (Lin Ming) BZ 397**

5847 **Fixed a problem where two External declarations with the same name did**  
 5848 **not**  
 2567 *Fixed a problem where two External declarations with the same name did not*  
 5849 *cause an error (Lin Ming) BZ 509*

5851 **Implemented support for full TermArgs (adding Argx, Localx and method**  
 5852 **invocation) for the ParameterData parameter to the LoadTable operator.**  
 5853 **(Lin**  
 2571 *invocation) for the ParameterData parameter to the LoadTable operator. (Lin*  
 5854 *Ming) BZ 583,587*

5856 -----  
 5857 19 December 2007. Summary of changes for version 20071219:

5859 **1) ACPI CA Core Subsystem:**

5861 **Implemented full support for deferred execution for the TermArg string**  
 5862 **arguments for DataTableRegion. This enables forward references and full**  
 5863 **operand resolution for the three string arguments. Similar to**  
 5864 **OperationRegion**  
 2581 *operand resolution for the three string arguments. Similar to OperationRegion*  
 5865 *deferred argument execution.) Lin Ming. BZ 430*

5867 **Implemented full argument resolution support for the BankValue argument**  
 5868 **to**  
 5869 **BankField. Previously, only constants were supported, now any TermArg may**  
 5870 **be**  
 2584 *Implemented full argument resolution support for the BankValue argument to*  
 2585 *BankField. Previously, only constants were supported, now any TermArg may be*  
 5871 *used. Lin Ming BZ 387, 393*

5873 **Fixed a problem with AcpiGetDevices where the search of a branch of the**  
 5874 **device tree could be terminated prematurely. In accordance with the ACPI**  
 5875 **specification, the search down the current branch is terminated if a**  
 5876 **device**  
 5877 **is both not present and not functional (instead of just not present.)**  
 5878 **Yakui**  
 2590 *specification, the search down the current branch is terminated if a device*  
 2591 *is both not present and not functional (instead of just not present.) Yakui*  
 5879 *Zhao.*

5881 **Fixed a problem where "unknown" GPEs could be allowed to fire repeatedly**  
 5882 **if**  
 5883 **the underlying AML code changed the GPE enable registers. Now, any**  
 5884 **unknown**  
 5885 **incoming GPE (no \_Lxx/\_Exx method and not the EC GPE) is immediately**  
 5886 **disabled**

2594 Fixed a problem where "unknown" GPEs could be allowed to fire repeatedly if  
 2595 the underlying AML code changed the GPE enable registers. Now, any unknown  
 2596 incoming GPE (no `_Lxx/_Exx` method and not the EC GPE) is immediately disabled  
 5887 instead of simply ignored. Rui Zhang.

5889 Fixed a problem with Index Fields where the Index register was  
 5890 incorrectly  
 2599 Fixed a problem with Index Fields where the Index register was incorrectly  
 5891 limited to a maximum of 32 bits. Now any size may be used.

5893 Fixed a couple memory leaks associated with "implicit return" objects  
 5894 when  
 2602 Fixed a couple memory leaks associated with "implicit return" objects when  
 5895 the AML Interpreter slack mode is enabled. Lin Ming BZ 349

5897 Example Code and Data Size: These are the sizes for the OS-independent  
 5898 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5899 debug version of the code includes the debug output trace mechanism and  
 5900 has  
 2607 debug version of the code includes the debug output trace mechanism and has  
 5901 a much larger code and data size.

5903 Previous Release:  
 5904 Non-Debug Version: 79.0K Code, 17.2K Data, 96.2K Total  
 5905 Debug Version: 157.9K Code, 63.6K Data, 221.5K Total  
 5906 Current Release:  
 5907 Non-Debug Version: 79.3K Code, 17.2K Data, 96.5K Total  
 5908 Debug Version: 158.6K Code, 63.8K Data, 222.4K Total

5910 -----  
 5911 14 November 2007. Summary of changes for version 20071114:

5913 1) ACPI CA Core Subsystem:

5915 Implemented event counters for each of the Fixed Events, the ACPI SCI  
 5916 (interrupt) itself, and control methods executed. Named  
 5917 `AcpiFixedEventCount[]`, `AcpiSciCount`, and `AcpiMethodCount` respectively.  
 5918 These  
 2624 `AcpiFixedEventCount[]`, `AcpiSciCount`, and `AcpiMethodCount` respectively. These  
 5919 should be useful for debugging and statistics.

5921 Implemented a new external interface, `AcpiGetStatistics`, to retrieve the  
 5922 contents of the various event counters. Returns the current values for  
 5923 `AcpiSciCount`, `AcpiGpeCount`, the `AcpiFixedEventCount` array, and  
 5924 `AcpiMethodCount`. The interface can be expanded in the future if new  
 5925 counters  
 5926 are added. Device drivers should use this interface rather than access  
 5927 the  
 2630 `AcpiMethodCount`. The interface can be expanded in the future if new counters  
 2631 are added. Device drivers should use this interface rather than access the  
 5928 counters directly.

5930 Fixed a problem with the `FromBCD` and `ToBCD` operators. With some  
 5931 compilers,  
 5932 the `ShortDivide` function worked incorrectly, causing problems with the  
 5933 BCD  
 2634 Fixed a problem with the `FromBCD` and `ToBCD` operators. With some compilers,  
 2635 the `ShortDivide` function worked incorrectly, causing problems with the BCD  
 5934 functions with large input values. A truncation from 64-bit to 32-bit  
 5935 inadvertently occurred. Internal BZ 435. Lin Ming

5937 Fixed a problem with Index references passed as method arguments.  
 5938 References  
 5939 passed as arguments to control methods were dereferenced immediately  
 5940 (before  
 5941 control was passed to the called method). The references are now

5942 correctly  
 2639 Fixed a problem with Index references passed as method arguments. References  
 2640 passed as arguments to control methods were dereferenced immediately (before  
 2641 control was passed to the called method). The references are now correctly  
 5943 passed directly to the called method. BZ 5389. Lin Ming

5945 Fixed a problem with `CopyObject` used in conjunction with the Index  
 5946 operator.  
 5947 The reference was incorrectly dereferenced before the copy. The reference  
 5948 is  
 2644 Fixed a problem with `CopyObject` used in conjunction with the Index operator.  
 2645 The reference was incorrectly dereferenced before the copy. The reference is  
 5949 now correctly copied. BZ 5391. Lin Ming

5951 Fixed a problem with Control Method references within Package objects.  
 5952 These  
 2648 Fixed a problem with Control Method references within Package objects. These  
 5953 references are now correctly generated. This completes the package  
 5954 construction overhaul that began in version 20071019.

5956 Example Code and Data Size: These are the sizes for the OS-independent  
 5957 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 5958 debug version of the code includes the debug output trace mechanism and  
 5959 has  
 2654 debug version of the code includes the debug output trace mechanism and has  
 5960 a much larger code and data size.

5962 Previous Release:  
 5963 Non-Debug Version: 78.8K Code, 17.2K Data, 96.0K Total  
 5964 Debug Version: 157.2K Code, 63.4K Data, 220.6K Total  
 5965 Current Release:  
 5966 Non-Debug Version: 79.0K Code, 17.2K Data, 96.2K Total  
 5967 Debug Version: 157.9K Code, 63.6K Data, 221.5K Total

5970 2) iASL Compiler/Disassembler and Tools:

5972 The `AcpiExec` utility now installs handlers for all of the predefined  
 5973 Operation Region types. New types supported are: `PCI_Config`, `CMOS`, and  
 5974 `PCIBARTarget`.

5976 Fixed a problem with the 64-bit version of `AcpiExec` where the extended  
 5977 (64-  
 2671 Fixed a problem with the 64-bit version of `AcpiExec` where the extended (64-  
 5978 bit) address fields for the DSDT and FACS within the FADT were not being  
 5979 used, causing truncation of the upper 32-bits of these addresses. Lin  
 5980 Ming  
 2673 used, causing truncation of the upper 32-bits of these addresses. Lin Ming  
 5981 and Bob Moore

5983 -----  
 5984 19 October 2007. Summary of changes for version 20071019:

5986 1) ACPI CA Core Subsystem:

5988 Fixed a problem with the Alias operator when the target of the alias is a  
 5989 named ASL operator that opens a new scope -- `Scope, Device`,  
 5990 `PowerResource`,  
 2682 named ASL operator that opens a new scope -- `Scope, Device, PowerResource`,  
 5991 Processor, and ThermalZone. In these cases, any children of the original  
 5992 operator could not be accessed via the alias, potentially causing  
 5993 unexpected  
 2684 operator could not be accessed via the alias, potentially causing unexpected  
 5994 `AE_NOT_FOUND` exceptions. (BZ 9067)

5996 Fixed a problem with the Package operator where all named references were

5997 **created as object references and left otherwise unresolved. According to**  
5998 **the**  
5999 **ACPI specification, a Package can only contain Data Objects or references**  
6000 **to**  
2688 *created as object references and left otherwise unresolved. According to the*  
2689 *ACPI specification, a Package can only contain Data Objects or references to*  
6001 *control methods. The implication is that named references to Data Objects*  
6002 *(Integer, Buffer, String, Package, BufferField, Field) should be resolved*  
6003 *immediately upon package creation. This is the approach taken with this*  
6004 *change. References to all other named objects (Methods, Devices, Scopes,*  
6005 *etc.) are all now properly created as reference objects. (BZ 5328)*

6007 Reverted a change to Notify handling that was introduced in version  
6008 20070508. This version changed the Notify handling from asynchronous to  
6009 **fully synchronous (Device driver Notify handling with respect to the**  
6010 **Notify**  
2698 *fully synchronous (Device driver Notify handling with respect to the Notify*  
6011 *ASL operator). It was found that this change caused more problems than it*  
6012 *solved and was removed by most users.*

6014 **Fixed a problem with the Increment and Decrement operators where the type**  
6015 **of**  
2702 *Fixed a problem with the Increment and Decrement operators where the type of*  
6016 *the target object could be unexpectedly and incorrectly changed. (BZ 353)*  
6017 *Lin Ming.*

6019 Fixed a problem with the Load and LoadTable operators where the table  
6020 location within the namespace was ignored. Instead, the table was always  
6021 loaded into the root or current scope. Lin Ming.

6023 Fixed a problem with the Load operator when loading a table from a buffer  
6024 object. The input buffer was prematurely zeroed and/or deleted. (BZ 577)

6026 **Fixed a problem with the Debug object where a store of a DdbHandle**  
6027 **reference**  
2713 *Fixed a problem with the Debug object where a store of a DdbHandle reference*  
6028 *object to the Debug object could cause a fault.*

6030 **Added a table checksum verification for the Load operator, in the case**  
6031 **where**  
2716 *Added a table checksum verification for the Load operator, in the case where*  
6032 *the load is from a buffer. (BZ 578).*

6034 **Implemented additional parameter validation for the LoadTable operator.**  
6035 **The**  
6036 **length of the input strings SignatureString, OemIdString, and OemTableId**  
6037 **are**  
2719 *Implemented additional parameter validation for the LoadTable operator. The*  
2720 *length of the input strings SignatureString, OemIdString, and OemTableId are*  
6038 *now checked for maximum lengths. (BZ 582) Lin Ming.*

6040 Example Code and Data Size: These are the sizes for the OS-independent  
6041 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
6042 **debug version of the code includes the debug output trace mechanism and**  
6043 **has**  
2725 *debug version of the code includes the debug output trace mechanism and has*  
6044 *a much larger code and data size.*

6046 Previous Release:  
6047 Non-Debug Version: 78.5K Code, 17.1K Data, 95.6K Total  
6048 Debug Version: 156.7K Code, 63.2K Data, 219.9K Total  
6049 Current Release:  
6050 Non-Debug Version: 78.8K Code, 17.2K Data, 96.0K Total  
6051 Debug Version: 157.2K Code, 63.4K Data, 220.6K Total

6054 2) iASL Compiler/Disassembler:

6056 Fixed a problem where if a single file was specified and the file did not  
6057 exist, no error message was emitted. (Introduced with wildcard support in  
6058 version 20070917.)

6060 -----  
6061 19 September 2007. Summary of changes for version 20070919:

6063 1) ACPI CA Core Subsystem:

6065 Designed and implemented new external interfaces to install and remove  
6066 **handlers for ACPI table-related events. Current events that are defined**  
6067 **are**  
2748 *handlers for ACPI table-related events. Current events that are defined are*  
6068 *LOAD and UNLOAD. These interfaces allow the host to track ACPI tables as*  
6069 *they are dynamically loaded and unloaded. See AcpiInstallTableHandler and*  
6070 *AcpiRemoveTableHandler. (Lin Ming and Bob Moore)*

6072 Fixed a problem where the use of the AcpiGbl\_AllMethodsSerialized flag  
6073 (acpi\_serialized option on Linux) could cause some systems to hang during  
6074 initialization. (Bob Moore) BZ 8171

6076 Fixed a problem where objects of certain types (Device, ThermalZone,  
6077 Processor, PowerResource) can be not found if they are declared and  
6078 referenced from within the same control method (Lin Ming) BZ 341

6080 Example Code and Data Size: These are the sizes for the OS-independent  
6081 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
6082 **debug version of the code includes the debug output trace mechanism and**  
6083 **has**  
2763 *debug version of the code includes the debug output trace mechanism and has*  
6084 *a much larger code and data size.*

6086 Previous Release:  
6087 Non-Debug Version: 78.3K Code, 17.0K Data, 95.3K Total  
6088 Debug Version: 156.3K Code, 63.1K Data, 219.4K Total  
6089 Current Release:  
6090 Non-Debug Version: 78.5K Code, 17.1K Data, 95.6K Total  
6091 Debug Version: 156.7K Code, 63.2K Data, 219.9K Total

6094 2) iASL Compiler/Disassembler:

6096 **Implemented support to allow multiple files to be compiled/disassembled**  
6097 **in**  
6098 **a**  
6099 **single invocation. This includes command line wildcard support for both**  
6100 **the**  
2776 *Implemented support to allow multiple files to be compiled/disassembled in a*  
2777 *single invocation. This includes command line wildcard support for both the*  
6101 *Windows and Unix versions of the compiler. This feature simplifies the*  
6102 **disassembly and compilation of multiple ACPI tables in a single**  
6103 **directory.**  
2779 *disassembly and compilation of multiple ACPI tables in a single directory.*

6105 -----  
6106 08 May 2007. Summary of changes for version 20070508:

6108 1) ACPI CA Core Subsystem:

6110 **Implemented a Microsoft compatibility design change for the handling of**  
6111 **the**  
2786 *Implemented a Microsoft compatibility design change for the handling of the*  
6112 *Notify AML operator. Previously, notify handlers were dispatched and*  
6113 *executed completely asynchronously in a deferred thread. The new design*

6114 still executes the notify handlers in a different thread, but the  
 6115 original  
 6116 thread that executed the Notify() now waits at a synchronization point  
 6117 for  
 6118 the notify handler to complete. Some machines depend on a synchronous  
 6119 Notify  
 6120 still executes the notify handlers in a different thread, but the original  
 6121 thread that executed the Notify() now waits at a synchronization point for  
 6122 the notify handler to complete. Some machines depend on a synchronous Notify  
 6123 operator in order to operate correctly.

6122 Implemented support to allow Package objects to be passed as method  
 6123 arguments to the external AcpiEvaluateObject interface. Previously, this  
 6124 would return the AE\_NOT\_IMPLEMENTED exception. This feature had not been  
 6125 implemented since there were no reserved control methods that required it  
 6126 until recently.

6128 Fixed a problem with the internal FADT conversion where ACPI 1.0 FADTs  
 6129 that  
 6130 Fixed a problem with the internal FADT conversion where ACPI 1.0 FADTs that  
 6131 contained invalid non-zero values in reserved fields could cause later  
 6132 failures because these fields have meaning in later revisions of the  
 6133 FADT.  
 6134 For incoming ACPI 1.0 FADTs, these fields are now always zeroed. (The  
 6135 fields  
 6136 failures because these fields have meaning in later revisions of the FADT.  
 6137 For incoming ACPI 1.0 FADTs, these fields are now always zeroed. (The fields  
 6138 are: Preferred\_PM\_Profile, PSTATE\_CNT, CST\_CNT, and IAPC\_BOOT\_FLAGS.)

6137 Fixed a problem where the Global Lock handle was not properly updated if  
 6138 a  
 6139 thread that acquired the Global Lock via executing AML code then  
 6140 attempted  
 6141 to acquire the lock via the AcpiAcquireGlobalLock interface. Reported by  
 6142 Joe  
 6143 Fixed a problem where the Global Lock handle was not properly updated if a  
 6144 thread that acquired the Global Lock via executing AML code then attempted  
 6145 to acquire the lock via the AcpiAcquireGlobalLock interface. Reported by Joe  
 6146 Liu.

6145 Fixed a problem in AcpiEvDeleteGpeXrupt where the global interrupt list  
 6146 could be corrupted if the interrupt being removed was at the head of the  
 6147 list. Reported by Linn Crosetto.

6149 Example Code and Data Size: These are the sizes for the OS-independent  
 6150 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6151 debug version of the code includes the debug output trace mechanism and  
 6152 has  
 6153 debug version of the code includes the debug output trace mechanism and has  
 6154 a much larger code and data size.

6155 Previous Release:  
 6156 Non-Debug Version: 78.0K Code, 17.1K Data, 95.1K Total  
 6157 Debug Version: 155.9K Code, 63.1K Data, 219.0K Total  
 6158 Current Release:  
 6159 Non-Debug Version: 78.3K Code, 17.0K Data, 95.3K Total  
 6160 Debug Version: 156.3K Code, 63.1K Data, 219.4K Total

6162 -----  
 6163 20 March 2007. Summary of changes for version 20070320:

6165 1) ACPI CA Core Subsystem:

6167 Implemented a change to the order of interpretation and evaluation of AML  
 6168 operand objects within the AML interpreter. The interpreter now evaluates  
 6169 operands in the order that they appear in the AML stream (and the

6170 corresponding ASL code), instead of in the reverse order (after the  
 6171 entire  
 6172 operand list has been parsed). The previous behavior caused several  
 6173 subtle  
 6174 corresponding ASL code), instead of in the reverse order (after the entire  
 6175 operand list has been parsed). The previous behavior caused several subtle  
 6176 incompatibilities with the Microsoft AML interpreter as well as being  
 6177 somewhat non-intuitive. BZ 7871, local BZ 263. Valery Podrezov.

6177 Implemented a change to the ACPI Global Lock support. All interfaces to  
 6178 the  
 6179 Implemented a change to the ACPI Global Lock support. All interfaces to the  
 6180 global lock now allow the same thread to acquire the lock multiple times.  
 6181 This affects the AcpiAcquireGlobalLock external interface to the global  
 6182 lock  
 6183 This affects the AcpiAcquireGlobalLock external interface to the global lock  
 6184 as well as the internal use of the global lock to support AML fields -- a  
 6185 control method that is holding the global lock can now simultaneously  
 6186 access  
 6187 AML fields that require global lock protection. Previously, in both  
 6188 cases,  
 6189 this would have resulted in an AE\_ALREADY\_ACQUIRED exception. The change  
 6190 to  
 6191 control method that is holding the global lock can now simultaneously access  
 6192 AML fields that require global lock protection. Previously, in both cases,  
 6193 this would have resulted in an AE\_ALREADY\_ACQUIRED exception. The change to  
 6194 AcpiAcquireGlobalLock is of special interest to drivers for the Embedded  
 6195 Controller. There is no change to the behavior of the AML Acquire  
 6196 operator,  
 6197 Controller. There is no change to the behavior of the AML Acquire operator,  
 6198 as this can already be used to acquire a mutex multiple times by the same  
 6199 thread. BZ 8066. With assistance from Alexey Starikovskiy.

6195 Fixed a problem where invalid objects could be referenced in the AML  
 6196 Interpreter after error conditions. During operand evaluation, ensure  
 6197 that  
 6198 Interpreter after error conditions. During operand evaluation, ensure that  
 6199 the internal "Return Object" field is cleared on error and only valid  
 6200 pointers are stored there. Caused occasional access to deleted objects  
 6201 that  
 6202 pointers are stored there. Caused occasional access to deleted objects that  
 6203 resulted in "large reference count" warning messages. Valery Podrezov.

6203 Fixed a problem where an AE\_STACK\_OVERFLOW internal exception could occur  
 6204 on  
 6205 Fixed a problem where an AE\_STACK\_OVERFLOW internal exception could occur on  
 6206 deeply nested control method invocations. BZ 7873, local BZ 487. Valery  
 6207 Podrezov.

6208 Fixed an internal problem with the handling of result objects on the  
 6209 interpreter result stack. BZ 7872. Valery Podrezov.

6211 Removed obsolete code that handled the case where AML\_NAME\_OP is the  
 6212 target  
 6213 Removed obsolete code that handled the case where AML\_NAME\_OP is the target  
 6214 of a reference (Reference.Opcode). This code was no longer necessary. BZ  
 6215 7874. Valery Podrezov.

6216 Removed obsolete ACPI\_NO\_INTEGER64\_SUPPORT from two header files. This  
 6217 was  
 6218 a  
 6219 Removed obsolete ACPI\_NO\_INTEGER64\_SUPPORT from two header files. This was a  
 6220 remnant from the previously discontinued 16-bit support.

6221 Example Code and Data Size: These are the sizes for the OS-independent  
 6222 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The

6223 **debug version of the code includes the debug output trace mechanism and**  
 6224 **has**  
 2874 *debug version of the code includes the debug output trace mechanism and has*  
 6225 a much larger code and data size.

 6230 Current Release:  
 6231 Non-Debug Version: 78.0K Code, 17.1K Data, 95.1K Total  
 6232 Debug Version: 155.9K Code, 63.1K Data, 219.0K Total

6234 -----  
 6235 26 January 2007. Summary of changes for version 20070126:

6237 1) ACPI CA Core Subsystem:

6239 Added the 2007 copyright to all module headers and signons. This affects  
 6240 virtually every file in the ACPICA core subsystem, the iASL compiler, and  
 6241 the utilities.

6243 Implemented a fix for an incorrect parameter passed to AcpiTbDeleteTable  
 6244 **during a table load. A bad pointer was passed in the case where the DSDT**  
 6245 **is**  
 2894 *during a table load. A bad pointer was passed in the case where the DSDT is*  
 6246 overridden, causing a fault in this case.

6248 Example Code and Data Size: These are the sizes for the OS-independent  
 6249 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6250 **debug version of the code includes the debug output trace mechanism and**  
 6251 **has**  
 2899 *debug version of the code includes the debug output trace mechanism and has*  
 6252 a much larger code and data size.

6254 Previous Release:  
 6255 Non-Debug Version: 78.0K Code, 17.1K Data, 95.1K Total  
 6256 Debug Version: 155.8K Code, 63.3K Data, 219.1K Total  
 6257 Current Release:  
 6258 Non-Debug Version: 78.0K Code, 17.1K Data, 95.1K Total  
 6259 Debug Version: 155.8K Code, 63.3K Data, 219.1K Total

6261 -----  
 6262 15 December 2006. Summary of changes for version 20061215:

6264 1) ACPI CA Core Subsystem:

6266 **Support for 16-bit ACPICA has been completely removed since it is no**  
 6267 **longer**  
 2914 *Support for 16-bit ACPICA has been completely removed since it is no longer*  
 6268 necessary and it clutters the code. All 16-bit macros, types, and  
 6269 **conditional compiles have been removed, cleaning up and simplifying the**  
 6270 **code**  
 2916 *conditional compiles have been removed, cleaning up and simplifying the code*  
 6271 across the entire subsystem. DOS support is no longer needed since the  
 6272 bootable Linux firmware kit is now available.

6274 The handler for the Global Lock is now removed during AcpiTerminate to  
 6275 enable a clean subsystem restart, via the implementation of the  
 6276 AcpiEvRemoveGlobalLockHandler function. (With assistance from Joel Bretz,  
 6277 HP)

6279 **Implemented enhancements to the multithreading support within the**  
 6280 **debugger**  
 6281 **to enable improved multithreading debugging and evaluation of the**  
 6282 **subsystem.**  
 2925 *Implemented enhancements to the multithreading support within the debugger*

2926 *to enable improved multithreading debugging and evaluation of the subsystem.*  
 6283 (Valery Podrezov)

6285 **Debugger: Enhanced the Statistics/Memory command to emit the total**  
 6286 **(maximum)**  
 6287 **memory used during the execution, as well as the maximum memory consumed**  
 6288 **by**  
 2929 *Debugger: Enhanced the Statistics/Memory command to emit the total (maximum)*  
 2930 *memory used during the execution, as well as the maximum memory consumed by*  
 6289 each of the various object types. (Valery Podrezov)

6291 Example Code and Data Size: These are the sizes for the OS-independent  
 6292 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6293 **debug version of the code includes the debug output trace mechanism and**  
 6294 **has**  
 2935 *debug version of the code includes the debug output trace mechanism and has*  
 6295 a much larger code and data size.

6297 Previous Release:  
 6298 Non-Debug Version: 77.9K Code, 17.0K Data, 94.9K Total  
 6299 Debug Version: 155.2K Code, 63.1K Data, 218.3K Total  
 6300 Current Release:  
 6301 Non-Debug Version: 78.0K Code, 17.1K Data, 95.1K Total  
 6302 Debug Version: 155.8K Code, 63.3K Data, 219.1K Total

6305 2) iASL Compiler/Disassembler and Tools:

6307 AcpiExec: Implemented a new option (-m) to display full memory use  
 6308 statistics upon subsystem/program termination. (Valery Podrezov)

6310 -----  
 6311 09 November 2006. Summary of changes for version 20061109:

6313 1) ACPI CA Core Subsystem:

6315 **Optimized the Load ASL operator in the case where the source operand is**  
 6316 **an**  
 2956 *Optimized the Load ASL operator in the case where the source operand is an*  
 6317 operation region. Simply map the operation region memory, instead of  
 6318 performing a bitwise read. (Region must be of type SystemMemory, see  
 6319 below.)

6321 Fixed the Load ASL operator for the case where the source operand is a  
 6322 **region field. A buffer object is also allowed as the source operand. BZ**  
 6323 **480**  
 2962 *region field. A buffer object is also allowed as the source operand. BZ 480*

6325 **Fixed a problem where the Load ASL operator allowed the source operand to**  
 6326 **be**  
 2964 *Fixed a problem where the Load ASL operator allowed the source operand to be*  
 6327 an operation region of any type. It is now restricted to regions of type  
 6328 SystemMemory, as per the ACPI specification. BZ 481

6330 Additional cleanup and optimizations for the new Table Manager code.

6332 **AcpiEnable will now fail if all of the required ACPI tables are not**  
 6333 **loaded**  
 2970 *AcpiEnable will now fail if all of the required ACPI tables are not loaded*  
 6334 (FADT, FACS, DSDT). BZ 477

6336 **Added #pragma pack(8/4) to aobject.h to ensure that the structures in**  
 6337 **this**  
 2973 *Added #pragma pack(8/4) to aobject.h to ensure that the structures in this*  
 6338 header are always compiled as aligned. The ACPI\_OPERAND\_OBJECT has been  
 6339 manually optimized to be aligned and will not work if it is byte-packed.

6341 Example Code and Data Size: These are the sizes for the OS-independent  
 6342 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6343 **debug version of the code includes the debug output trace mechanism and**  
 6344 **has**  
 2979 *debug version of the code includes the debug output trace mechanism and has*  
 6345 a much larger code and data size.

6347 Previous Release:  
 6348 Non-Debug Version: 78.1K Code, 17.1K Data, 95.2K Total  
 6349 Debug Version: 155.4K Code, 63.1K Data, 218.5K Total  
 6350 Current Release:  
 6351 Non-Debug Version: 77.9K Code, 17.0K Data, 94.9K Total  
 6352 Debug Version: 155.2K Code, 63.1K Data, 218.3K Total

6355 2) iASL Compiler/Disassembler and Tools:

6357 Fixed a problem where the presence of the \_OSI predefined control method  
 6358 within complex expressions could cause an internal compiler error.

6360 AcpiExec: Implemented full region support for multiple address spaces.  
 6361 SpaceId is now part of the REGION object. BZ 429

6363 -----  
 6364 11 October 2006. Summary of changes for version 20061011:

6366 1) ACPI CA Core Subsystem:

6368 Completed an AML interpreter performance enhancement for control method  
 6369 execution. Previously a 2-pass parse/execution, control methods are now  
 6370 completely parsed and executed in a single pass. This improves overall  
 6371 interpreter performance by ~25%, reduces code size, and reduces CPU stack  
 6372 use. (Valery Podrezov + interpreter changes in version 20051202 that  
 6373 eliminated namespace loading during the pass one parse.)

6375 **Implemented \_CID support for PCI Root Bridge detection. If the \_HID does**  
 6376 **not**  
 6377 **match the predefined PCI Root Bridge IDs, the \_CID list (if present) is**  
 6378 **now**  
 3010 *Implemented \_CID support for PCI Root Bridge detection. If the \_HID does not*  
 3011 *match the predefined PCI Root Bridge IDs, the \_CID list (if present) is now*  
 6379 obtained and also checked for an ID match.

6381 **Implemented additional support for the PCI \_ADR execution: upsearch until**  
 6382 **a**  
 3014 *Implemented additional support for the PCI \_ADR execution: upsearch until a*  
 6383 *device scope is found before executing \_ADR. This allows PCI\_Config*  
 6384 **operation regions to be declared locally within control methods**  
 6385 **underneath**  
 3016 *operation regions to be declared locally within control methods underneath*  
 6386 PCI device objects.

6388 Fixed a problem with a possible race condition between threads executing  
 6389 AcpiWalkNamespace and the AML interpreter. This condition was removed by  
 6390 **modifying AcpiWalkNamespace to (by default) ignore all temporary**  
 6391 **namespace**  
 3021 *modifying AcpiWalkNamespace to (by default) ignore all temporary namespace*  
 6392 *entries created during any concurrent control method execution. An*  
 6393 *additional namespace race condition is known to exist between*  
 6394 *AcpiWalkNamespace and the Load/Unload ASL operators and is still under*  
 6395 *investigation.*

6397 Restructured the AML ParseLoop function, breaking it into several  
 6398 **subfunctions in order to reduce CPU stack use and improve**  
 6399 **maintainability.**

3028 *subfunctions in order to reduce CPU stack use and improve maintainability.*  
 6400 (Mikhail Kouzmich)

6402 **AcpiGetHandle: Fix for parameter validation to detect invalid**  
 6403 **combinations**  
 3031 *AcpiGetHandle: Fix for parameter validation to detect invalid combinations*  
 6404 of prefix handle and pathname. BZ 478

6406 Example Code and Data Size: These are the sizes for the OS-independent  
 6407 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6408 **debug version of the code includes the debug output trace mechanism and**  
 6409 **has**  
 3036 *debug version of the code includes the debug output trace mechanism and has*  
 6410 a much larger code and data size.

6412 Previous Release:  
 6413 Non-Debug Version: 77.9K Code, 17.1K Data, 95.0K Total  
 6414 Debug Version: 154.6K Code, 63.0K Data, 217.6K Total  
 6415 Current Release:  
 6416 Non-Debug Version: 78.1K Code, 17.1K Data, 95.2K Total  
 6417 Debug Version: 155.4K Code, 63.1K Data, 218.5K Total

6419 2) iASL Compiler/Disassembler and Tools:

6421 **Ported the -g option (get local ACPI tables) to the new ACPICA Table**  
 6422 **Manager**  
 3048 *Ported the -g option (get local ACPI tables) to the new ACPICA Table Manager*  
 6423 to restore original behavior.

6425 -----  
 6426 27 September 2006. Summary of changes for version 20060927:

6428 1) ACPI CA Core Subsystem:

6430 Removed the "Flags" parameter from AcpiGetRegister and AcpiSetRegister.  
 6431 These functions now use a spinlock for mutual exclusion and the interrupt  
 6432 level indication flag is not needed.

6434 Fixed a problem with the Global Lock where the lock could appear to be  
 6435 obtained before it is actually obtained. The global lock semaphore was  
 6436 **inadvertently created with one unit instead of zero units. (BZ 464)**  
 6437 **Fiodor**  
 3062 *inadvertently created with one unit instead of zero units. (BZ 464) Fiodor*  
 6438 Suietov.

6440 **Fixed a possible memory leak and fault in AcpiExResolveObjectToValue**  
 6441 **during**  
 3065 *Fixed a possible memory leak and fault in AcpiExResolveObjectToValue during*  
 6442 a read from a buffer or region field. (BZ 458) Fiodor Suietov.

6444 Example Code and Data Size: These are the sizes for the OS-independent  
 6445 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6446 **debug version of the code includes the debug output trace mechanism and**  
 6447 **has**  
 3070 *debug version of the code includes the debug output trace mechanism and has*  
 6448 a much larger code and data size.

6450 Previous Release:  
 6451 Non-Debug Version: 77.9K Code, 17.1K Data, 95.0K Total  
 6452 Debug Version: 154.7K Code, 63.0K Data, 217.7K Total  
 6453 Current Release:  
 6454 Non-Debug Version: 77.9K Code, 17.1K Data, 95.0K Total  
 6455 Debug Version: 154.6K Code, 63.0K Data, 217.6K Total

6458 2) iASL Compiler/Disassembler and Tools:

6460 **Fixed a compilation problem with the pre-defined Resource Descriptor**  
 6461 **field**  
 6462 **names where an "object does not exist" error could be incorrectly**  
 6463 **generated**  
 3083 *Fixed a compilation problem with the pre-defined Resource Descriptor field*  
 3084 *names where an "object does not exist" error could be incorrectly generated*  
 6464 *if the parent ResourceTemplate pathname places the template within a*  
 6465 *different namespace scope than the current scope. (BZ 7212)*

6467 **Fixed a problem where the compiler could hang after syntax errors**  
 6468 **detected**  
 3088 *Fixed a problem where the compiler could hang after syntax errors detected*  
 6469 *in an Elseif construct. (BZ 453)*

6471 *Fixed a problem with the AmlFilename parameter to the DefinitionBlock()*  
 6472 **operator. An incorrect output filename was produced when this parameter**  
 6473 **was**  
 3092 *operator. An incorrect output filename was produced when this parameter was*  
 6474 *a null string (""). Now, the original input filename is used as the AML*  
 6475 *output filename, with an ".aml" extension.*

6477 **Implemented a generic batch command mode for the AcpiExec utility**  
 6478 **(execute**  
 3096 *Implemented a generic batch command mode for the AcpiExec utility (execute*  
 6479 *any AML debugger command) (Valery Podrezov).*

6481 -----  
 6482 12 September 2006. Summary of changes for version 20060912:

6484 1) ACPI CA Core Subsystem:

6486 *Enhanced the implementation of the "serialized mode" of the interpreter*  
 6487 *(enabled via the AcpiGbl\_AllMethodsSerialized flag.) When this mode is*  
 6488 **specified, instead of creating a serialization semaphore per control**  
 6489 **method,**  
 3106 *specified, instead of creating a serialization semaphore per control method,*  
 6490 *the interpreter lock is simply no longer released before a blocking*  
 6491 *operation during control method execution. This effectively makes the AML*  
 6492 *Interpreter single-threaded. The overhead of a semaphore per-method is*  
 6493 *eliminated.*

6495 **Fixed a regression where an error was no longer emitted if a control**  
 6496 **method**  
 3112 *Fixed a regression where an error was no longer emitted if a control method*  
 6497 *attempts to create 2 objects of the same name. This once again returns*  
 6498 **AE\_ALREADY\_EXISTS. When this exception occurs, it invokes the mechanism**  
 6499 **that**  
 3114 *AE\_ALREADY\_EXISTS. When this exception occurs, it invokes the mechanism that*  
 6500 *will dynamically serialize the control method to possible prevent future*  
 6501 *errors. (BZ 440)*

6503 *Integrated a fix for a problem with PCI Express HID detection in the PCI*  
 6504 *Config Space setup procedure. (BZ 7145)*

6506 *Moved all FADT-related functions to a new file, tbfdt.c. Eliminated the*  
 6507 *AcpiHwInitialize function - the FADT registers are now validated when the*  
 6508 *table is loaded.*

6510 **Added two new warnings during FADT verification - 1) if the FADT is**  
 6511 **larger**  
 6512 **than the largest known FADT version, and 2) if there is a mismatch**  
 6513 **between**  
 6514 **a**  
 6515 **32-bit block address and the 64-bit X counterpart (when both are non-**  
 6516 **zero.)**

3125 *Added two new warnings during FADT verification - 1) if the FADT is larger*  
 3126 *than the largest known FADT version, and 2) if there is a mismatch between a*  
 3127 *32-bit block address and the 64-bit X counterpart (when both are non-zero.)*

6518 *Example Code and Data Size: These are the sizes for the OS-independent*  
 6519 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The*  
 6520 **debug version of the code includes the debug output trace mechanism and**  
 6521 **has**  
 3131 *debug version of the code includes the debug output trace mechanism and has*  
 6522 *a much larger code and data size.*

6524 Previous Release:  
 6525 Non-Debug Version: 77.9K Code, 16.7K Data, 94.6K Total  
 6526 Debug Version: 154.9K Code, 62.6K Data, 217.5K Total  
 6527 Current Release:  
 6528 Non-Debug Version: 77.9K Code, 17.1K Data, 95.0K Total  
 6529 Debug Version: 154.7K Code, 63.0K Data, 217.7K Total

6532 2) iASL Compiler/Disassembler and Tools:

6534 **Fixed a problem with the implementation of the Switch() operator where**  
 6535 **the**  
 6536 **temporary variable was declared too close to the actual Switch, instead**  
 6537 **of**  
 3144 *Fixed a problem with the implementation of the Switch() operator where the*  
 3145 *temporary variable was declared too close to the actual Switch, instead of*  
 6538 *at method level. This could cause a problem if the Switch() operator is*  
 6539 *within a while loop, causing an error on the second iteration. (BZ 460)*

6541 *Disassembler - fix for error emitted for unknown type for target of scope*  
 6542 *operator. Now, ignore it and continue.*

6544 *Disassembly of an FADT now verifies the input FADT and reports any errors*  
 6545 *found. Fix for proper disassembly of full-sized (ACPI 2.0) FADTs.*

6547 **Disassembly of raw data buffers with byte initialization data now**  
 6548 **prefixes**  
 3155 *Disassembly of raw data buffers with byte initialization data now prefixes*  
 6549 *each output line with the current buffer offset.*

6551 *Disassembly of ASF! table now includes all variable-length data fields at*  
 6552 *the end of some of the subtables.*

6554 *The disassembler now emits a comment if a buffer appears to be a*  
 6555 **ResourceTemplate, but cannot be disassembled as such because the EndTag**  
 6556 **does**  
 3162 *ResourceTemplate, but cannot be disassembled as such because the EndTag does*  
 6557 *not appear at the very end of the buffer.*

6559 **AcpiExec - Added the "-t" command line option to enable the serialized**  
 6560 **mode**  
 3165 *AcpiExec - Added the "-t" command line option to enable the serialized mode*  
 6561 *of the AML interpreter.*

6563 -----  
 6564 31 August 2006. Summary of changes for version 20060831:

6566 1) ACPI CA Core Subsystem:

6568 *Miscellaneous fixes for the Table Manager:*  
 6569 *- Correctly initialize internal common FADT for all 64-bit "X" fields*  
 6570 *- Fixed a couple table mapping issues during table load*  
 6571 *- Fixed a couple alignment issues for IA64*  
 6572 *- Initialize input array to zero in AcpiInitializeTables*  
 6573 *- Additional parameter validation for AcpiGetTable, AcpiGetTableHeader,*

6574 AcpiGetTableByIndex

6576 **Change for GPE support: when a "wake" GPE is received, all wake GPEs are**  
 6577 **now**  
 3181 *Change for GPE support: when a "wake" GPE is received, all wake GPEs are now*  
 6578 immediately disabled to prevent the waking GPE from firing again and to  
 6579 prevent other wake GPEs from interrupting the wake process.

6581 **Added the AcpiGpeCount global that tracks the number of processed GPEs,**  
 6582 **to**  
 3185 *Added the AcpiGpeCount global that tracks the number of processed GPEs, to*  
 6583 be used for debugging systems with a large number of ACPI interrupts.

6585 Implemented support for the "DMAR" ACPI table (DMA Redirection Table) in  
 6586 both the ACPICA headers and the disassembler.

6588 **Example Code and Data Size: These are the sizes for the OS-independent**  
 6589 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The**  
 6590 **debug version of the code includes the debug output trace mechanism and**  
 6591 **has**  
 3193 *debug version of the code includes the debug output trace mechanism and has*  
 6592 a much larger code and data size.

6594	Previous Release:			
6595	Non-Debug Version:	77.8K Code,	16.5K Data,	94.3K Total
6596	Debug Version:	154.6K Code,	62.3K Data,	216.9K Total
6597	Current Release:			
6598	Non-Debug Version:	77.9K Code,	16.7K Data,	94.6K Total
6599	Debug Version:	154.9K Code,	62.6K Data,	217.5K Total

6602 2) iASL Compiler/Disassembler and Tools:

6604 Disassembler support for the DMAR ACPI table.

6606 -----  
 6607 23 August 2006. Summary of changes for version 20060823:

6609 1) ACPI CA Core Subsystem:

6611 The Table Manager component has been completely redesigned and  
 6612 **reimplemented. The new design is much simpler, and reduces the overall**  
 6613 **code**  
 6614 **and data size of the kernel-resident ACPICA by approximately 5%. Also, it**  
 6615 **is**  
 3214 *reimplemented. The new design is much simpler, and reduces the overall code*  
 3215 *and data size of the kernel-resident ACPICA by approximately 5%. Also, it is*  
 6616 now possible to obtain the ACPI tables very early during kernel  
 6617 initialization, even before dynamic memory management is initialized.  
 6618 (Alexey Starikovskiy, Fiodor Suietov, Bob Moore)

6620 Obsolete ACPICA interfaces:

6622 - **AcpiGetFirmwareTable: Use AcpiGetTable instead (works at early kernel**  
 6623 **init**  
 3222 *- AcpiGetFirmwareTable: Use AcpiGetTable instead (works at early kernel init*  
 6624 *time).*  
 6625 - AcpiLoadTable: Not needed.  
 6626 - AcpiUnloadTable: Not needed.

6628 New ACPICA interfaces:

6630 - **AcpiInitializeTables: Must be called before the table manager can be**  
 6631 **used.**  
 3229 *- AcpiInitializeTables: Must be called before the table manager can be used.*  
 6632 - AcpiReallocateRootTable: Used to transfer the root table to dynamically

6633 allocated memory after it becomes available.  
 6634 - **AcpiGetTableByIndex: Allows the host to easily enumerate all ACPI**  
 6635 **tables**  
 3232 *- AcpiGetTableByIndex: Allows the host to easily enumerate all ACPI tables*  
 6636 in the RSDT/XSDT.

6638 Other ACPICA changes:

6640 - **AcpiGetTableHeader returns the actual mapped table header, not a copy.**  
 6641 **Use**  
 3237 *- AcpiGetTableHeader returns the actual mapped table header, not a copy. Use*  
 6642 *AcpiOsUnmapMemory to free this mapping.*  
 6643 - AcpiGetTable returns the actual mapped table. The mapping is managed  
 6644 internally and must not be deleted by the caller. Use of this interface  
 6645 causes no additional dynamic memory allocation.  
 6646 - **AcpiFindRootPointer: Support for physical addressing has been**  
 6647 **eliminated,**  
 3242 *- AcpiFindRootPointer: Support for physical addressing has been eliminated,*  
 6648 *it appeared to be unused.*  
 6649 - The interface to AcpiOsMapMemory has changed to be consistent with the  
 6650 other allocation interfaces.  
 6651 - **The interface to AcpiOsGetRootPointer has changed to eliminate**  
 6652 **unnecessary**  
 3246 *- The interface to AcpiOsGetRootPointer has changed to eliminate unnecessary*  
 6653 *parameters.*  
 6654 - **ACPI\_PHYSICAL\_ADDRESS is now 32 bits on 32-bit platforms, 64 bits on**  
 6655 **64-**  
 3248 *- ACPI\_PHYSICAL\_ADDRESS is now 32 bits on 32-bit platforms, 64 bits on 64-*  
 6656 *bit platforms. Was previously 64 bits on all platforms.*  
 6657 - **The interface to the ACPI Global Lock acquire/release macros have**  
 6658 **changed**  
 3250 *- The interface to the ACPI Global Lock acquire/release macros have changed*  
 6659 slightly since ACPICA no longer keeps a local copy of the FACS with a  
 6660 constructed pointer to the actual global lock.

6662 Porting to the new table manager:

6664 - **AcpiInitializeTables: Must be called once, and can be called anytime**  
 6665 **during the OS initialization process. It allows the host to specify an**  
 6666 **area**  
 3257 *during the OS initialization process. It allows the host to specify an area*  
 6667 *of memory to be used to store the internal version of the RSDT/XSDT (root*  
 6668 *table). This allows the host to access ACPI tables before memory*  
 6669 *management*  
 3259 *table). This allows the host to access ACPI tables before memory management*  
 6670 *is initialized and running.*  
 6671 - **AcpiReallocateRootTable: Can be called after memory management is**  
 6672 **running**  
 3261 *- AcpiReallocateRootTable: Can be called after memory management is running*  
 6673 *to copy the root table to a dynamically allocated array, freeing up the*  
 6674 *scratch memory specified in the call to AcpiInitializeTables.*  
 6675 - **AcpiSubsystemInitialize: This existing interface is independent of the**  
 6676 **Table Manager, and does not have to be called before the Table Manager**  
 6677 **can**  
 3265 *Table Manager, and does not have to be called before the Table Manager can*  
 6678 *be used, it only must be called before the rest of ACPICA can be used.*  
 6679 - **ACPI Tables: Some changes have been made to the names and structure of**  
 6680 **the**  
 6681 **actbl.h and actbl1.h header files and may require changes to existing**  
 6682 **code.**  
 6683 **For example, bitfields have been completely removed because of their lack**  
 6684 **of**  
 3267 *- ACPI Tables: Some changes have been made to the names and structure of the*  
 3268 *actbl.h and actbl1.h header files and may require changes to existing code.*  
 3269 *For example, bitfields have been completely removed because of their lack of*  
 6685 *portability across C compilers.*

6686 - Update interfaces to the Global Lock acquire/release macros if local  
6687 versions are used. (see acwin.h)

6689 Obsolete files: tbconvrt.c, tbget.c, tbgetall.c, tbrsdt.c

6691 New files: tbfind.c

6693 Example Code and Data Size: These are the sizes for the OS-independent  
6694 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
6695 **debug version of the code includes the debug output trace mechanism and**  
6696 **has**  
3280 *debug version of the code includes the debug output trace mechanism and has*  
6697 a much larger code and data size.

6699 Previous Release:  
6700 Non-Debug Version: 80.7K Code, 17.9K Data, 98.6K Total  
6701 Debug Version: 161.0K Code, 65.1K Data, 226.1K Total  
6702 Current Release:  
6703 Non-Debug Version: 77.8K Code, 16.5K Data, 94.3K Total  
6704 Debug Version: 154.6K Code, 62.3K Data, 216.9K Total

6707 2) iASL Compiler/Disassembler and Tools:

6709 No changes for this release.

6711 -----  
6712 21 July 2006. Summary of changes for version 20060721:

6714 1) ACPI CA Core Subsystem:

6716 The full source code for the ASL test suite used to validate the iASL  
6717 compiler and the ACPICA core subsystem is being released with the ACPICA  
6718 **source for the first time. The source is contained in a separate package**  
6719 **and**  
6720 **consists of over 1100 files that exercise all ASL/AML operators. The**  
6721 **package**  
6722 **should appear on the Intel/ACPI web site shortly. (Valery Podrezov,**  
6723 **Fiodor**  
3302 *source for the first time. The source is contained in a separate package and*  
3303 *consists of over 1100 files that exercise all ASL/AML operators. The package*  
3304 *should appear on the Intel/ACPI web site shortly. (Valery Podrezov, Fiodor*  
6724 *Suietov)*

6726 Completed a new design and implementation for support of the ACPI Global  
6727 Lock. On the OS side, the global lock is now treated as a standard AML  
6728 mutex. Previously, multiple OS threads could "acquire" the global lock  
6729 **simultaneously. However, this could cause the BIOS to be starved out of**  
6730 **the**  
3310 *simultaneously. However, this could cause the BIOS to be starved out of the*  
6731 lock - especially in cases such as the Embedded Controller driver where  
6732 there is a tight coupling between the OS and the BIOS.

6734 Implemented an optimization for the ACPI Global Lock interrupt mechanism.  
6735 The Global Lock interrupt handler no longer queues the execution of a  
6736 **separate thread to signal the global lock semaphore. Instead, the**  
6737 **semaphore**  
3316 *separate thread to signal the global lock semaphore. Instead, the semaphore*  
6738 is signaled directly from the interrupt handler.

6740 Implemented support within the AML interpreter for package objects that  
6741 **contain a larger AML length (package list length) than the package**  
6742 **element**  
3320 *contain a larger AML length (package list length) than the package element*  
6743 count. In this case, the length of the package is truncated to match the  
6744 **package element count. Some BIOS code apparently modifies the package**

6745 **length**  
6746 **on the fly, and this change supports this behavior. Provides**  
6747 **compatibility**  
3322 *package element count. Some BIOS code apparently modifies the package length*  
3323 *on the fly, and this change supports this behavior. Provides compatibility*  
6748 with the MS AML interpreter. (With assistance from Fiodor Suietov)

6750 **Implemented a temporary fix for the BankValue parameter of a Bank Field**  
6751 **to**  
3326 *Implemented a temporary fix for the BankValue parameter of a Bank Field to*  
6752 support all constant values, now including the Zero and One opcodes.  
6753 **Evaluation of this parameter must eventually be converted to a full**  
6754 **TermArg**  
6755 **evaluation. A not-implemented error is now returned (temporarily) for**  
6756 **non-**  
3328 *Evaluation of this parameter must eventually be converted to a full TermArg*  
3329 *evaluation. A not-implemented error is now returned (temporarily) for non-*  
6757 constant values for this parameter.

6759 Fixed problem reports (Fiodor Suietov) integrated:  
6760 **- Fix for premature object deletion after CopyObject on Operation Region**  
6761 **(BZ**  
3333 *- Fix for premature object deletion after CopyObject on Operation Region (BZ*  
6762 350)

6764 Example Code and Data Size: These are the sizes for the OS-independent  
6765 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
6766 **debug version of the code includes the debug output trace mechanism and**  
6767 **has**  
3338 *debug version of the code includes the debug output trace mechanism and has*  
6768 a much larger code and data size.

6770 Previous Release:  
6771 Non-Debug Version: 80.7K Code, 18.0K Data, 98.7K Total  
6772 Debug Version: 160.9K Code, 65.1K Data, 226.0K Total  
6773 Current Release:  
6774 Non-Debug Version: 80.7K Code, 17.9K Data, 98.6K Total  
6775 Debug Version: 161.0K Code, 65.1K Data, 226.1K Total

6778 2) iASL Compiler/Disassembler and Tools:

6780 No changes for this release.

6782 -----  
6783 07 July 2006. Summary of changes for version 20060707:

6785 1) ACPI CA Core Subsystem:

6787 Added the ACPI\_PACKED\_POINTERS\_NOT\_SUPPORTED macro to support C compilers  
6788 that do not allow the initialization of address pointers within packed  
6789 structures - even though the hardware itself may support misaligned  
6790 transfers. Some of the debug data structures are packed by default to  
6791 minimize size.

6793 **Added an error message for the case where AcpiOsGetThreadId() returns**  
6794 **zero.**  
3364 *Added an error message for the case where AcpiOsGetThreadId() returns zero.*  
6795 A non-zero value is required by the core ACPICA code to ensure the proper  
6796 operation of AML mutexes and recursive control methods.

6798 The DSDT is now the only ACPI table that determines whether the AML  
6799 **interpreter is in 32-bit or 64-bit mode. Not really a functional change,**  
6800 **but**  
6801 **the hooks for per-table 32/64 switching have been removed from the code.**  
6802 **A**

3369 interpreter is in 32-bit or 64-bit mode. Not really a functional change, but  
 3370 the hooks for per-table 32/64 switching have been removed from the code. A  
 6803 clarification to the ACPI specification is forthcoming in ACPI 3.0B.

6805 Fixed a possible leak of an OwnerID in the error path of  
 6806 AcpiTbInitTableDescriptor (tbinstal.c), and migrated all table OwnerID  
 6807 deletion to a single place in AcpiTbUninstallTable to correct possible  
 6808 leaks  
 3375 deletion to a single place in AcpiTbUninstallTable to correct possible leaks  
 6809 when using the AcpiTbDeleteTablesByType interface (with assistance from  
 6810 Lance Ortiz.)

6812 Fixed a problem with Serialized control methods where the semaphore  
 6813 associated with the method could be over-sigaled after multiple method  
 6814 invocations.

6816 Fixed two issues with the locking of the internal namespace data  
 6817 structure.  
 3383 Fixed two issues with the locking of the internal namespace data structure.  
 6818 Both the Unload() operator and AcpiUnloadTable interface now lock the  
 6819 namespace during the namespace deletion associated with the table unload  
 6820 (with assistance from Linn Crosetto.)

6822 Fixed problem reports (Valery Podrezov) integrated:  
 6823 - Eliminate unnecessary memory allocation for CreateXxxxField (BZ 5426)

6825 Fixed problem reports (Fiodor Suietov) integrated:  
 6826 - Incomplete cleanup branches in AcpiTbGetTableRsdt (BZ 369)  
 6827 - On Address Space handler deletion, needless deactivation call (BZ 374)  
 6828 - AcpiRemoveAddressSpaceHandler: validate Device handle parameter (BZ  
 6829 375)  
 6830 - Possible memory leak, Notify sub-objects of Processor, Power,  
 6831 ThermalZone  
 3394 - AcpiRemoveAddressSpaceHandler: validate Device handle parameter (BZ 375)  
 3395 - Possible memory leak, Notify sub-objects of Processor, Power, ThermalZone  
 6832 (BZ 376)  
 6833 - AcpiRemoveAddressSpaceHandler: validate Handler parameter (BZ 378)  
 6834 - Minimum Length of RSMT should be validated (BZ 379)  
 6835 - AcpiRemoveNotifyHandler: return AE\_NOT\_EXIST if Processor Obj has no  
 6836 Handler (BZ 380)  
 6837 - AcpiUnloadTable: return AE\_NOT\_EXIST if no table of specified type  
 6838 loaded  
 3401 - AcpiUnloadTable: return AE\_NOT\_EXIST if no table of specified type loaded  
 6839 (BZ 381)

6841 Example Code and Data Size: These are the sizes for the OS-independent  
 6842 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6843 debug version of the code includes the debug output trace mechanism and  
 6844 has  
 3406 debug version of the code includes the debug output trace mechanism and has  
 6845 a much larger code and data size.

6847	Previous Release:	
6848	Non-Debug Version:	80.5K Code, 17.8K Data, 98.3K Total
6849	Debug Version:	160.8K Code, 64.8K Data, 225.6K Total
6850	Current Release:	
6851	Non-Debug Version:	80.7K Code, 17.9K Data, 98.6K Total
6852	Debug Version:	161.0K Code, 65.1K Data, 226.1K Total

6855 2) iASL Compiler/Disassembler and Tools:

6857 Fixed problem reports:  
 6858 Compiler segfault when ASL contains a long (>1024) String declaration (BZ  
 6859 436)

6861 -----  
 6862 23 June 2006. Summary of changes for version 20060623:

6864 1) ACPI CA Core Subsystem:

6866 Implemented a new ACPI\_SPINLOCK type for the OSL lock interfaces. This  
 6867 allows the type to be customized to the host OS for improved efficiency  
 6868 (since a spinlock is usually a very small object.)

6870 Implemented support for "ignored" bits in the ACPI registers. According  
 6871 to  
 3432 Implemented support for "ignored" bits in the ACPI registers. According to  
 6872 the ACPI specification, these bits should be preserved when writing the  
 6873 registers via a read/modify/write cycle. There are 3 bits preserved in  
 6874 this  
 3434 registers via a read/modify/write cycle. There are 3 bits preserved in this  
 6875 manner: PM1\_CONTROL[0] (SCI\_EN), PM1\_CONTROL[9], and PM1\_STATUS[11].

6877 Implemented the initial deployment of new OSL mutex interfaces. Since  
 6878 some  
 3437 Implemented the initial deployment of new OSL mutex interfaces. Since some  
 6879 host operating systems have separate mutex and semaphore objects, this  
 6880 feature was requested. The base code now uses mutexes (and the new mutex  
 6881 interfaces) wherever a binary semaphore was used previously. However, for  
 6882 the current release, the mutex interfaces are defined as macros to map  
 6883 them  
 6884 to the existing semaphore interfaces. Therefore, no OSL changes are  
 6885 required  
 3441 the current release, the mutex interfaces are defined as macros to map them  
 3442 to the existing semaphore interfaces. Therefore, no OSL changes are required  
 6886 at this time. (See acpiosxf.h)

6888 Fixed several problems with the support for the control method SyncLevel  
 6889 parameter. The SyncLevel now works according to the ACPI specification  
 6890 and  
 6891 in concert with the Mutex SyncLevel parameter, since the current  
 6892 SyncLevel  
 6893 is a property of the executing thread. Mutual exclusion for control  
 6894 methods  
 3446 parameter. The SyncLevel now works according to the ACPI specification and  
 3447 in concert with the Mutex SyncLevel parameter, since the current SyncLevel  
 3448 is a property of the executing thread. Mutual exclusion for control methods  
 6895 is now implemented with a mutex instead of a semaphore.

6897 Fixed three instances of the use of the C shift operator in the bitfield  
 6898 support code (exfldio.c) to avoid the use of a shift value larger than  
 6899 the  
 6900 target data width. The behavior of C compilers is undefined in this case  
 6901 and  
 6902 can cause unpredictable results, and therefore the case must be detected  
 6903 and  
 3452 support code (exfldio.c) to avoid the use of a shift value larger than the  
 3453 target data width. The behavior of C compilers is undefined in this case and  
 3454 can cause unpredictable results, and therefore the case must be detected and  
 6904 avoided. (Fiodor Suietov)

6906 Added an info message whenever an SSMT or OEM table is loaded dynamically  
 6907 via the Load() or LoadTable() ASL operators. This should improve  
 6908 debugging  
 6909 capability since it will show exactly what tables have been loaded  
 6910 (beyond  
 3458 via the Load() or LoadTable() ASL operators. This should improve debugging  
 3459 capability since it will show exactly what tables have been loaded (beyond  
 6911 the tables present in the RSMT/XSMT.)

6913 Example Code and Data Size: These are the sizes for the OS-independent

6914 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6915 **debug version of the code includes the debug output trace mechanism and**  
 6916 **has**  
 3464 *debug version of the code includes the debug output trace mechanism and has*  
 6917 a much larger code and data size.

6919 Previous Release:  
 6920 Non-Debug Version: 80.0K Code, 17.6K Data, 97.6K Total  
 6921 Debug Version: 160.2K Code, 64.7K Data, 224.9K Total  
 6922 Current Release:  
 6923 Non-Debug Version: 80.5K Code, 17.8K Data, 98.3K Total  
 6924 Debug Version: 160.8K Code, 64.8K Data, 225.6K Total

6927 2) iASL Compiler/Disassembler and Tools:

6929 No changes for this release.

6931 -----  
 6932 08 June 2006. Summary of changes for version 20060608:

6934 1) ACPI CA Core Subsystem:

6936 **Converted the locking mutex used for the ACPI hardware to a spinlock.**  
 6937 **This**  
 3484 *Converted the locking mutex used for the ACPI hardware to a spinlock. This*  
 6938 change should eliminate all problems caused by attempting to acquire a  
 6939 semaphore at interrupt level, and it means that all ACPICA external  
 6940 **interfaces that directly access the ACPI hardware can be safely called**  
 6941 **from**  
 6942 **interrupt level. OSL code that implements the semaphore interfaces should**  
 6943 **be**  
 3487 *interfaces that directly access the ACPI hardware can be safely called from*  
 3488 *interrupt level. OSL code that implements the semaphore interfaces should be*  
 6944 able to eliminate any workarounds for being called at interrupt level.

6946 Fixed a regression introduced in 20060526 where the ACPI device  
 6947 **initialization could be prematurely aborted with an AE\_NOT\_FOUND if a**  
 6948 **device**  
 3492 *initialization could be prematurely aborted with an AE\_NOT\_FOUND if a device*  
 6949 did not have an optional \_INI method.

6951 Fixed an IndexField issue where a write to the Data Register should be  
 6952 **limited in size to the AccessSize (width) of the IndexField itself. (BZ**  
 6953 **433,**  
 3496 *limited in size to the AccessSize (width) of the IndexField itself. (BZ 433,*  
 6954 Fiodor Suietov)

6956 Fixed problem reports (Valery Podrezov) integrated:  
 6957 - Allow store of ThermalZone objects to Debug object (BZ 5369/5370)

6959 Fixed problem reports (Fiodor Suietov) integrated:  
 6960 - AcpiGetTableHeader doesn't handle multiple instances correctly (BZ 364)

6962 Removed four global mutexes that were obsolete and were no longer being  
 6963 used.

6965 Example Code and Data Size: These are the sizes for the OS-independent  
 6966 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 6967 **debug version of the code includes the debug output trace mechanism and**  
 6968 **has**  
 3510 *debug version of the code includes the debug output trace mechanism and has*  
 6969 a much larger code and data size.

6971 Previous Release:  
 6972 Non-Debug Version: 80.0K Code, 17.7K Data, 97.7K Total

6973 Debug Version: 160.3K Code, 64.9K Data, 225.2K Total  
 6974 Current Release:  
 6975 Non-Debug Version: 80.0K Code, 17.6K Data, 97.6K Total  
 6976 Debug Version: 160.2K Code, 64.7K Data, 224.9K Total

6979 2) iASL Compiler/Disassembler and Tools:

6981 Fixed a fault when using -g option (get tables from registry) on Windows  
 6982 machines.

6984 Fixed problem reports integrated:  
 6985 - Generate error if CreateField NumBits parameter is zero. (BZ 405)  
 6986 - Fault if Offset/Length in Field unit is very large (BZ 432, Fiodor  
 6987 Suietov)  
 6988 - Global table revision override (-r) is ignored (BZ 413)

6990 -----  
 6991 26 May 2006. Summary of changes for version 20060526:

6993 1) ACPI CA Core Subsystem:

6995 Restructured, flattened, and simplified the internal interfaces for  
 6996 **namespace object evaluation - resulting in smaller code, less CPU stack**  
 6997 **use,**  
 3538 *namespace object evaluation - resulting in smaller code, less CPU stack use,*  
 6998 and fewer interfaces. (With assistance from Mikhail Kouzmich)

7000 **Fixed a problem with the CopyObject operator where the first parameter**  
 7001 **was**  
 7002 **not typed correctly for the parser, interpreter, compiler, and**  
 7003 **disassembler.**  
 3541 *Fixed a problem with the CopyObject operator where the first parameter was*  
 3542 *not typed correctly for the parser, interpreter, compiler, and disassembler.*  
 7004 Caused various errors and unexpected behavior.

7006 Fixed a problem where a ShiftLeft or ShiftRight of more than 64 bits  
 7007 produced incorrect results with some C compilers. Since the behavior of C  
 7008 compilers when the shift value is larger than the datatype width is  
 7009 **apparently not well defined, the interpreter now detects this condition**  
 7010 **and**  
 3548 *apparently not well defined, the interpreter now detects this condition and*  
 7011 simply returns zero as expected in all such cases. (BZ 395)

7013 Fixed problem reports (Valery Podrezov) integrated:  
 7014 - Update String-to-Integer conversion to match ACPI 3.0A spec (BZ 5329)  
 7015 - Allow interpreter to handle nested method declarations (BZ 5361)

7017 Fixed problem reports (Fiodor Suietov) integrated:  
 7018 - **AcpiTerminate doesn't free debug memory allocation list objects (BZ**  
 7019 **355)**  
 7020 - **After Core Subsystem shutdown, AcpiSubsystemStatus returns AE\_OK (BZ**  
 7021 **356)**  
 3556 *AcpiTerminate doesn't free debug memory allocation list objects (BZ 355)*  
 3557 *After Core Subsystem shutdown, AcpiSubsystemStatus returns AE\_OK (BZ 356)*  
 7022 - AcpiOsUnmapMemory for RSDP can be invoked inconsistently (BZ 357)  
 7023 - Resource Manager should return AE\_TYPE for non-device objects (BZ 358)  
 7024 - Incomplete cleanup branch in AcpiNsEvaluateRelative (BZ 359)  
 7025 - Use AcpiOsFree instead of ACPI\_FREE in AcpiRsSetSrsMethodData (BZ 360)  
 7026 - Incomplete cleanup branch in AcpiPsParseAml (BZ 361)  
 7027 - Incomplete cleanup branch in AcpiDsDeleteWalkState (BZ 362)  
 7028 - **AcpiGetTableHeader returns AE\_NO\_ACPI\_TABLES until DSDT is loaded (BZ**  
 7029 **365)**  
 3564 *AcpiGetTableHeader returns AE\_NO\_ACPI\_TABLES until DSDT is loaded (BZ 365)*  
 7030 - Status of the Global Initialization Handler call not used (BZ 366)  
 7031 - Incorrect object parameter to Global Initialization Handler (BZ 367)

7033 Example Code and Data Size: These are the sizes for the OS-independent  
 7034 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 7035 **debug version of the code includes the debug output trace mechanism and**  
 7036 **has**  
 3570 *debug version of the code includes the debug output trace mechanism and has*  
 7037 a much larger code and data size.

7039 Previous Release:  
 7040 Non-Debug Version: 79.8K Code, 17.7K Data, 97.5K Total  
 7041 Debug Version: 160.5K Code, 65.1K Data, 225.6K Total  
 7042 Current Release:  
 7043 Non-Debug Version: 80.0K Code, 17.7K Data, 97.7K Total  
 7044 Debug Version: 160.3K Code, 64.9K Data, 225.2K Total

#### 7047 2) iASL Compiler/Disassembler and Tools:

7049 Modified the parser to allow the names IO, DMA, and IRQ to be used as  
 7050 namespace identifiers with no collision with existing resource descriptor  
 7051 macro names. This provides compatibility with other ASL compilers and is  
 7052 **most useful for disassembly/recompilation of existing tables without**  
 7053 **parse**  
 3586 *most useful for disassembly/recompilation of existing tables without parse*  
 7054 errors. (With assistance from Thomas Renninger)

7056 Disassembler: fixed an incorrect disassembly problem with the  
 7057 DataTableRegion and CopyObject operators. Fixed a possible fault during  
 7058 disassembly of some Alias operators.

7060 -----  
 7061 12 May 2006. Summary of changes for version 20060512:

#### 7063 1) ACPI CA Core Subsystem:

7065 Replaced the AcpiOsQueueForExecution interface with a new interface named  
 7066 **AcpiOsExecute. The major difference is that the new interface does not**  
 7067 **have**  
 7068 **a Priority parameter, this appeared to be useless and has been replaced**  
 7069 **by**  
 7070 **a**  
 3599 *AcpiOsExecute. The major difference is that the new interface does not have*  
 3600 *a Priority parameter, this appeared to be useless and has been replaced by a*  
 7071 *Type parameter. The Type tells the host what type of execution is being*  
 7072 *requested, such as global lock handler, notify handler, GPE handler, etc.*  
 7073 **This allows the host to queue and execute the request as appropriate for**  
 7074 **the**  
 7075 **request type, possibly using different work queues and different**  
 7076 **priorities**  
 3603 *This allows the host to queue and execute the request as appropriate for the*  
 3604 *request type, possibly using different work queues and different priorities*  
 7077 *for the various request types. This enables fixes for multithreading*  
 7078 **deadlock problems such as BZ #5534, and will require changes to all**  
 7079 **existing**  
 3606 *deadlock problems such as BZ #5534, and will require changes to all existing*  
 7080 *OS interface layers. (Alexey Starikovskiy and Bob Moore)*

7082 **Fixed a possible memory leak associated with the support for the so-**  
 7083 **called**  
 3609 *Fixed a possible memory leak associated with the support for the so-called*  
 7084 *"implicit return" ACPI extension. Reported by FreeBSD, BZ #6514. (Fiodor*  
 7085 *Suietov)*

7087 Fixed a problem with the Load() operator where a table load from an  
 7088 **operation region could overwrite an internal table buffer by up to 7**  
 7089 **bytes**

7090 **and cause alignment faults on IPF systems. (With assistance from Luming**  
 7091 **Yu)**  
 3614 *operation region could overwrite an internal table buffer by up to 7 bytes*  
 3615 *and cause alignment faults on IPF systems. (With assistance from Luming Yu)*

7093 Example Code and Data Size: These are the sizes for the OS-independent  
 7094 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 7095 **debug version of the code includes the debug output trace mechanism and**  
 7096 **has**  
 3619 *debug version of the code includes the debug output trace mechanism and has*  
 7097 a much larger code and data size.

7099 Previous Release:  
 7100 Non-Debug Version: 79.7K Code, 17.7K Data, 97.4K Total  
 7101 Debug Version: 160.1K Code, 65.2K Data, 225.3K Total  
 7102 Current Release:  
 7103 Non-Debug Version: 79.8K Code, 17.7K Data, 97.5K Total  
 7104 Debug Version: 160.5K Code, 65.1K Data, 225.6K Total

#### 7108 2) iASL Compiler/Disassembler and Tools:

7110 **Disassembler: Implemented support to cross reference the internal**  
 7111 **namespace**  
 7112 **and automatically generate ASL External() statements for symbols not**  
 7113 **defined**  
 3633 *Disassembler: Implemented support to cross reference the internal namespace*  
 3634 *and automatically generate ASL External() statements for symbols not defined*  
 7114 *within the current table being disassembled. This will simplify the*  
 7115 **disassembly and recompilation of interdependent tables such as SSDTs**  
 7116 **since**  
 3636 *disassembly and recompilation of interdependent tables such as SSDTs since*  
 7117 these statements will no longer have to be added manually.

7119 Disassembler: Implemented experimental support to automatically detect  
 7120 **invocations of external control methods and generate appropriate**  
 7121 **External()**  
 7122 **statements. This is problematic because the AML cannot be correctly**  
 7123 **parsed**  
 7124 **until the number of arguments for each control method is known.**  
 7125 **Currently,**  
 3640 *invocations of external control methods and generate appropriate External()*  
 3641 *statements. This is problematic because the AML cannot be correctly parsed*  
 3642 *until the number of arguments for each control method is known. Currently,*  
 7126 *standalone method invocations and invocations as the source operand of a*  
 7127 *Store() statement are supported.*

7129 Disassembler: Implemented support for the ASL pseudo-operators LNotEqual,  
 7130 LLessEqual, and LGreaterEqual. Previously disassembled as LNot(LEqual()),  
 7131 LNot(LGreater()), and LNot(LLess()), this makes the disassembled ASL code  
 7132 more readable and likely closer to the original ASL source.

7134 -----  
 7135 21 April 2006. Summary of changes for version 20060421:

#### 7137 1) ACPI CA Core Subsystem:

7139 Removed a device initialization optimization introduced in 20051216 where  
 7140 the \_STA method was not run unless an \_INI was also present for the same  
 7141 **device. This optimization could cause problems because it could allow**  
 7142 **\_INI**  
 3658 *device. This optimization could cause problems because it could allow \_INI*  
 7143 *methods to be run within a not-present device subtree. (If a not-present*  
 7144 *device had no \_INI, \_STA would not be run, the not-present status would*  
 7145 *not*

3660 device had no `_INI`, `_STA` would not be run, the not-present status would not  
 7146 be discovered, and the children of the device would be incorrectly  
 7147 traversed.)

7149 Implemented a new `_STA` optimization where namespace subtrees that do not  
 7150 contain `_INI` are identified and ignored during device initialization.  
 7151 Selectively running `_STA` can significantly improve boot time on large  
 7152 machines (with assistance from Len Brown.)

7154 Implemented support for the device initialization case where the returned  
 7155 `_STA` flags indicate a device not-present but functioning. In this case,  
 7156 `_INI`  
 3670 `_STA` flags indicate a device not-present but functioning. In this case, `_INI`  
 7157 is not run, but the device children are examined for presence, as per the  
 7158 ACPI specification.

7160 Implemented an additional change to the `IndexField` support in order to  
 7161 conform to MS behavior. The value written to the `Index Register` is not  
 7162 simply a byte offset, it is a byte offset in units of the access width of  
 7163 the parent `Index Field`. (Fiodor Suietov)

7165 Defined and deployed a new OSL interface, `AcpiOsValidateAddress`. This  
 7166 interface is called during the creation of all AML operation regions, and  
 7167 allows the host OS to exert control over what addresses it will allow the  
 7168 AML code to access. Operation Regions whose addresses are disallowed will  
 7169 cause a runtime exception when they are actually accessed (will not  
 7170 affect  
 3683 cause a runtime exception when they are actually accessed (will not affect  
 7171 or abort table loading.) See `oswinxf` or `osunixxf` for an example  
 7172 implementation.

7174 Defined and deployed a new OSL interface, `AcpiOsValidateInterface`. This  
 7175 interface allows the host OS to match the various "optional"  
 7176 interface/behavior strings for the `_OSI` predefined control method as  
 7177 appropriate (with assistance from Bjorn Helgaas.) See `oswinxf` or `osunixxf`  
 7178 for an example implementation.

7180 Restructured and corrected various problems in the exception handling  
 7181 code  
 3693 Restructured and corrected various problems in the exception handling code  
 7182 paths within `DsCallControlMethod` and `DsTerminateControlMethod` in `dsmethod`  
 7183 (with assistance from Takayoshi Kochi.)

7185 Modified the Linux source converter to ignore quoted string literals  
 7186 while  
 7187 converting identifiers from mixed to lower case. This will correct  
 7188 problems  
 3697 Modified the Linux source converter to ignore quoted string literals while  
 3698 converting identifiers from mixed to lower case. This will correct problems  
 7189 with the disassembler and other areas where such strings must not be  
 7190 modified.

7192 The `ACPI_FUNCTION_*` macros no longer require quotes around the function  
 7193 name. This allows the Linux source converter to convert the names, now  
 7194 that  
 3703 name. This allows the Linux source converter to convert the names, now that  
 7195 the converter ignores quoted strings.

7197 Example Code and Data Size: These are the sizes for the OS-independent  
 7198 `acpica.lib` produced by the Microsoft Visual C++ 6.0 32-bit compiler. The  
 7199 debug version of the code includes the debug output trace mechanism and  
 7200 has  
 3708 debug version of the code includes the debug output trace mechanism and has  
 7201 a much larger code and data size.

7203 Previous Release:

7205 Non-Debug Version: 81.1K Code, 17.7K Data, 98.8K Total  
 7206 Debug Version: 158.9K Code, 64.9K Data, 223.8K Total  
 7207 Current Release:  
 7208 Non-Debug Version: 79.7K Code, 17.7K Data, 97.4K Total  
 7209 Debug Version: 160.1K Code, 65.2K Data, 225.3K Total

7212 2) iASL Compiler/Disassembler and Tools:

7214 Implemented 3 new warnings for iASL, and implemented multiple warning  
 7215 levels  
 3722 Implemented 3 new warnings for iASL, and implemented multiple warning levels  
 7216 (w2 flag).

7218 1) Ignored timeouts: If the `TimeoutValue` parameter to `Wait` or `Acquire` is  
 7219 not  
 3725 1) Ignored timeouts: If the `TimeoutValue` parameter to `Wait` or `Acquire` is not  
 7220 `WAIT_FOREVER` (0xFFFF) and the code does not examine the return value to  
 7221 check for the possible timeout, a warning is issued.

7223 2) Useless operators: If an ASL operator does not specify an optional  
 7224 target  
 3729 2) Useless operators: If an ASL operator does not specify an optional target  
 7225 operand and it also does not use the function return value from the  
 7226 operator, a warning is issued since the operator effectively does  
 7227 nothing.  
 3731 operator, a warning is issued since the operator effectively does nothing.

7229 3) Unreferenced objects: If a namespace object is created, but never  
 7230 referenced, a warning is issued. This is a warning level 2 since there  
 7231 are  
 7232 cases where this is ok, such as when a secondary table is loaded that  
 7233 uses  
 7234 the unreferenced objects. Even so, care is taken to only flag objects  
 7235 that  
 3734 referenced, a warning is issued. This is a warning level 2 since there are  
 3735 cases where this is ok, such as when a secondary table is loaded that uses  
 3736 the unreferenced objects. Even so, care is taken to only flag objects that  
 7236 don't look like they will ever be used. For example, the reserved methods  
 7237 (starting with an underscore) are usually not referenced because it is  
 7238 expected that the OS will invoke them.

7240 -----

7241 31 March 2006. Summary of changes for version 20060331:

7243 1) ACPI CA Core Subsystem:

7245 Implemented header file support for the following additional ACPI tables:  
 7246 `ASF!`, `BOOT`, `CPEP`, `DBGP`, `MCFG`, `SPCR`, `SPMI`, `TCPA`, and `WRT`. With this  
 7247 support,  
 7248 all current and known ACPI tables are now defined in the ACPICA headers  
 7249 and  
 3747 `ASF!`, `BOOT`, `CPEP`, `DBGP`, `MCFG`, `SPCR`, `SPMI`, `TCPA`, and `WRT`. With this support,  
 7248 all current and known ACPI tables are now defined in the ACPICA headers and  
 7250 are available for use by device drivers and other software.

7252 Implemented support to allow tables that contain ACPI names with invalid  
 7253 characters to be loaded. Previously, this would cause the table load to  
 7254 fail, but since there are several known cases of such tables on existing  
 7255 machines, this change was made to enable ACPI support for them. Also,  
 7256 this  
 3754 machines, this change was made to enable ACPI support for them. Also, this  
 7257 matches the behavior of the Microsoft ACPI implementation.

7259 Fixed a couple regressions introduced during the memory optimization in

7260 **the**  
 7357 *Fixed a couple regressions introduced during the memory optimization in the*  
 7261 *20060317 release. The namespace node definition required additional*  
 7262 **reorganization and an internal datatype that had been changed to 8-bit**  
 7263 **was**  
 7359 *reorganization and an internal datatype that had been changed to 8-bit was*  
 7264 *restored to 32-bit. (Valery Podrezov)*

7266 *Fixed a problem where a null pointer passed to AcpiUtDeleteGenericState*  
 7267 *could be passed through to AcpiOsReleaseObject which is unexpected. Such*  
 7268 *null pointers are now trapped and ignored, matching the behavior of the*  
 7269 *previous implementation before the deployment of AcpiOsReleaseObject.*  
 7270 *(Valery Podrezov, Fiodor Suietov)*

7272 **Fixed a memory mapping leak during the deletion of a SystemMemory**  
 7273 **operation**  
 7368 *Fixed a memory mapping leak during the deletion of a SystemMemory operation*  
 7274 *region where a cached memory mapping was not deleted. This became a*  
 7275 **noticeable problem for operation regions that are defined within**  
 7276 **frequently**  
 7370 *noticeable problem for operation regions that are defined within frequently*  
 7277 *used control methods. (Dana Meyers)*

7279 *Reorganized the ACPI table header files into two main files: one for the*  
 7280 **ACPI tables consumed by the ACPICA core, and another for the**  
 7281 **miscellaneous**  
 7282 **ACPI tables that are consumed by the drivers and other software. The**  
 7283 **various**  
 7374 *ACPI tables consumed by the ACPICA core, and another for the miscellaneous*  
 7375 *ACPI tables that are consumed by the drivers and other software. The various*  
 7284 *FADT definitions were merged into one common section and three different*  
 7285 *tables (ACPI 1.0, 1.0+, and 2.0)*

7287 *Example Code and Data Size: These are the sizes for the OS-independent*  
 7288 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. The*  
 7289 **debug version of the code includes the debug output trace mechanism and**  
 7290 **has**  
 7381 *debug version of the code includes the debug output trace mechanism and has*  
 7291 *a much larger code and data size.*

7293	Previous Release:	
7294	Non-Debug Version:	80.9K Code, 17.7K Data, 98.6K Total
7295	Debug Version:	158.7K Code, 64.8K Data, 223.5K Total
7296	Current Release:	
7297	Non-Debug Version:	81.1K Code, 17.7K Data, 98.8K Total
7298	Debug Version:	158.9K Code, 64.9K Data, 223.8K Total

7301 2) iASL Compiler/Disassembler and Tools:

7303 *Disassembler: Implemented support to decode and format all non-AML ACPI*  
 7304 *tables (tables other than DSDTs and SSDTs.) This includes the new tables*  
 7305 **added to the ACPICA headers, therefore all current and known ACPI tables**  
 7306 **are**  
 7396 *added to the ACPICA headers, therefore all current and known ACPI tables are*  
 7307 *supported.*

7309 *Disassembler: The change to allow ACPI names with invalid characters also*  
 7310 **enables the disassembly of such tables. Invalid characters within names**  
 7311 **are**  
 7380 *enables the disassembly of such tables. Invalid characters within names are*  
 7312 *changed to '\*' to make the name printable; the iASL compiler will still*  
 7313 *generate an error for such names, however, since this is an invalid ACPI*  
 7314 *character.*

7316 **Implemented an option for AcpiXtract (-a) to extract all tables found in**

7317 **the**  
 3805 *Implemented an option for AcpiXtract (-a) to extract all tables found in the*  
 7318 *input file. The default invocation extracts only the DSDTs and SSDTs.*

7320 *Fixed a couple of gcc generation issues for iASL and AcpiExec and added a*  
 7321 *makefile for the AcpiXtract utility.*

7323 -----  
 7324 17 March 2006. Summary of changes for version 20060317:

7326 1) ACPI CA Core Subsystem:

7328 *Implemented the use of a cache object for all internal namespace nodes.*  
 7329 *Since there are about 1000 static nodes in a typical system, this will*  
 7330 **decrease memory use for cache implementations that minimize per-**  
 7331 **allocation**  
 3818 *decrease memory use for cache implementations that minimize per-allocation*  
 7332 *overhead (such as a slab allocator.)*

7334 **Removed the reference count mechanism for internal namespace nodes, since**  
 7335 **it**  
 3821 *Removed the reference count mechanism for internal namespace nodes, since it*  
 7336 *was deemed unnecessary. This reduces the size of each namespace node by*  
 7337 **about 5%-10% on all platforms. Nodes are now 20 bytes for the 32-bit**  
 7338 **case,**  
 3823 *about 5%-10% on all platforms. Nodes are now 20 bytes for the 32-bit case,*  
 7339 *and 32 bytes for the 64-bit case.*

7341 **Optimized several internal data structures to reduce object size on 64-**  
 7342 **bit**  
 3826 *Optimized several internal data structures to reduce object size on 64-bit*  
 7343 *platforms by packing data within the 64-bit alignment. This includes the*  
 7344 *frequently used ACPI\_OPERAND\_OBJECT, of which there can be ~1000 static*  
 7345 *instances corresponding to the namespace objects.*

7347 **Added two new strings for the predefined \_OSI method: "Windows 2001.1**  
 7348 **SP1"**  
 3831 *Added two new strings for the predefined \_OSI method: "Windows 2001.1 SP1"*  
 7349 *and "Windows 2006".*

7351 *Split the allocation tracking mechanism out to a separate file, from*  
 7352 *utalloc.c to uttrack.c. This mechanism appears to be only useful for*  
 7353 *application-level code. Kernels may wish to not include uttrack.c in*  
 7354 *distributions.*

7356 **Removed all remnants of the obsolete ACPI\_REPORT\_\* macros and the**  
 7357 **associated**  
 3839 *Removed all remnants of the obsolete ACPI\_REPORT\_\* macros and the associated*  
 7358 *code. (These macros have been replaced by the ACPI\_ERROR and ACPI\_WARNING*  
 7359 *macros.)*

7361 **Code and Data Size: These are the sizes for the acpica.lib produced by**  
 7362 **the**  
 7363 **Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any**  
 7364 **ACPI**  
 7365 **driver or OSPM code. The debug version of the code includes the debug**  
 7366 **output**  
 3843 *Code and Data Size: These are the sizes for the acpica.lib produced by the*  
 3844 *Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI*  
 3845 *driver or OSPM code. The debug version of the code includes the debug output*  
 7367 *trace mechanism and has a much larger code and data size. Note that these*  
 7368 *values will vary depending on the efficiency of the compiler and the*  
 7369 *compiler options used during generation.*

7371	Previous Release:	
7372	Non-Debug Version:	81.1K Code, 17.8K Data, 98.9K Total

7373      Debug Version:       161.6K Code, 65.7K Data, 227.3K Total  
 7374      Current Release:  
 7375      Non-Debug Version:   80.9K Code, 17.7K Data, 98.6K Total  
 7376      Debug Version:       158.7K Code, 64.8K Data, 223.5K Total

7379 2) iASL Compiler/Disassembler and Tools:

7381 **Implemented an ANSI C version of the acpixtract utility. This version**  
 7382 **will**  
 7386 *Implemented an ANSI C version of the acpixtract utility. This version will*  
 7383 automatically extract the DSDT and all SSDTs from the input acpidump text  
 7384 file and dump the binary output to separate files. It can also display a  
 7385 summary of the input file including the headers for each table found and  
 7386 will extract any single ACPI table, with any signature. (See  
 7387 source/tools/acpixtract)

7389 -----  
 7390 10 March 2006. Summary of changes for version 20060310:

7392 1) ACPI CA Core Subsystem:

7394 Tagged all external interfaces to the subsystem with the new  
 7395 **ACPI\_EXPORT\_SYMBOL** macro. This macro can be defined as necessary to  
 7396 **assist**  
 7373 *ACPI\_EXPORT\_SYMBOL* macro. This macro can be defined as necessary to assist  
 7397 kernel integration. For Linux, the macro resolves to the EXPORT\_SYMBOL  
 7398 macro. The default definition is NULL.

7400 **Added the ACPI\_THREAD\_ID type for the return value from**  
 7401 **AcpiOsGetThreadId.**  
 7377 *Added the ACPI\_THREAD\_ID type for the return value from AcpiOsGetThreadId.*  
 7402 This allows the host to define this as necessary to simplify kernel  
 7403 integration. The default definition is ACPI\_NATIVE\_UINT.

7405 **Fixed two interpreter problems related to error processing, the deletion**  
 7406 **of**  
 7381 *Fixed two interpreter problems related to error processing, the deletion of*  
 7407 objects, and placing invalid pointers onto the internal operator result  
 7408 stack. BZ 6028, 6151 (Valery Podrezov)

7410 **Increased the reference count threshold where a warning is emitted for**  
 7411 **large**  
 7412 **reference counts in order to eliminate unnecessary warnings on systems**  
 7413 **with**  
 7385 *Increased the reference count threshold where a warning is emitted for large*  
 7386 *reference counts in order to eliminate unnecessary warnings on systems with*  
 7414 *large namespaces (especially 64-bit.) Increased the value from 0x400 to*  
 7415 *0x800.*

7417 **Due to universal disagreement as to the meaning of the 'c' in the**  
 7418 **calloc()**  
 7390 *Due to universal disagreement as to the meaning of the 'c' in the calloc()*  
 7419 *function, the ACPI\_MEM\_CALLOCATE macro has been renamed to*  
 7420 *ACPI\_ALLOCATE\_ZEROED so that the purpose of the interface is 'clear'.*  
 7421 *ACPI\_MEM\_ALLOCATE and ACPI\_MEM\_FREE are renamed to ACPI\_ALLOCATE and*  
 7422 *ACPI\_FREE.*

7424 **Code and Data Size: These are the sizes for the acpica.lib produced by**  
 7425 **the**  
 7426 **Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any**  
 7427 **ACPI**  
 7428 **driver or OSPM code. The debug version of the code includes the debug**  
 7429 **output**  
 7396 *Code and Data Size: These are the sizes for the acpica.lib produced by the*  
 7397 *Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI*

3898 *driver or OSPM code. The debug version of the code includes the debug output*  
 7430 *trace mechanism and has a much larger code and data size. Note that these*  
 7431 *values will vary depending on the efficiency of the compiler and the*  
 7432 *compiler options used during generation.*

7434      Previous Release:  
 7435      Non-Debug Version:   81.0K Code, 17.8K Data, 98.8K Total  
 7436      Debug Version:       161.4K Code, 65.7K Data, 227.1K Total  
 7437      Current Release:  
 7438      Non-Debug Version:   81.1K Code, 17.8K Data, 98.9K Total  
 7439      Debug Version:       161.6K Code, 65.7K Data, 227.3K Total

7442 2) iASL Compiler/Disassembler:

7444 Disassembler: implemented support for symbolic resource descriptor  
 7445 **references. If a CreateXxxxField operator references a fixed offset**  
 7446 **within**  
 7447 **a**  
 7448 **resource descriptor, a name is assigned to the descriptor and the offset**  
 7449 **is**  
 7394 *references. If a CreateXxxxField operator references a fixed offset within a*  
 7395 *resource descriptor, a name is assigned to the descriptor and the offset is*  
 7450 *translated to the appropriate resource tag and pathname. The addition of*  
 7451 *this support brings the disassembled code very close to the original ASL*  
 7452 **source code and helps eliminate run-time errors when the disassembled**  
 7453 **code**  
 7398 *source code and helps eliminate run-time errors when the disassembled code*  
 7454 *is modified (and recompiled) in such a way as to invalidate the original*  
 7455 *fixed offsets.*

7457 **Implemented support for a Descriptor Name as the last parameter to the**  
 7458 **ASL**  
 7392 *Implemented support for a Descriptor Name as the last parameter to the ASL*  
 7459 *Register() macro. This parameter was inadvertently left out of the ACPI*  
 7460 *specification, and will be added for ACPI 3.0b.*

7462 Fixed a problem where the use of the "\_OSI" string (versus the full path  
 7463 "\\\_OSI") caused an internal compiler error. ("No back ptr to op")

7465 **Fixed a problem with the error message that occurs when an invalid string**  
 7466 **is**  
 7467 **used for a \_HID object (such as one with an embedded asterisk:**  
 7468 **"\*PNP010A".)**  
 7329 *Fixed a problem with the error message that occurs when an invalid string is*  
 7390 *used for a \_HID object (such as one with an embedded asterisk: "\*PNP010A".)*  
 7469 *The correct message is now displayed.*

7471 -----  
 7472 17 February 2006. Summary of changes for version 20060217:

7474 1) ACPI CA Core Subsystem:

7476 **Implemented a change to the IndexField support to match the behavior of**  
 7477 **the**  
 7478 **Microsoft AML interpreter. The value written to the Index register is now**  
 7479 **a**  
 7480 **byte offset, no longer an index based upon the width of the Data**  
 7481 **register.**  
 7398 *Implemented a change to the IndexField support to match the behavior of the*  
 7399 *Microsoft AML interpreter. The value written to the Index register is now a*  
 7400 *byte offset, no longer an index based upon the width of the Data register.*  
 7482 *This should fix IndexField problems seen on some machines where the Data*  
 7483 *register is not exactly one byte wide. The ACPI specification will be*  
 7484 *clarified on this point.*

7486 Fixed a problem where several resource descriptor types could overrun the  
 7487 internal descriptor buffer due to size miscalculation: VendorShort,  
 7488 VendorLong, and Interrupt. This was noticed on IA64 machines, but could  
 7489 affect all platforms.

7491 **Fixed a problem where individual resource descriptors were misaligned  
 7492 within**  
 3950 *Fixed a problem where individual resource descriptors were misaligned within*  
 7493 the internal buffer, causing alignment faults on IA64 platforms.

7495 **Code and Data Size: These are the sizes for the acpica.lib produced by  
 7496 the**  
 7497 **Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any  
 7498 ACPI**  
 7499 **driver or OSPM code. The debug version of the code includes the debug  
 7500 output**  
 3953 *Code and Data Size: These are the sizes for the acpica.lib produced by the*  
 3954 *Microsoft Visual C++ 6.0 32-bit compiler. The values do not include any ACPI*  
 3955 *driver or OSPM code. The debug version of the code includes the debug output*  
 7501 trace mechanism and has a much larger code and data size. Note that these  
 7502 values will vary depending on the efficiency of the compiler and the  
 7503 compiler options used during generation.

7505	Previous Release:	
7506	Non-Debug Version:	81.1K Code, 17.8K Data, 98.9K Total
7507	Debug Version:	161.3K Code, 65.6K Data, 226.9K Total
7508	Current Release:	
7509	Non-Debug Version:	81.0K Code, 17.8K Data, 98.8K Total
7510	Debug Version:	161.4K Code, 65.7K Data, 227.1K Total

7513 2) iASL Compiler/Disassembler:

7515 Implemented support for new reserved names: \_WDG and \_WED are Microsoft  
 7516 extensions for Windows Instrumentation Management, \_TDL is a new ACPI-  
 7517 defined method (Throttling Depth Limit.)

7519 Fixed a problem where a zero-length VendorShort or VendorLong resource  
 7520 descriptor was incorrectly emitted as a descriptor of length one.

7522 -----  
 7523 10 February 2006. Summary of changes for version 20060210:

7525 1) ACPI CA Core Subsystem:

7527 Removed a couple of extraneous ACPI\_ERROR messages that appeared during  
 7528 normal execution. These became apparent after the conversion from  
 7529 ACPI\_DEBUG\_PRINT.

7531 **Fixed a problem where the CreateField operator could hang if the BitIndex  
 7532 or**  
 3986 *Fixed a problem where the CreateField operator could hang if the BitIndex or*  
 7533 NumBits parameter referred to a named object. (Valery Podrezov, BZ 5359)

7535 Fixed a problem where a DeRefOf operation on a buffer object incorrectly  
 7536 failed with an exception. This also fixes a couple of related RefOf and  
 7537 DeRefOf issues. (Valery Podrezov, BZ 5360/5392/5387)

7539 **Fixed a problem where the AE\_BUFFER\_LIMIT exception was returned instead  
 7540 of**  
 7541 **AE\_STRING\_LIMIT on an out-of-bounds Index() operation. (Valery Podrezov,  
 7542 BZ**  
 3993 *Fixed a problem where the AE\_BUFFER\_LIMIT exception was returned instead of*  
 3994 *AE\_STRING\_LIMIT on an out-of-bounds Index() operation. (Valery Podrezov, BZ*  
 7543 5480)

7545 **Implemented a memory cleanup at the end of the execution of each  
 7546 iteration**  
 7547 **of an AML While() loop, preventing the accumulation of outstanding  
 7548 objects.**  
 3997 *Implemented a memory cleanup at the end of the execution of each iteration*  
 3998 *of an AML While() loop, preventing the accumulation of outstanding objects.*  
 7549 (Valery Podrezov, BZ 5427)

7551 **Eliminated a chunk of duplicate code in the object resolution code.  
 7552 (Valery**  
 4001 *Eliminated a chunk of duplicate code in the object resolution code. (Valery*  
 7553 Podrezov, BZ 5336)

7555 Fixed several warnings during the 64-bit code generation.

7557 **The AcpiSrc source code conversion tool now inserts one line of  
 7558 whitespace**  
 7559 **after an if() statement that is followed immediately by a comment,  
 7560 improving**  
 4006 *The AcpiSrc source code conversion tool now inserts one line of whitespace*  
 4007 *after an if() statement that is followed immediately by a comment, improving*  
 7561 readability of the Linux code.

7563 Code and Data Size: The current and previous library sizes for the core  
 7564 subsystem are shown below. These are the code and data sizes for the  
 7565 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
 7566 **These**  
 7567 **values do not include any ACPI driver or OSPM code. The debug version of  
 7568 the**  
 4012 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
 4013 *values do not include any ACPI driver or OSPM code. The debug version of the*  
 7569 code includes the debug output trace mechanism and has a much larger code  
 7570 **and data size. Note that these values will vary depending on the  
 7571 efficiency**  
 4015 *and data size. Note that these values will vary depending on the efficiency*  
 7572 of the compiler and the compiler options used during generation.

7582 2) iASL Compiler/Disassembler:

7584 **Fixed a problem with the disassembly of a BankField operator with a  
 7585 complex**  
 4028 *Fixed a problem with the disassembly of a BankField operator with a complex*  
 7586 expression for the BankValue parameter.

7588 -----  
 7589 27 January 2006. Summary of changes for version 20060127:

7591 1) ACPI CA Core Subsystem:

7593 **Implemented support in the Resource Manager to allow unresolved  
 7594 namestring**  
 7595 **references within resource package objects for the \_PRT method. This  
 7596 support**  
 4036 *Implemented support in the Resource Manager to allow unresolved namestring*  
 4037 *references within resource package objects for the \_PRT method. This support*  
 7597 is in addition to the previously implemented unresolved reference support  
 7598 within the AML parser. If the interpreter slack mode is enabled, these  
 7599 **unresolved references will be passed through to the caller as a NULL**

7600 **package**  
4040 *unresolved references will be passed through to the caller as a NULL package*  
7601 entry.

7603 Implemented and deployed new macros and functions for error and warning  
7604 messages across the subsystem. These macros are simpler and generate less  
7605 code than their predecessors. The new macros ACPI\_ERROR, ACPI\_EXCEPTION,  
7606 ACPI\_WARNING, and ACPI\_INFO replace the ACPI\_REPORT\_\* macros. The older  
7607 macros remain defined to allow ACPI drivers time to migrate to the new  
7608 macros.

7610 **Implemented the ACPI\_CPU\_FLAGS type to simplify host OS integration of**  
7611 **the**  
4050 *Implemented the ACPI\_CPU\_FLAGS type to simplify host OS integration of the*  
7612 *Acquire/Release Lock OSL interfaces.*

7614 Fixed a problem where Alias ASL operators are sometimes not correctly  
7615 resolved, in both the interpreter and the iASL compiler.

7617 **Fixed several problems with the implementation of the**  
7618 **ConcatenateResTemplate**  
4056 *Fixed several problems with the implementation of the ConcatenateResTemplate*  
7619 ASL operator. As per the ACPI specification, zero length buffers are now  
7620 treated as a single EndTag. One-length buffers always cause a fatal  
7621 **exception. Non-zero length buffers that do not end with a full 2-byte**  
7622 **EndTag**  
4059 *exception. Non-zero length buffers that do not end with a full 2-byte EndTag*  
7623 cause a fatal exception.

7625 Fixed a possible structure overwrite in the AcpiGetObjectInfo external  
7626 interface. (With assistance from Thomas Renninger)

7628 Code and Data Size: The current and previous library sizes for the core  
7629 subsystem are shown below. These are the code and data sizes for the  
7630 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
7631 **These**  
7632 **values do not include any ACPI driver or OSPM code. The debug version of**  
7633 **the**  
4067 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
4068 *values do not include any ACPI driver or OSPM code. The debug version of the*  
7634 code includes the debug output trace mechanism and has a much larger code  
7635 **and data size. Note that these values will vary depending on the**  
7636 **efficiency**  
4070 *and data size. Note that these values will vary depending on the efficiency*  
7637 of the compiler and the compiler options used during generation.

7639	Previous Release:	
7640	Non-Debug Version:	83.1K Code, 18.4K Data, 101.5K Total
7641	Debug Version:	163.2K Code, 66.2K Data, 229.4K Total
7642	Current Release:	
7643	Non-Debug Version:	81.0K Code, 17.9K Data, 98.9K Total
7644	Debug Version:	161.3K Code, 65.7K Data, 227.0K Total

7647 2) iASL Compiler/Disassembler:

7649 **Fixed an internal error that was generated for any forward references to**  
7650 **ASL**  
4083 *Fixed an internal error that was generated for any forward references to ASL*  
7651 *Alias objects.*

7653 -----  
7654 13 January 2006. Summary of changes for version 20060113:

7656 1) ACPI CA Core Subsystem:

7658 Added 2006 copyright to all module headers and signons. This affects  
7659 virtually every file in the ACPICA core subsystem, iASL compiler, and the  
7660 utilities.

7661  
7662 **Enhanced the ACPICA error reporting in order to simplify user migration**  
7663 **to**  
4095 *Enhanced the ACPICA error reporting in order to simplify user migration to*  
7664 the non-debug version of ACPICA. Replaced all instances of the  
7665 **ACPI\_DEBUG\_PRINT macro invoked at the ACPI\_DB\_ERROR and ACPI\_DB\_WARN**  
7666 **debug**  
4097 *ACPI\_DEBUG\_PRINT macro invoked at the ACPI\_DB\_ERROR and ACPI\_DB\_WARN debug*  
7667 levels with the ACPI\_REPORT\_ERROR and ACPI\_REPORT\_WARNING macros,  
7668 **respectively. This preserves all error and warning messages in the non-**  
7669 **debug**  
4099 *respectively. This preserves all error and warning messages in the non-debug*  
7670 version of the ACPICA code (this has been referred to as the "debug lite"  
7671 option.) Over 200 cases were converted to create a total of over 380  
7672 **error/warning messages across the ACPICA code. This increases the code**  
7673 **and**  
7674 **data size of the default non-debug version of the code somewhat (about**  
7675 **13K),**  
4102 *error/warning messages across the ACPICA code. This increases the code and*  
4103 *data size of the default non-debug version of the code somewhat (about 13K),*  
7676 but all error/warning reporting may be disabled if desired (and code  
7677 eliminated) by specifying the ACPI\_NO\_ERROR\_MESSAGES compile-time  
7678 **configuration option. The size of the debug version of ACPICA remains**  
7679 **about**  
4106 *configuration option. The size of the debug version of ACPICA remains about*  
7680 the same.

7682 Fixed a memory leak within the AML Debugger "Set" command. One object was  
7683 not properly deleted for every successful invocation of the command.

7685 Code and Data Size: The current and previous library sizes for the core  
7686 subsystem are shown below. These are the code and data sizes for the  
7687 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
7688 **These**  
7689 **values do not include any ACPI driver or OSPM code. The debug version of**  
7690 **the**  
4114 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
4115 *values do not include any ACPI driver or OSPM code. The debug version of the*  
7691 code includes the debug output trace mechanism and has a much larger code  
7692 **and data size. Note that these values will vary depending on the**  
7693 **efficiency**  
4117 *and data size. Note that these values will vary depending on the efficiency*  
7694 of the compiler and the compiler options used during generation.

7696	Previous Release:	
7697	Non-Debug Version:	76.6K Code, 12.3K Data, 88.9K Total
7698	Debug Version:	163.7K Code, 67.5K Data, 231.2K Total
7699	Current Release:	
7700	Non-Debug Version:	83.1K Code, 18.4K Data, 101.5K Total
7701	Debug Version:	163.2K Code, 66.2K Data, 229.4K Total

7704 2) iASL Compiler/Disassembler:

7706 The compiler now officially supports the ACPI 3.0a specification that was  
7707 **released on December 30, 2005. (Specification is available at**  
7708 **www.acpi.info)**  
4131 *released on December 30, 2005. (Specification is available at www.acpi.info)*

7710 -----  
7711 16 December 2005. Summary of changes for version 20051216:

7713 1) ACPI CA Core Subsystem:

7715 Implemented optional support to allow unresolved names within ASL Package  
 7716 objects. A null object is inserted in the package when a named reference  
 7717 cannot be located in the current namespace. Enabled via the interpreter  
 7718 **slack flag, this should eliminate AE\_NOT\_FOUND exceptions seen on**  
 7719 **machines**  
 4141 *slack flag, this should eliminate AE\_NOT\_FOUND exceptions seen on machines*  
 7720 that contain such code.

7722 Implemented an optimization to the initialization sequence that can  
 7723 improve  
 7724 boot time. During ACPI device initialization, the `_STA` method is now run  
 7725 if  
 7726 and only if the `_INI` method exists. The `_STA` method is used to determine  
 7727 if  
 7728 the device is present; An `_INI` can only be run if `_STA` returns present,  
 7729 but  
 4144 Implemented an optimization to the initialization sequence that can improve  
 4145 boot time. During ACPI device initialization, the `_STA` method is now run if  
 4146 and only if the `_INI` method exists. The `_STA` method is used to determine if  
 4147 the device is present; An `_INI` can only be run if `_STA` returns present, but  
 7730 it is a waste of time to run the `_STA` method if the `_INI` does not exist.  
 7731 (Prototype and assistance from Dong Wei)

7733 Implemented use of the C99 `uintptr_t` for the pointer casting macros if it  
 7734 is  
 7735 available in the current compiler. Otherwise, the default (void \*) cast  
 7736 is  
 4151 Implemented use of the C99 `uintptr_t` for the pointer casting macros if it is  
 4152 available in the current compiler. Otherwise, the default (void \*) cast is  
 7737 used as before.

7739 Fixed some possible memory leaks found within the execution path of the  
 7740 Break, Continue, If, and CreateField operators. (Valery Podrezov)

7742 Fixed a problem introduced in the 20051202 release where an exception is  
 7743 generated during method execution if a control method attempts to declare  
 7744 another method.

7746 Moved resource descriptor string constants that are used by both the AML  
 7747 disassembler and AML debugger to the common utilities directory so that  
 7748 these components are independent.

7750 Implemented support in the AcpiExec utility (`-e` switch) to globally  
 7751 ignore  
 4166 Implemented support in the AcpiExec utility (`-e` switch) to globally ignore  
 7752 exceptions during control method execution (method is not aborted.)

7754 Added the rsinfo.c source file to the AcpiExec makefile for Linux/Unix  
 7755 generation.

7757 Code and Data Size: The current and previous library sizes for the core  
 7758 subsystem are shown below. These are the code and data sizes for the  
 7759 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
 7760 **These**  
 7761 **values do not include any ACPI driver or OSPM code. The debug version of**  
 7762 **the**  
 4174 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
 4175 *values do not include any ACPI driver or OSPM code. The debug version of the*  
 7763 *code includes the debug output trace mechanism and has a much larger code*  
 7764 *and data size. Note that these values will vary depending on the*  
 7765 *efficiency*  
 4177 *and data size. Note that these values will vary depending on the efficiency*  
 7766 of the compiler and the compiler options used during generation.

7768 Previous Release:

7769 Non-Debug Version: 76.3K Code, 12.3K Data, 88.6K Total  
 7770 Debug Version: 163.2K Code, 67.4K Data, 230.6K Total  
 7771 Current Release:  
 7772 Non-Debug Version: 76.6K Code, 12.3K Data, 88.9K Total  
 7773 Debug Version: 163.7K Code, 67.5K Data, 231.2K Total

7776 2) iASL Compiler/Disassembler:

7778 Fixed a problem where a CPU stack overflow fault could occur if a  
 7779 recursive  
 4190 Fixed a problem where a CPU stack overflow fault could occur if a recursive  
 7780 method call was made from within a Return statement.

7782 -----

7783 02 December 2005. Summary of changes for version 20051202:

7785 1) ACPI CA Core Subsystem:

7787 Modified the parsing of control methods to no longer create namespace  
 7788 objects during the first pass of the parse. Objects are now created only  
 7789 during the execute phase, at the moment the namespace creation operator  
 7790 is  
 7791 encountered in the AML (Name, OperationRegion, CreateByteField, etc.)  
 7792 This  
 4200 during the execute phase, at the moment the namespace creation operator is  
 4201 encountered in the AML (Name, OperationRegion, CreateByteField, etc.) This  
 7793 should eliminate ALREADY\_EXISTS exceptions seen on some machines where  
 7794 reentrant control methods are protected by an AML mutex. The mutex will  
 7795 now  
 7796 correctly block multiple threads from attempting to create the same  
 7797 object  
 4203 reentrant control methods are protected by an AML mutex. The mutex will now  
 4204 correctly block multiple threads from attempting to create the same object  
 7798 more than once.

7800 Increased the number of available Owner Ids for namespace object tracking  
 7801 from 32 to 255. This should eliminate the OWNER\_ID\_LIMIT exceptions seen  
 7802 on  
 7803 some machines with a large number of ACPI tables (either static or  
 7804 dynamic).  
 4208 from 32 to 255. This should eliminate the OWNER\_ID\_LIMIT exceptions seen on  
 4209 some machines with a large number of ACPI tables (either static or dynamic).

7806 Fixed a problem with the AcpiExec utility where a fault could occur when  
 7807 the  
 4211 Fixed a problem with the AcpiExec utility where a fault could occur when the  
 7808 `-b` switch (batch mode) is used.

7810 Enhanced the namespace dump routine to output the owner ID for each  
 7811 namespace object.

7813 Code and Data Size: The current and previous library sizes for the core  
 7814 subsystem are shown below. These are the code and data sizes for the  
 7815 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
 7816 **These**  
 7817 **values do not include any ACPI driver or OSPM code. The debug version of**  
 7818 **the**  
 4219 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
 4220 *values do not include any ACPI driver or OSPM code. The debug version of the*  
 7819 *code includes the debug output trace mechanism and has a much larger code*  
 7820 *and data size. Note that these values will vary depending on the*  
 7821 *efficiency*  
 4222 *and data size. Note that these values will vary depending on the efficiency*  
 7822 of the compiler and the compiler options used during generation.

7824 Previous Release:  
 7825 Non-Debug Version: 76.3K Code, 12.3K Data, 88.6K Total  
 7826 Debug Version: 163.0K Code, 67.4K Data, 230.4K Total  
 7827 Current Release:  
 7828 Non-Debug Version: 76.3K Code, 12.3K Data, 88.6K Total  
 7829 Debug Version: 163.2K Code, 67.4K Data, 230.6K Total

7832 2) iASL Compiler/Disassembler:

7834 **Fixed a parse error during compilation of certain Switch/Case constructs.**  
 7835 **To**  
 7836 **simplify the parse, the grammar now allows for multiple Default**  
 7837 **statements**  
 4235 *Fixed a parse error during compilation of certain Switch/Case constructs. To*  
 4236 *simplify the parse, the grammar now allows for multiple Default statements*  
 7838 *and this error is now detected and flagged during the analysis phase.*

7840 Disassembler: The disassembly now includes the contents of the original  
 7841 table header within a comment at the start of the file. This includes the  
 7842 name and version of the original ASL compiler.

7844 -----  
 7845 17 November 2005. Summary of changes for version 20051117:

7847 1) ACPI CA Core Subsystem:

7849 **Fixed a problem in the AML parser where the method thread count could be**  
 7850 **decremented below zero if any errors occurred during the method parse**  
 7851 **phase.**  
 7852 **This should eliminate AE\_AML\_METHOD\_LIMIT exceptions seen on some**  
 7853 **machines.**  
 4249 *decremented below zero if any errors occurred during the method parse phase.*  
 4250 *This should eliminate AE\_AML\_METHOD\_LIMIT exceptions seen on some machines.*  
 7854 *This also fixed a related regression with the mechanism that detects and*  
 7855 *corrects methods that cannot properly handle reentrancy (related to the*  
 7856 *deployment of the new OwnerId mechanism.)*

7858 **Eliminated the pre-parsing of control methods (to detect errors) during**  
 7859 **table load. Related to the problem above, this was causing unwind issues**  
 7860 **if**  
 7861 **any errors occurred during the parse, and it seemed to be overkill. A**  
 7862 **table**  
 4256 *table load. Related to the problem above, this was causing unwind issues if*  
 4257 *any errors occurred during the parse, and it seemed to be overkill. A table*  
 7863 *load should not be aborted if there are problems with any single control*  
 7864 *method, thus rendering this feature rather pointless.*

7866 **Fixed a problem with the new table-driven resource manager where an**  
 7867 **internal**  
 4261 *Fixed a problem with the new table-driven resource manager where an internal*  
 7868 *buffer overflow could occur for small resource templates.*

7870 **Implemented a new external interface, AcpiGetVendorResource. This**  
 7871 **interface**  
 7872 **will find and return a vendor-defined resource descriptor within a \_CRS**  
 7873 **or**  
 7874 **\_PRS method via an ACPI 3.0 UUID match. With assistance from Bjorn**  
 7875 **Helgaas.**  
 4264 *Implemented a new external interface, AcpiGetVendorResource. This interface*  
 4265 *will find and return a vendor-defined resource descriptor within a \_CRS or*  
 4266 *\_PRS method via an ACPI 3.0 UUID match. With assistance from Bjorn Helgaas.*

7877 **Removed the length limit (200) on string objects as per the upcoming ACPI**  
 7878 **3.0A specification. This affects the following areas of the interpreter:**  
 7879 **1)**

7880 **any implicit conversion of a Buffer to a String, 2) a String object**  
 7881 **result**  
 4269 *3.0A specification. This affects the following areas of the interpreter: 1)*  
 4270 *any implicit conversion of a Buffer to a String, 2) a String object result*  
 7882 *of the ASL Concatenate operator, 3) the String object result of the ASL*  
 7883 *ToString operator.*

7885 **Fixed a problem in the Windows OS interface layer (OSL) where a**  
 7886 **WAIT FOREVER**  
 4274 *Fixed a problem in the Windows OS interface layer (OSL) where a WAIT\_FOREVER*  
 7887 *on a semaphore object would incorrectly timeout. This allows the*  
 7888 *multithreading features of the AcpiExec utility to work properly under*  
 7889 *Windows.*

7891 Updated the Linux makefiles for the iASL compiler and AcpiExec to include  
 7892 the recently added file named "utresrc.c".

7894 **Code and Data Size: The current and previous library sizes for the core**  
 7895 **subsystem are shown below. These are the code and data sizes for the**  
 7896 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
 7897 **These**  
 7898 **values do not include any ACPI driver or OSPM code. The debug version of**  
 7899 **the**  
 4284 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
 4285 *values do not include any ACPI driver or OSPM code. The debug version of the*  
 7900 *code includes the debug output trace mechanism and has a much larger code*  
 7901 *and data size. Note that these values will vary depending on the*  
 7902 *efficiency*  
 4287 *and data size. Note that these values will vary depending on the efficiency*  
 7903 *of the compiler and the compiler options used during generation.*

7905 Previous Release:  
 7906 Non-Debug Version: 76.2K Code, 12.3K Data, 88.5K Total  
 7907 Debug Version: 163.0K Code, 67.4K Data, 230.4K Total  
 7908 Current Release:  
 7909 Non-Debug Version: 76.3K Code, 12.3K Data, 88.6K Total  
 7910 Debug Version: 163.0K Code, 67.4K Data, 230.4K Total

7913 2) iASL Compiler/Disassembler:

7915 **Removed the limit (200) on string objects as per the upcoming ACPI 3.0A**  
 7916 **specification. For the iASL compiler, this means that string literals**  
 7917 **within**  
 4301 *specification. For the iASL compiler, this means that string literals within*  
 7918 *the source ASL can be of any length.*

7920 **Enhanced the listing output to dump the AML code for resource descriptors**  
 7921 **immediately after the ASL code for each descriptor, instead of in a block**  
 7922 **at**  
 4305 *immediately after the ASL code for each descriptor, instead of in a block at*  
 7923 *the end of the entire resource template.*

7925 **Enhanced the compiler debug output to dump the entire original parse tree**  
 7926 **constructed during the parse phase, before any transforms are applied to**  
 7927 **the**  
 4309 *constructed during the parse phase, before any transforms are applied to the*  
 7928 *tree. The transformed tree is dumped also.*

7930 -----  
 7931 02 November 2005. Summary of changes for version 20051102:

7933 1) ACPI CA Core Subsystem:

7935 **Modified the subsystem initialization sequence to improve GPE support.**  
 7936 **The**

7937 GPE initialization has been split into two parts in order to defer  
 7938 execution  
 7939 of the \_PRW methods (Power Resources for Wake) until after the hardware  
 7940 is  
 4317 Modified the subsystem initialization sequence to improve GPE support. The  
 4318 GPE initialization has been split into two parts in order to defer execution  
 4319 of the \_PRW methods (Power Resources for Wake) until after the hardware is  
 7941 fully initialized and the SCI handler is installed. This allows the \_PRW  
 7942 methods to access fields protected by the Global Lock. This will fix  
 7943 systems  
 4321 methods to access fields protected by the Global Lock. This will fix systems  
 7944 where a NO\_GLOBAL\_LOCK exception has been seen during initialization.

7946 Converted the ACPI internal object disassemble and display code within  
 7947 the  
 4324 Converted the ACPI internal object disassemble and display code within the  
 7948 AML debugger to fully table-driven operation, reducing code size and  
 7949 increasing maintainability.

7951 Fixed a regression with the ConcatenateResTemplate() ASL operator  
 7952 introduced  
 4328 Fixed a regression with the ConcatenateResTemplate() ASL operator introduced  
 7953 in the 20051021 release.

7955 Implemented support for "local" internal ACPI object types within the  
 7956 debugger "Object" command and the AcpiWalkNamespace external interfaces.  
 7957 These local types include RegionFields, BankFields, IndexFields, Alias,  
 7958 and  
 4333 These local types include RegionFields, BankFields, IndexFields, Alias, and  
 7959 reference objects.

7961 Moved common AML resource handling code into a new file, "utresrc.c".  
 7962 This  
 4336 Moved common AML resource handling code into a new file, "utresrc.c". This  
 7963 code is shared by both the Resource Manager and the AML Debugger.

7965 Code and Data Size: The current and previous library sizes for the core  
 7966 subsystem are shown below. These are the code and data sizes for the  
 7967 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.  
 7968 These  
 7969 values do not include any ACPI driver or OSPM code. The debug version of  
 7970 the  
 4341 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These  
 4342 values do not include any ACPI driver or OSPM code. The debug version of the  
 7971 code includes the debug output trace mechanism and has a much larger code  
 7972 and data size. Note that these values will vary depending on the  
 7973 efficiency  
 4344 and data size. Note that these values will vary depending on the efficiency  
 7974 of the compiler and the compiler options used during generation.

7976	Previous Release:	
7977	Non-Debug Version:	76.1K Code, 12.2K Data, 88.3K Total

7979	Current Release:	
7980	Non-Debug Version:	76.2K Code, 12.3K Data, 88.5K Total
7981	Debug Version:	163.0K Code, 67.4K Data, 230.4K Total

7984 2) iASL Compiler/Disassembler:

7986 Fixed a problem with very large initializer lists (more than 4000  
 7987 elements)  
 4357 Fixed a problem with very large initializer lists (more than 4000 elements)  
 7988 for both Buffer and Package objects where the parse stack could overflow.

7990 Enhanced the pre-compile source code scan for non-ASCII characters to

7991 ignore  
 7992 characters within comment fields. The scan is now always performed and is  
 7993 no  
 4360 Enhanced the pre-compile source code scan for non-ASCII characters to ignore  
 4361 characters within comment fields. The scan is now always performed and is no  
 7994 longer optional, detecting invalid characters within a source file  
 7995 immediately rather than during the parse phase or later.

7997 Enhanced the ASL grammar definition to force early reductions on all  
 7998 list-  
 4365 Enhanced the ASL grammar definition to force early reductions on all list-  
 7999 style grammar elements so that the overall parse stack usage is greatly  
 8000 reduced. This should improve performance and reduce the possibility of  
 8001 parse  
 4367 reduced. This should improve performance and reduce the possibility of parse  
 8002 stack overflow.

8004 Eliminated all reduce/reduce conflicts in the iASL parser generation.  
 8005 Also,  
 4370 Eliminated all reduce/reduce conflicts in the iASL parser generation. Also,  
 8006 with the addition of a %expected statement, the compiler generates from  
 8007 source with no warnings.

8009 Fixed a possible segment fault in the disassembler if the input filename  
 8010 does not contain a "dot" extension (Thomas Renninger).

8012 -----  
 8013 21 October 2005. Summary of changes for version 20051021:

8015 1) ACPI CA Core Subsystem:

8017 Implemented support for the EM64T and other x86-64 processors. This  
 8018 essentially entails recognizing that these processors support non-aligned  
 8019 memory transfers. Previously, all 64-bit processors were assumed to lack  
 8020 hardware support for non-aligned transfers.

8022 Completed conversion of the Resource Manager to nearly full table-driven  
 8023 operation. Specifically, the resource conversion code (convert AML to  
 8024 internal format and the reverse) and the debug code to dump internal  
 8025 resource descriptors are fully table-driven, reducing code and data size  
 8026 and  
 4390 resource descriptors are fully table-driven, reducing code and data size and  
 8027 improving maintainability.

8029 The OSL interfaces for Acquire and Release Lock now use a 64-bit flag  
 8030 word  
 8031 on 64-bit processors instead of a fixed 32-bit word. (With assistance  
 8032 from  
 4393 The OSL interfaces for Acquire and Release Lock now use a 64-bit flag word  
 4394 on 64-bit processors instead of a fixed 32-bit word. (With assistance from  
 8033 Alexey Starikovskiy)

8035 Implemented support within the resource conversion code for the Type-  
 8036 Specific byte within the various ACPI 3.0 \*WordSpace macros.

8038 Fixed some issues within the resource conversion code for the type-  
 8039 specific  
 4400 Fixed some issues within the resource conversion code for the type-specific  
 8040 flags for both Memory and I/O address resource descriptors. For Memory,  
 8041 implemented support for the MTP and TTP flags. For I/O, split the TRS and  
 8042 TTP flags into two separate fields.

8044 Code and Data Size: The current and previous library sizes for the core  
 8045 subsystem are shown below. These are the code and data sizes for the  
 8046 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.  
 8047 These

8048 values do not include any ACPI driver or OSPM code. The debug version of  
 8049 the  
 4407 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These  
 4408 values do not include any ACPI driver or OSPM code. The debug version of the  
 8050 code includes the debug output trace mechanism and has a much larger code  
 8051 and data size. Note that these values will vary depending on the  
 8052 efficiency  
 4410 and data size. Note that these values will vary depending on the efficiency  
 8053 of the compiler and the compiler options used during generation.

8055 Previous Release:  
 8056 Non-Debug Version: 77.1K Code, 12.1K Data, 89.2K Total  
 8057 Debug Version: 168.0K Code, 68.3K Data, 236.3K Total  
 8058 Current Release:  
 8059 Non-Debug Version: 76.1K Code, 12.2K Data, 88.3K Total  
 8060 Debug Version: 163.5K Code, 67.0K Data, 230.5K Total

#### 8064 2) iASL Compiler/Disassembler:

8066 Relaxed a compiler restriction that disallowed a ResourceIndex byte if  
 8067 the  
 4424 Relaxed a compiler restriction that disallowed a ResourceIndex byte if the  
 8068 corresponding ResourceSource string was not also present in a resource  
 8069 descriptor declaration. This restriction caused problems with existing  
 8070 AML/ASL code that includes the Index byte without the string. When such  
 8071 AML  
 4427 AML/ASL code that includes the Index byte without the string. When such AML  
 8072 was disassembled, it could not be compiled without modification. Further,  
 8073 the modified code created a resource template with a different size than  
 8074 the  
 8075 original, breaking code that used fixed offsets into the resource  
 8076 template  
 4429 the modified code created a resource template with a different size than the  
 4430 original, breaking code that used fixed offsets into the resource template  
 8077 buffer.

8079 Removed a recent feature of the disassembler to ignore a lone  
 8080 ResourceIndex  
 4433 Removed a recent feature of the disassembler to ignore a lone ResourceIndex  
 8081 byte. This byte is now emitted if present so that the exact AML can be  
 8082 reproduced when the disassembled code is recompiled.

8084 Improved comments and text alignment for the resource descriptor code  
 8085 emitted by the disassembler.

8087 Implemented disassembler support for the ACPI 3.0 AccessSize field within  
 8088 a  
 4440 Implemented disassembler support for the ACPI 3.0 AccessSize field within a  
 8089 Register() resource descriptor.

8091 -----

8092 30 September 2005. Summary of changes for version 20050930:

#### 8094 1) ACPI CA Core Subsystem:

8096 Completed a major overhaul of the Resource Manager code - specifically,  
 8097 optimizations in the area of the AML/internal resource conversion code.  
 8098 The  
 8099 code has been optimized to simplify and eliminate duplicated code, CPU  
 8100 stack  
 4449 optimizations in the area of the AML/internal resource conversion code. The  
 4450 code has been optimized to simplify and eliminate duplicated code, CPU stack  
 8101 use has been decreased by optimizing function parameters and local  
 8102 variables, and naming conventions across the manager have been

8103 standardized  
 4452 variables, and naming conventions across the manager have been standardized  
 8104 for clarity and ease of maintenance (this includes function, parameter,  
 8105 variable, and struct/typedef names.) The update may force changes in some  
 8106 driver code, depending on how resources are handled by the host OS.

8108 All Resource Manager dispatch and information tables have been moved to a  
 8109 single location for clarity and ease of maintenance. One new file was  
 8110 created, named "rsinfo.c".

8112 The ACPI return macros (return\_ACPI\_STATUS, etc.) have been modified to  
 8113 guarantee that the argument is not evaluated twice, making them less  
 8114 prone  
 4462 guarantee that the argument is not evaluated twice, making them less prone  
 8115 to macro side-effects. However, since there exists the possibility of  
 8116 additional stack use if a particular compiler cannot optimize them (such  
 8117 as  
 8118 in the debug generation case), the original macros are optionally  
 8119 available.  
 4464 additional stack use if a particular compiler cannot optimize them (such as  
 4465 in the debug generation case), the original macros are optionally available.  
 8120 Note that some invocations of the return\_VALUE macro may now cause size  
 8121 mismatch warnings; the return\_UINT8 and return\_UINT32 macros are provided  
 8122 to  
 4467 mismatch warnings; the return\_UINT8 and return\_UINT32 macros are provided to  
 8123 eliminate these. (From Randy Dunlap)

8125 Implemented a new mechanism to enable debug tracing for individual  
 8126 control  
 4470 Implemented a new mechanism to enable debug tracing for individual control  
 8127 methods. A new external interface, AcpiDebugTrace, is provided to enable  
 8128 this mechanism. The intent is to allow the host OS to easily enable and  
 8129 disable tracing for problematic control methods. This interface can be  
 8130 easily exposed to a user or debugger interface if desired. See the file  
 8131 psxfac.c for details.

8133 AcpiUtCalloc will now return a valid pointer if a length of zero is  
 8134 specified - a length of one is used and a warning is issued. This matches  
 8135 the behavior of AcpiUtAllocate.

8137 Code and Data Size: The current and previous library sizes for the core  
 8138 subsystem are shown below. These are the code and data sizes for the  
 8139 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.  
 8140 These  
 8141 values do not include any ACPI driver or OSPM code. The debug version of  
 8142 the  
 4483 acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These  
 4484 values do not include any ACPI driver or OSPM code. The debug version of the  
 8143 code includes the debug output trace mechanism and has a much larger code  
 8144 and data size. Note that these values will vary depending on the  
 8145 efficiency  
 4486 and data size. Note that these values will vary depending on the efficiency  
 8146 of the compiler and the compiler options used during generation.

8148 Previous Release:  
 8149 Non-Debug Version: 77.5K Code, 12.0K Data, 89.5K Total  
 8150 Debug Version: 168.1K Code, 68.4K Data, 236.5K Total  
 8151 Current Release:  
 8152 Non-Debug Version: 77.1K Code, 12.1K Data, 89.2K Total  
 8153 Debug Version: 168.0K Code, 68.3K Data, 236.3K Total

#### 8156 2) iASL Compiler/Disassembler:

8158 A remark is issued if the effective compile-time length of a package or  
 8159 buffer is zero. Previously, this was a warning.

8161 -----  
 8162 16 September 2005. Summary of changes for version 20050916:

8164 1) ACPI CA Core Subsystem:

8166 Fixed a problem within the Resource Manager where support for the Generic  
 8167 **Register descriptor was not fully implemented. This descriptor is now**  
 8168 **fully**  
 4508 *Register descriptor was not fully implemented. This descriptor is now fully*  
 8169 recognized, parsed, disassembled, and displayed.

8171 Completely restructured the Resource Manager code to utilize table-driven  
 8172 **dispatch and lookup, eliminating many of the large switch() statements.**  
 8173 **This**  
 4512 *dispatch and lookup, eliminating many of the large switch() statements. This*  
 8174 reduces overall subsystem code size and code complexity. Affects the  
 8175 resource parsing and construction, disassembly, and debug dump output.

8177 Cleaned up and restructured the debug dump output for all resource  
 8178 descriptors. Improved readability of the output and reduced code size.

8180 Fixed a problem where changes to internal data structures caused the  
 8181 optional ACPI\_MUTEX\_DEBUG code to fail compilation if specified.

8183 Code and Data Size: The current and previous library sizes for the core  
 8184 subsystem are shown below. These are the code and data sizes for the  
 8185 **acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler.**  
 8186 **These**  
 8187 **values do not include any ACPI driver or OSPM code. The debug version of**  
 8188 **the**  
 4524 *acpica.lib produced by the Microsoft Visual C++ 6.0 32-bit compiler. These*  
 4525 *values do not include any ACPI driver or OSPM code. The debug version of the*  
 8189 code includes the debug output trace mechanism and has a much larger code  
 8190 **and data size. Note that these values will vary depending on the**  
 8191 **efficiency**  
 4527 *and data size. Note that these values will vary depending on the efficiency*  
 8192 of the compiler and the compiler options used during generation.

8194	Previous Release:	
8195	Non-Debug Version:	78.4K Code, 11.8K Data, 90.2K Total
8196	Debug Version:	169.6K Code, 69.9K Data, 239.5K Total
8197	Current Release:	
8198	Non-Debug Version:	77.5K Code, 12.0K Data, 89.5K Total
8199	Debug Version:	168.1K Code, 68.4K Data, 236.5K Total

8202 2) iASL Compiler/Disassembler:

8204 **Updated the disassembler to automatically insert an EndDependentFn()**  
 8205 **macro**  
 4540 *Updated the disassembler to automatically insert an EndDependentFn() macro*  
 8206 into the ASL stream if this macro is missing in the original AML code,  
 8207 simplifying compilation of the resulting ASL module.

8209 Fixed a problem in the disassembler where a disassembled ResourceSource  
 8210 **string (within a large resource descriptor) was not surrounded by quotes**  
 8211 **and**  
 4545 *string (within a large resource descriptor) was not surrounded by quotes and*  
 8212 not followed by a comma, causing errors when the resulting ASL module was  
 8213 compiled. Also, escape sequences within a ResourceSource string are now  
 8214 handled correctly (especially "\\")

8216 -----  
 8217 02 September 2005. Summary of changes for version 20050902:

8219 1) ACPI CA Core Subsystem:

8221 Fixed a problem with the internal Owner ID allocation and deallocation  
 8222 mechanisms for control method execution and recursive method invocation.  
 8223 This should eliminate the OWNER\_ID\_LIMIT exceptions and "Invalid OwnerId"  
 8224 messages seen on some systems. Recursive method invocation depth is  
 8225 currently limited to 255. (Alexey Starikovskiy)

8227 Completely eliminated all vestiges of support for the "module-level  
 8228 **executable code" until this support is fully implemented and debugged.**  
 8229 **This**  
 4562 *executable code" until this support is fully implemented and debugged. This*  
 8230 should eliminate the NO\_RETURN\_VALUE exceptions seen during table load on  
 8231 some systems that invoke this support.

8233 **Fixed a problem within the resource manager code where the transaction**  
 8234 **flags**  
 4566 *Fixed a problem within the resource manager code where the transaction flags*  
 8235 for a 64-bit address descriptor were handled incorrectly in the type-  
 8236 specific flag byte.

8238 **Consolidated duplicate code within the address descriptor resource**  
 8239 **manager**  
 4570 *Consolidated duplicate code within the address descriptor resource manager*  
 8240 code, reducing overall subsystem code size.

8242 Fixed a fault when using the AML debugger "disassemble" command to  
 8243 disassemble individual control methods.

8245 Removed references to the "release\_current" directory within the Unix  
 8246 release package.

8248 Code and Data Size: The current and previous core subsystem library sizes  
 8249 are shown below. These are the code and data sizes for the acpica.lib  
 8250 produced by the Microsoft Visual C++ 6.0 compiler. These values do not  
 8251 **include any ACPI driver or OSPM code. The debug version of the code**  
 8252 **includes**  
 8253 **the debug output trace mechanism and has a much larger code and data**  
 8254 **size.**  
 8255 **Note that these values will vary depending on the efficiency of the**  
 8256 **compiler**  
 4582 *include any ACPI driver or OSPM code. The debug version of the code includes*  
 4583 *the debug output trace mechanism and has a much larger code and data size.*  
 4584 *Note that these values will vary depending on the efficiency of the compiler*  
 8257 and the compiler options used during generation.

8259	Previous Release:	
8260	Non-Debug Version:	78.6K Code, 11.7K Data, 90.3K Total
8261	Debug Version:	170.0K Code, 69.9K Data, 239.9K Total
8262	Current Release:	
8263	Non-Debug Version:	78.4K Code, 11.8K Data, 90.2K Total
8264	Debug Version:	169.6K Code, 69.9K Data, 239.5K Total

8267 2) iASL Compiler/Disassembler:

8269 **Implemented an error check for illegal duplicate values in the interrupt**  
 8270 **and**  
 4597 *Implemented an error check for illegal duplicate values in the interrupt and*  
 8271 dma lists for the following ASL macros: Dma(), Irq(), IrqNoFlags(), and  
 8272 Interrupt().

8274 **Implemented error checking for the Irq() and IrqNoFlags() macros to**  
 8275 **detect**  
 4601 *Implemented error checking for the Irq() and IrqNoFlags() macros to detect*  
 8276 too many values in the interrupt list (16 max) and invalid values in the

8277 list (range 0 - 15)

8279 The maximum length string literal within an ASL file is now restricted to  
8280 200 characters as per the ACPI specification.

8282 Fixed a fault when using the -ln option (generate namespace listing).

8284 Implemented an error check to determine if a DescriptorName within a  
8285 resource descriptor has already been used within the current scope.

8287 -----  
8288 15 August 2005. Summary of changes for version 20050815:  
8289  
8290 1) ACPI CA Core Subsystem:  
8291  
8292 **Implemented a full bitwise compare to determine if a table load request**  
8293 **is attempting to load a duplicate table. The compare is performed if the**  
8294 **table**  
8295 *Implemented a full bitwise compare to determine if a table load request is*  
8296 *attempting to load a duplicate table. The compare is performed if the table*  
8297 *signatures and table lengths match. This will allow different tables with*  
8298 *the same OEM Table ID and revision to be loaded - probably against the*  
8299 *ACPI*  
8300 *the same OEM Table ID and revision to be loaded - probably against the ACPI*  
8301 *specification, but discovered in the field nonetheless.*  
8302  
8303 Added the changes.txt logfile to each of the zipped release packages.  
8304  
8305 Code and Data Size: Current and previous core subsystem library sizes are  
8306 **shown below. These are the code and data sizes for the acpica.lib**  
8307 **produced**  
8308 *shown below. These are the code and data sizes for the acpica.lib produced*  
8309 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
8310 *any ACPI driver or OSPM code. The debug version of the code includes the*  
8311 *debug output trace mechanism and has a much larger code and data size.*  
8312 **Note**  
8313 **that these values will vary depending on the efficiency of the compiler**  
8314 **and**  
8315 *debug output trace mechanism and has a much larger code and data size. Note*  
8316 *that these values will vary depending on the efficiency of the compiler and*  
8317 *the compiler options used during generation.*  
8318  
8319 Previous Release:  
8320 Non-Debug Version: 78.6K Code, 11.7K Data, 90.3K Total  
8321 Debug Version: 167.0K Code, 69.9K Data, 236.9K Total  
8322 Current Release:  
8323 Non-Debug Version: 78.6K Code, 11.7K Data, 90.3K Total  
8324 Debug Version: 170.0K Code, 69.9K Data, 239.9K Total  
8325  
8326 2) iASL Compiler/Disassembler:  
8327  
8328 Fixed a problem where incorrect AML code could be generated for Package  
8329 objects if optimization is disabled (via the -oa switch).  
8330  
8331 Fixed a problem with where incorrect AML code is generated for variable-  
8332 **length packages when the package length is not specified and the number**  
8333 **of**  
8334 *length packages when the package length is not specified and the number of*  
8335 *initializer values is greater than 255.*  
8336  
8337 -----  
8338 29 July 2005. Summary of changes for version 20050729:

8336 1) ACPI CA Core Subsystem:

8338 **Implemented support to ignore an attempt to install/load a particular**  
8339 **ACPI**  
8340 *Implemented support to ignore an attempt to install/load a particular ACPI*  
8341 *table more than once. Apparently there exists BIOS code that repeatedly*  
8342 *attempts to load the same SSDT upon certain events. With assistance from*  
8343 *Venkatesh Pallipadi.*  
8344  
8345 Restructured the main interface to the AML parser in order to correctly  
8346 **handle all exceptional conditions. This will prevent leakage of the**  
8347 **OwnerId**  
8348 **resource and should eliminate the AE\_OWNER\_ID\_LIMIT exceptions seen on**  
8349 **some**  
8350 *handle all exceptional conditions. This will prevent leakage of the OwnerId*  
8351 *resource and should eliminate the AE\_OWNER\_ID\_LIMIT exceptions seen on some*  
8352 *machines. With assistance from Alexey Starikovskiy.*  
8353  
8354 Support for "module level code" has been disabled in this version due to  
8355 **a**  
8356 **number of issues that have appeared on various machines. The support can**  
8357 **be**  
8358 *Support for "module level code" has been disabled in this version due to a*  
8359 *number of issues that have appeared on various machines. The support can be*  
8360 *enabled by defining ACPI\_ENABLE\_MODULE\_LEVEL\_CODE during subsystem*  
8361 *compilation. When the issues are fully resolved, the code will be enabled*  
8362 *by*  
8363 *compilation. When the issues are fully resolved, the code will be enabled by*  
8364 *default again.*  
8365  
8366 Modified the internal functions for debug print support to define the  
8367 **FunctionName** parameter as a (const char \*) for compatibility with  
8368 **compiler**  
8369 *FunctionName* parameter as a (const char \*) for compatibility with compiler  
8370 built-in macros such as \_\_FUNCTION\_\_, etc.  
8371  
8372 Linted the entire ACPICA source tree for both 32-bit and 64-bit.  
8373  
8374 **Implemented support to display an object count summary for the AML**  
8375 **Debugger**  
8376 *Implemented support to display an object count summary for the AML Debugger*  
8377 *commands Object and Methods.*  
8378  
8379 Code and Data Size: Current and previous core subsystem library sizes are  
8380 **shown below. These are the code and data sizes for the acpica.lib**  
8381 **produced**  
8382 *shown below. These are the code and data sizes for the acpica.lib produced*  
8383 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
8384 *any ACPI driver or OSPM code. The debug version of the code includes the*  
8385 *debug output trace mechanism and has a much larger code and data size.*  
8386 **Note**  
8387 **that these values will vary depending on the efficiency of the compiler**  
8388 **and**  
8389 *debug output trace mechanism and has a much larger code and data size. Note*  
8390 *that these values will vary depending on the efficiency of the compiler and*  
8391 *the compiler options used during generation.*  
8392  
8393 Previous Release:  
8394 Non-Debug Version: 78.6K Code, 11.6K Data, 90.2K Total  
8395 Debug Version: 170.0K Code, 69.7K Data, 239.7K Total  
8396 Current Release:  
8397 Non-Debug Version: 78.6K Code, 11.7K Data, 90.3K Total  
8398 Debug Version: 167.0K Code, 69.9K Data, 236.9K Total

8390 2) iASL Compiler/Disassembler:

8392 Fixed a regression that appeared in the 20050708 version of the compiler  
 8393 **where an error message was inadvertently emitted for invocations of the**  
 8394 **\_OSI**  
 4701 *where an error message was inadvertently emitted for invocations of the \_OSI*  
 8395 reserved control method.

8397 -----  
 8398 08 July 2005. Summary of changes for version 20050708:

8400 1) ACPI CA Core Subsystem:

8402 The use of the CPU stack in the debug version of the subsystem has been  
 8403 considerably reduced. Previously, a debug structure was declared in every  
 8404 function that used the debug macros. This structure has been removed in  
 8405 favor of declaring the individual elements as parameters to the debug  
 8406 **functions. This reduces the cumulative stack use during nested execution**  
 8407 **of**  
 8408 **ACPI function calls at the cost of a small increase in the code size of**  
 8409 **the**  
 8410 **debug version of the subsystem. With assistance from Alexey Starikovskiy**  
 8411 **and**  
 4713 *functions. This reduces the cumulative stack use during nested execution of*  
 4714 *ACPI function calls at the cost of a small increase in the code size of the*  
 4715 *debug version of the subsystem. With assistance from Alexey Starikovskiy and*  
 8412 Len Brown.

8414 Added the ACPI\_GET\_FUNCTION\_NAME macro to enable the compiler-dependent  
 8415 headers to define a macro that will return the current function name at  
 8416 **runtime (such as \_\_FUNCTION\_\_ or \_\_func\_\_, etc.) The function name is used**  
 8417 **by**  
 4720 *runtime (such as \_\_FUNCTION\_\_ or \_\_func\_\_, etc.) The function name is used by*  
 8418 *the debug trace output. If ACPI\_GET\_FUNCTION\_NAME is not defined in the*  
 8419 **compiler-dependent header, the function name is saved on the CPU stack**  
 8420 **(one**  
 4722 *compiler-dependent header, the function name is saved on the CPU stack (one*  
 8421 *pointer per function.) This mechanism is used because apparently there*  
 8422 **exists no standard ANSI-C defined macro that that returns the function**  
 8423 **name.**  
 4724 *exists no standard ANSI-C defined macro that that returns the function name.*

8425 Redesigned and reimplemented the "Owner ID" mechanism used to track  
 8426 namespace objects created/deleted by ACPI tables and control method  
 8427 **execution. A bitmap is now used to allocate and free the IDs, thus**  
 8428 **solving**  
 8429 **the wraparound problem present in the previous implementation. The size**  
 8430 **of**  
 4728 *execution. A bitmap is now used to allocate and free the IDs, thus solving*  
 4729 *the wraparound problem present in the previous implementation. The size of*  
 8431 *the namespace node descriptor was reduced by 2 bytes as a result (Alexey*  
 8432 *Starikovskiy).*

8434 **Removed the UINT32\_BIT and UINT16\_BIT types that were used for the**  
 8435 **bitfield**  
 4733 *Removed the UINT32\_BIT and UINT16\_BIT types that were used for the bitfield*  
 8436 *flag definitions within the headers for the predefined ACPI tables. These*  
 8437 **have been replaced by UINT8\_BIT in order to increase the code portability**  
 8438 **of**  
 4735 *have been replaced by UINT8\_BIT in order to increase the code portability of*  
 8439 *the subsystem. If the use of UINT8 remains a problem, we may be forced to*  
 8440 *eliminate bitfields entirely because of a lack of portability.*

8442 **Enhanced the performance of the AcpiUtUpdateObjectReference procedure.**  
 8443 **This**  
 8444 **is a frequently used function and this improvement increases the**  
 8445 **performance**

4739 *Enhanced the performance of the AcpiUtUpdateObjectReference procedure. This*  
 4740 *is a frequently used function and this improvement increases the performance*  
 8446 *of the entire subsystem (Alexey Starikovskiy).*

8448 Fixed several possible memory leaks and the inverse - premature object  
 8449 deletion (Alexey Starikovskiy).

8451 Code and Data Size: Current and previous core subsystem library sizes are  
 8452 **shown below. These are the code and data sizes for the acpica.lib**  
 8453 **produced**  
 4747 *shown below. These are the code and data sizes for the acpica.lib produced*  
 8454 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 8455 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 8456 **debug output trace mechanism and has a much larger code and data size.**  
 8457 **Note**  
 8458 **that these values will vary depending on the efficiency of the compiler**  
 8459 **and**  
 4750 *debug output trace mechanism and has a much larger code and data size. Note*  
 4751 *that these values will vary depending on the efficiency of the compiler and*  
 8460 *the compiler options used during generation.*

8462 Previous Release:  
 8463 Non-Debug Version: 78.6K Code, 11.5K Data, 90.1K Total  
 8464 Debug Version: 165.2K Code, 69.6K Data, 234.8K Total  
 8465 Current Release:  
 8466 Non-Debug Version: 78.6K Code, 11.6K Data, 90.2K Total  
 8467 Debug Version: 170.0K Code, 69.7K Data, 239.7K Total

8469 -----  
 8470 24 June 2005. Summary of changes for version 20050624:

8472 1) ACPI CA Core Subsystem:

8474 Modified the new OSL cache interfaces to use ACPI\_CACHE\_T as the type for  
 8475 **the host-defined cache object. This allows the OSL implementation to**  
 8476 **define**  
 4767 *the host-defined cache object. This allows the OSL implementation to define*  
 8477 *and type this object in any manner desired, simplifying the OSL*  
 8478 *implementation. For example, ACPI\_CACHE\_T is defined as kmem\_cache\_t for*  
 8479 *Linux, and should be defined in the OS-specific header file for other*  
 8480 *operating systems as required.*

8482 Changed the interface to AcpiOsAcquireObject to directly return the  
 8483 requested object as the function return (instead of ACPI\_STATUS.) This  
 8484 change was made for performance reasons, since this is the purpose of the  
 8485 interface in the first place. AcpiOsAcquireObject is now similar to the  
 8486 AcpiOsAllocate interface.

8488 **Implemented a new AML debugger command named Businfo. This command**  
 8489 **displays**  
 8490 **information about all devices that have an associate \_PRT object. The**  
 8491 **\_ADR,**  
 4779 *Implemented a new AML debugger command named Businfo. This command displays*  
 4780 *information about all devices that have an associate \_PRT object. The \_ADR,*  
 8492 *\_HID, \_UID, and \_CID are displayed for these devices.*

8494 **Modified the initialization sequence in AcpiInitializeSubsystem to call**  
 8495 **the**  
 8496 **OSL interface AcpiOsInitialize first, before any local initialization.**  
 8497 **This**  
 4783 *Modified the initialization sequence in AcpiInitializeSubsystem to call the*  
 4784 *OSL interface AcpiOsInitialize first, before any local initialization. This*  
 8498 *change was required because the global initialization now calls OSL*  
 8499 *interfaces.*

8501 **Enhanced the Dump command to display the entire contents of Package**

8502 **objects**  
 4788 *Enhanced the Dump command to display the entire contents of Package objects*  
 8503 (including all sub-objects and their values.)

8505 Restructured the code base to split some files because of size and/or  
 8506 **because the code logically belonged in a separate file. New files are**  
 8507 **listed**  
 8508 **below. All makefiles and project files included in the ACPI CA release**  
 8509 **have**  
 4792 *because the code logically belonged in a separate file. New files are listed*  
 4793 *below. All makefiles and project files included in the ACPI CA release have*  
 8510 been updated.

8511 utilities/utcache.c /\* Local cache interfaces \*/  
 8512 utilities/utmutex.c /\* Local mutex support \*/  
 8513 utilities/utstate.c /\* State object support \*/  
 8514 interpreter/parser/psloop.c /\* Main AML parse loop \*/

8516 Code and Data Size: Current and previous core subsystem library sizes are  
 8517 **shown below. These are the code and data sizes for the acpica.lib**  
 8518 **produced**  
 4801 *shown below. These are the code and data sizes for the acpica.lib produced*  
 8519 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 8520 any ACPI driver or OSPM code. The debug version of the code includes the  
 8521 debug output trace mechanism and has a much larger code and data size.  
 8522 **Note**  
 8523 **that these values will vary depending on the efficiency of the compiler**  
 8524 **and**  
 4804 *debug output trace mechanism and has a much larger code and data size. Note*  
 4805 *that these values will vary depending on the efficiency of the compiler and*  
 8525 the compiler options used during generation.

8527 Previous Release:  
 8528 Non-Debug Version: 78.3K Code, 11.6K Data, 89.9K Total  
 8529 Debug Version: 164.0K Code, 69.1K Data, 233.1K Total  
 8530 Current Release:  
 8531 Non-Debug Version: 78.6K Code, 11.5K Data, 90.1K Total  
 8532 Debug Version: 165.2K Code, 69.6K Data, 234.8K Total

8535 2) iASL Compiler/Disassembler:

8537 **Fixed a regression introduced in version 20050513 where the use of a**  
 8538 **Package**  
 4818 *Fixed a regression introduced in version 20050513 where the use of a Package*  
 8539 object within a Case() statement caused a compile time exception. The  
 8540 original behavior has been restored (a Match() operator is emitted.)

8542 -----  
 8543 17 June 2005. Summary of changes for version 20050617:

8545 1) ACPI CA Core Subsystem:

8547 **Moved the object cache operations into the OS interface layer (OSL) to**  
 8548 **allow**  
 4827 *Moved the object cache operations into the OS interface layer (OSL) to allow*  
 8549 the host OS to handle these operations if desired (for example, the Linux  
 8550 **OSL will invoke the slab allocator). This support is optional; the**  
 8551 **compile**  
 8552 **time define ACPI\_USE\_LOCAL\_CACHE may be used to utilize the original**  
 8553 **cache**  
 4829 *OSL will invoke the slab allocator). This support is optional; the compile*  
 4830 *time define ACPI\_USE\_LOCAL\_CACHE may be used to utilize the original cache*  
 8554 code in the ACPI CA core. The new OSL interfaces are shown below. See  
 8555 utalloc.c for an example implementation, and acpiosxf.h for the exact  
 8556 interface definitions. With assistance from Alexey Starikovskiy.  
 8557 AcpiOsCreateCache

8558 AcpiOsDeleteCache  
 8559 AcpiOsPurgeCache  
 8560 AcpiOsAcquireObject  
 8561 AcpiOsReleaseObject

8563 **Modified the interfaces to AcpiOsAcquireLock and AcpiOsReleaseLock to**  
 8564 **return**  
 4840 *Modified the interfaces to AcpiOsAcquireLock and AcpiOsReleaseLock to return*  
 8565 and restore a flags parameter. This fits better with many OS lock models.  
 8566 Note: the current execution state (interrupt handler or not) is no longer  
 8567 **passed to these interfaces. If necessary, the OSL must determine this**  
 8568 **state**  
 4843 *passed to these interfaces. If necessary, the OSL must determine this state*  
 8569 by itself, a simple and fast operation. With assistance from Alexey  
 8570 Starikovskiy.

8572 Fixed a problem in the ACPI table handling where a valid XSDT was assumed  
 8573 **present if the revision of the RSDP was 2 or greater. According to the**  
 8574 **ACPI**  
 4848 *present if the revision of the RSDP was 2 or greater. According to the ACPI*  
 8575 specification, the XSDT is optional in all cases, and the table manager  
 8576 therefore now checks for both an RSDP >=2 and a valid XSDT pointer.  
 8577 **Otherwise, the RSDT pointer is used. Some ACPI 2.0 compliant BIOSs**  
 8578 **contain**  
 4851 *Otherwise, the RSDT pointer is used. Some ACPI 2.0 compliant BIOSs contain*  
 8579 only the RSDT.

8581 **Fixed an interpreter problem with the Mid() operator in the case of an**  
 8582 **input**  
 8583 **string where the resulting output string is of zero length. It now**  
 8584 **correctly**  
 4854 *Fixed an interpreter problem with the Mid() operator in the case of an input*  
 4855 *string where the resulting output string is of zero length. It now correctly*  
 8585 returns a valid, null terminated string object instead of a string object  
 8586 with a null pointer.

8588 **Fixed a problem with the control method argument handling to allow a**  
 8589 **store**  
 8590 **to an Arg object that already contains an object of type Device. The**  
 8591 **Device**  
 4859 *Fixed a problem with the control method argument handling to allow a store*  
 4860 *to an Arg object that already contains an object of type Device. The Device*  
 8592 object is now correctly overwritten. Previously, an error was returned.

8595 **Enhanced the debugger Find command to emit object values in addition to**  
 8596 **the**  
 8597 **found object pathnames. The output format is the same as the dump**  
 8598 **namespace**  
 4864 *Enhanced the debugger Find command to emit object values in addition to the*  
 4865 *found object pathnames. The output format is the same as the dump namespace*  
 8599 command.

8601 **Enhanced the debugger Set command. It now has the ability to set the**  
 8602 **value**  
 8603 **of any Named integer object in the namespace (Previously, only method**  
 8604 **locals**  
 4868 *Enhanced the debugger Set command. It now has the ability to set the value*  
 4869 *of any Named integer object in the namespace (Previously, only method locals*  
 8605 and args could be set.)

8607 Code and Data Size: Current and previous core subsystem library sizes are  
 8608 **shown below. These are the code and data sizes for the acpica.lib**  
 8609 **produced**  
 4873 *shown below. These are the code and data sizes for the acpica.lib produced*  
 8610 by the Microsoft Visual C++ 6.0 compiler, and these values do not include

8611 any ACPI driver or OSPM code. The debug version of the code includes the  
 8612 **debug output trace mechanism and has a much larger code and data size.**  
 8613 **Note**  
 8614 **that these values will vary depending on the efficiency of the compiler**  
 8615 **and**  
 8616 **debug output trace mechanism and has a much larger code and data size. Note**  
 8617 **that these values will vary depending on the efficiency of the compiler and**  
 8618 **the compiler options used during generation.**

8618	Previous Release:	
8619	Non-Debug Version:	78.1K Code, 11.6K Data, 89.7K Total
8620	Debug Version:	164.0K Code, 69.3K Data, 233.3K Total
8621	Current Release:	
8622	Non-Debug Version:	78.3K Code, 11.6K Data, 89.9K Total
8623	Debug Version:	164.0K Code, 69.1K Data, 233.1K Total

8626 2) iASL Compiler/Disassembler:

8628 **Fixed a regression in the disassembler where if/else/while constructs**  
 8629 **were**  
 8630 **Fixed a regression in the disassembler where if/else/while constructs were**  
 8631 **output incorrectly. This problem was introduced in the previous release**  
 8632 **(20050526). This problem also affected the single-step disassembly in the**  
 8633 **debugger.**

8634 **Fixed a problem where compiling the reserved \_OSI method would randomly**  
 8635 **(but**  
 8636 **Fixed a problem where compiling the reserved \_OSI method would randomly (but**  
 8637 **rarely) produce compile errors.**

8638 **Enhanced the disassembler to emit compilable code in the face of**  
 8639 **incorrect**  
 8640 **Enhanced the disassembler to emit compilable code in the face of incorrect**  
 8641 **AML resource descriptors. If the optional ResourceSourceIndex is present,**  
 8642 **but the ResourceSource is not, do not emit the ResourceSourceIndex in the**  
 8643 **disassembly. Otherwise, the resulting code cannot be compiled without**  
 8644 **errors.**

8645 -----  
 8646 26 May 2005. Summary of changes for version 20050526:

8648 1) ACPI CA Core Subsystem:

8650 Implemented support to execute Type 1 and Type 2 AML opcodes appearing at  
 8651 **the module level (not within a control method.) These opcodes are**  
 8652 **executed**  
 8653 **exactly once at the time the table is loaded. This type of code was legal**  
 8654 **up**  
 8655 **until the release of ACPI 2.0B (2002) and is now supported within ACPI CA**  
 8656 **in**  
 8657 **order to provide backwards compatibility with earlier BIOS**  
 8658 **implementations.**  
 8659 **the module level (not within a control method.) These opcodes are executed**  
 8660 **exactly once at the time the table is loaded. This type of code was legal up**  
 8661 **until the release of ACPI 2.0B (2002) and is now supported within ACPI CA in**  
 8662 **order to provide backwards compatibility with earlier BIOS implementations.**  
 8663 **This eliminates the "Encountered executable code at module level" warning**  
 8664 **that was previously generated upon detection of such code.**

8662 Fixed a problem in the interpreter where an AE\_NOT\_FOUND exception could  
 8663 inadvertently be generated during the lookup of namespace objects in the  
 8664 **second pass parse of ACPI tables and control methods. It appears that**  
 8665 **this**  
 8666 **problem could occur during the resolution of forward references to**  
 8667 **namespace**

4919 **second pass parse of ACPI tables and control methods. It appears that this**  
 4920 **problem could occur during the resolution of forward references to namespace**  
 8668 **objects.**

8670 Added the ACPI\_MUTEX\_DEBUG #ifdef to the AcpiUtReleaseMutex function,  
 8671 corresponding to the same #ifdef in the AcpiUtAcquireMutex function. This  
 8672 allows the deadlock detection debug code to be compiled out in the normal  
 8673 case, improving mutex performance (and overall subsystem performance)  
 8674 considerably.

8676 Implemented a handful of miscellaneous fixes for possible memory leaks on  
 8677 error conditions and error handling control paths. These fixes were  
 8678 suggested by FreeBSD and the Coverity Prevent source code analysis tool.

8680 **Added a check for a null RSDT pointer in AcpiGetFirmwareTable**  
 8681 **(tbxfroot.c)**  
 4933 **Added a check for a null RSDT pointer in AcpiGetFirmwareTable (tbxfroot.c)**  
 8682 **to prevent a fault in this error case.**

8684 Code and Data Size: Current and previous core subsystem library sizes are  
 8685 **shown below. These are the code and data sizes for the acpica.lib**  
 8686 **produced**  
 4937 **shown below. These are the code and data sizes for the acpica.lib produced**  
 8687 **by the Microsoft Visual C++ 6.0 compiler, and these values do not include**  
 8688 **any ACPI driver or OSPM code. The debug version of the code includes the**  
 8689 **debug output trace mechanism and has a much larger code and data size.**  
 8690 **Note**  
 8691 **that these values will vary depending on the efficiency of the compiler**  
 8692 **and**  
 4940 **debug output trace mechanism and has a much larger code and data size. Note**  
 4941 **that these values will vary depending on the efficiency of the compiler and**  
 8693 **the compiler options used during generation.**

8695	Previous Release:	
8696	Non-Debug Version:	78.2K Code, 11.6K Data, 89.8K Total
8697	Debug Version:	163.7K Code, 69.3K Data, 233.0K Total
8698	Current Release:	
8699	Non-Debug Version:	78.1K Code, 11.6K Data, 89.7K Total
8700	Debug Version:	164.0K Code, 69.3K Data, 233.3K Total

8703 2) iASL Compiler/Disassembler:

8705 Implemented support to allow Type 1 and Type 2 ASL operators to appear at  
 8706 the module level (not within a control method.) These operators will be  
 8707 **executed once at the time the table is loaded. This type of code was**  
 8708 **legal**  
 4956 **executed once at the time the table is loaded. This type of code was legal**  
 8709 **up until the release of ACPI 2.0B (2002) and is now supported by the iASL**  
 8710 **compiler in order to provide backwards compatibility with earlier BIOS**  
 8711 **ASL**  
 4958 **compiler in order to provide backwards compatibility with earlier BIOS ASL**  
 8712 **code.**

8714 The ACPI integer width (specified via the table revision ID or the -r  
 8715 **override, 32 or 64 bits) is now used internally during compile-time**  
 8716 **constant**  
 4962 **override, 32 or 64 bits) is now used internally during compile-time constant**  
 8717 **folding to ensure that constants are truncated to 32 bits if necessary.**  
 8718 **Previously, the revision ID value was only emitted in the AML table**  
 8719 **header.**  
 4964 **Previously, the revision ID value was only emitted in the AML table header.**

8721 **An error message is now generated for the Mutex and Method operators if**  
 8722 **the**  
 4966 **An error message is now generated for the Mutex and Method operators if the**

8723 SyncLevel parameter is outside the legal range of 0 through 15.

8725 **Fixed a problem with the Method operator ParameterTypes list handling**  
 8726 **(ACPI**  
 8727 **3.0). Previously, more than 2 types or 2 arguments generated a syntax**  
 8728 **error.**  
 4969 *Fixed a problem with the Method operator ParameterTypes list handling (ACPI*  
 4970 *3.0). Previously, more than 2 types or 2 arguments generated a syntax error.*  
 8729 The actual underlying implementation of method argument typechecking is  
 8730 still under development, however.

8732 -----  
 8733 13 May 2005. Summary of changes for version 20050513:

8735 1) ACPI CA Core Subsystem:

8737 **Implemented support for PCI Express root bridges -- added support for**  
 8738 **device**  
 4979 *Implemented support for PCI Express root bridges -- added support for device*  
 8739 *PNP0A08 in the root bridge search within AcpiEvPciConfigRegionSetup.*

8741 **The interpreter now automatically truncates incoming 64-bit constants to**  
 8742 **32**  
 8743 **bits if currently executing out of a 32-bit ACPI table (Revision < 2).**  
 8744 **This**  
 4982 *The interpreter now automatically truncates incoming 64-bit constants to 32*  
 4983 *bits if currently executing out of a 32-bit ACPI table (Revision < 2). This*  
 8745 *also affects the iASL compiler constant folding. (Note: as per below, the*  
 8746 *iASL compiler no longer allows 64-bit constants within 32-bit tables.)*

8748 Fixed a problem where string and buffer objects with "static" pointers  
 8749 (pointers to initialization data within an ACPI table) were not handled  
 8750 **consistently. The internal object copy operation now always copies the**  
 8751 **data**  
 4989 *consistently. The internal object copy operation now always copies the data*  
 8752 *to a newly allocated buffer, regardless of whether the source object is*  
 8753 *static or not.*

8755 Fixed a problem with the FromBCD operator where an implicit result  
 8756 **conversion was improperly performed while storing the result to the**  
 8757 **target**  
 4994 *conversion was improperly performed while storing the result to the target*  
 8758 *operand. Since this is an "explicit conversion" operator, the implicit*  
 8759 *conversion should never be performed on the output.*

8761 Fixed a problem with the CopyObject operator where a copy to an existing  
 8762 **named object did not always completely overwrite the existing object**  
 8763 **stored**  
 8764 **at name. Specifically, a buffer-to-buffer copy did not delete the**  
 8765 **existing**  
 4999 *named object did not always completely overwrite the existing object stored*  
 5000 *at name. Specifically, a buffer-to-buffer copy did not delete the existing*  
 8766 *buffer.*

8768 **Replaced "InterruptLevel" with "InterruptNumber" in all GPE interfaces**  
 8769 **and**  
 5003 *Replaced "InterruptLevel" with "InterruptNumber" in all GPE interfaces and*  
 8770 *structs for consistency.*

8772 Code and Data Size: Current and previous core subsystem library sizes are  
 8773 **shown below. These are the code and data sizes for the acpica.lib**  
 8774 **produced**  
 5007 *shown below. These are the code and data sizes for the acpica.lib produced*  
 8775 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 8776 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 8777 *debug output trace mechanism and has a much larger code and data size.*

8778 **Note**  
 8779 **that these values will vary depending on the efficiency of the compiler**  
 8780 **and**  
 5010 *debug output trace mechanism and has a much larger code and data size. Note*  
 5011 *that these values will vary depending on the efficiency of the compiler and*  
 8781 *the compiler options used during generation.*

8783 Previous Release:  
 8784 Non-Debug Version: 78.2K Code, 11.6K Data, 89.8K Total  
 8785 Debug Version: 163.7K Code, 69.3K Data, 233.0K Total  
 8786 Current Release: (Same sizes)  
 8787 Non-Debug Version: 78.2K Code, 11.6K Data, 89.8K Total  
 8788 Debug Version: 163.7K Code, 69.3K Data, 233.0K Total

8791 2) iASL Compiler/Disassembler:

8793 **The compiler now emits a warning if an attempt is made to generate a 64-**  
 8794 **bit**  
 8795 **integer constant from within a 32-bit ACPI table (Revision < 2). The**  
 8796 **integer**  
 5024 *The compiler now emits a warning if an attempt is made to generate a 64-bit*  
 5025 *integer constant from within a 32-bit ACPI table (Revision < 2). The integer*  
 8797 *is truncated to 32 bits.*

8799 Fixed a problem with large package objects: if the static length of the  
 8800 package is greater than 255, the "variable length package" opcode is  
 8801 emitted. Previously, this caused an error. This requires an update to the  
 8802 **ACPI spec, since it currently (incorrectly) states that packages larger**  
 8803 **than**  
 5031 *ACPI spec, since it currently (incorrectly) states that packages larger than*  
 8804 *255 elements are not allowed.*

8806 **The disassembler now correctly handles variable length packages and**  
 8807 **packages**  
 5034 *The disassembler now correctly handles variable length packages and packages*  
 8808 *larger than 255 elements.*

8810 -----  
 8811 08 April 2005. Summary of changes for version 20050408:

8813 1) ACPI CA Core Subsystem:

8815 Fixed three cases in the interpreter where an "index" argument to an ASL  
 8816 function was still (internally) 32 bits instead of the required 64 bits.  
 8817 This was the Index argument to the Index, Mid, and Match operators.

8819 **The "strupr" function is now permanently local (AcpiUtStrupr), since this**  
 8820 **is**  
 5046 *The "strupr" function is now permanently local (AcpiUtStrupr), since this is*  
 8821 *not a POSIX-defined function and not present in most kernel-level C*  
 8822 *libraries. All references to the C library strupr function have been*  
 8823 **removed**  
 5048 *libraries. All references to the C library strupr function have been removed*  
 8824 *from the headers.*

8826 **Completed the deployment of static functions/prototypes. All prototypes**  
 8827 **with**  
 8828 **the static attribute have been moved from the headers to the owning C**  
 8829 **file.**  
 5051 *Completed the deployment of static functions/prototypes. All prototypes with*  
 5052 *the static attribute have been moved from the headers to the owning C file.*

8831 Implemented an extract option (-e) for the AcpiBin utility (AML binary  
 8832 **utility). This option allows the utility to extract individual ACPI**  
 8833 **tables**

5055 utility). This option allows the utility to extract individual ACPI tables  
8834 from the output of AcpiDmp. It provides the same functionality of the  
8835 acpixtract.pl perl script without the worry of setting the correct perl  
8836 options. AcpiBin runs on Windows and has not yet been generated/validated  
8837 in  
5058 options. AcpiBin runs on Windows and has not yet been generated/validated in  
8838 the Linux/Unix environment (but should be soon).  
8839  
8840 Updated and fixed the table dump option for AcpiBin (-d). This option  
8841 converts a single ACPI table to a hex/ascii file, similar to the output  
8842 of  
5062 converts a single ACPI table to a hex/ascii file, similar to the output of  
8843 AcpiDmp.

8845 Code and Data Size: Current and previous core subsystem library sizes are  
8846 shown below. These are the code and data sizes for the acpica.lib  
8847 produced  
5066 shown below. These are the code and data sizes for the acpica.lib produced  
8848 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
8849 any ACPI driver or OSPM code. The debug version of the code includes the  
8850 debug output trace mechanism and has a much larger code and data size.  
8851 Note  
8852 that these values will vary depending on the efficiency of the compiler  
8853 and  
5069 debug output trace mechanism and has a much larger code and data size. Note  
5070 that these values will vary depending on the efficiency of the compiler and  
8854 the compiler options used during generation.

8856	Previous Release:			
8857	Non-Debug Version:	78.0K Code,	11.6K Data,	89.6K Total
8858	Debug Version:	163.5K Code,	69.3K Data,	232.8K Total
8859	Current Release:			
8860	Non-Debug Version:	78.2K Code,	11.6K Data,	89.8K Total
8861	Debug Version:	163.7K Code,	69.3K Data,	233.0K Total

8864 2) iASL Compiler/Disassembler:

8866 Disassembler fix: Added a check to ensure that the table length found in  
8867 the  
8868 ACPI table header within the input file is not longer than the actual  
8869 input  
5083 Disassembler fix: Added a check to ensure that the table length found in the  
5084 ACPI table header within the input file is not longer than the actual input  
8870 file size. This indicates some kind of file or table corruption.

8872 -----  
8873 29 March 2005. Summary of changes for version 20050329:

8875 1) ACPI CA Core Subsystem:

8877 An error is now generated if an attempt is made to create a Buffer Field  
8878 of  
5092 An error is now generated if an attempt is made to create a Buffer Field of  
8879 length zero (A CreateField with a length operand of zero.)

8881 The interpreter now issues a warning whenever executable code at the  
8882 module  
5095 The interpreter now issues a warning whenever executable code at the module  
8883 level is detected during ACPI table load. This will give some idea of the  
8884 prevalence of this type of code.

8886 Implemented support for references to named objects (other than control  
8887 methods) within package objects.

8889 Enhanced package object output for the debug object. Package objects are

8890 now  
5102 Enhanced package object output for the debug object. Package objects are now  
8891 completely dumped, showing all elements.

8893 Enhanced miscellaneous object output for the debug object. Any object can  
8894 now be written to the debug object (for example, a device object can be  
8895 written, and the type of the object will be displayed.)

8897 The "static" qualifier has been added to all local functions across both  
8898 the  
5109 The "static" qualifier has been added to all local functions across both the  
8899 core subsystem and the iASL compiler.

8901 The number of "long" lines (> 80 chars) within the source has been  
8902 significantly reduced, by about 1/3.

8904 Cleaned up all header files to ensure that all CA/iASL functions are  
8905 prototyped (even static functions) and the formatting is consistent.

8907 Two new header files have been added, acopcode.h and acnames.h.

8909 Removed several obsolete functions that were no longer used.

8911 Code and Data Size: Current and previous core subsystem library sizes are  
8912 shown below. These are the code and data sizes for the acpica.lib  
8913 produced  
5123 shown below. These are the code and data sizes for the acpica.lib produced  
8914 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
8915 any ACPI driver or OSPM code. The debug version of the code includes the  
8916 debug output trace mechanism and has a much larger code and data size.  
8917 Note  
8918 that these values will vary depending on the efficiency of the compiler  
8919 and  
5126 debug output trace mechanism and has a much larger code and data size. Note  
5127 that these values will vary depending on the efficiency of the compiler and  
8920 the compiler options used during generation.

8922	Previous Release:			
8923	Non-Debug Version:	78.3K Code,	11.5K Data,	89.8K Total
8924	Debug Version:	165.4K Code,	69.7K Data,	236.1K Total
8925	Current Release:			
8926	Non-Debug Version:	78.0K Code,	11.6K Data,	89.6K Total
8927	Debug Version:	163.5K Code,	69.3K Data,	232.8K Total

8931 2) iASL Compiler/Disassembler:

8933 Fixed a problem with the resource descriptor generation/support. For the  
8934 ResourceSourceIndex and the ResourceSource fields, both must be present,  
8935 or  
5142 ResourceSourceIndex and the ResourceSource fields, both must be present, or  
8936 both must be not present - can't have one without the other.

8938 The compiler now returns non-zero from the main procedure if any errors  
8939 have  
5145 The compiler now returns non-zero from the main procedure if any errors have  
8940 occurred during the compilation.

8943 -----  
8944 09 March 2005. Summary of changes for version 20050309:

8946 1) ACPI CA Core Subsystem:

8948 The string-to-buffer implicit conversion code has been modified again

8949 after  
 8950 a change to the ACPI specification. In order to match the behavior of  
 8951 the  
 8952 other major ACPI implementation, the target buffer is no longer truncated  
 8953 if  
 8954 The string-to-buffer implicit conversion code has been modified again after  
 8955 a change to the ACPI specification. In order to match the behavior of the  
 8956 other major ACPI implementation, the target buffer is no longer truncated if  
 8957 the source string is smaller than an existing target buffer. This change  
 8958 requires an update to the ACPI spec, and should eliminate the recent  
 8959 AE\_AML\_BUFFER\_LIMIT issues.

8958 The "implicit return" support was rewritten to a new algorithm that  
 8959 solves  
 8960 the general case. Rather than attempt to determine when a method is about  
 8961 to  
 8962 exit, the result of every ASL operator is saved momentarily until the  
 8963 very  
 8964 The "implicit return" support was rewritten to a new algorithm that solves  
 8965 the general case. Rather than attempt to determine when a method is about to  
 8966 exit, the result of every ASL operator is saved momentarily until the very  
 8967 next ASL operator is executed. Therefore, no matter how the method exits,  
 8968 there will always be a saved implicit return value. This feature is only  
 8969 enabled with the AcpiGbl\_EnableInterpreterSlack flag, and should  
 8970 eliminate  
 8971 enabled with the AcpiGbl\_EnableInterpreterSlack flag, and should eliminate  
 8972 AE\_AML\_NO\_RETURN\_VALUE errors when enabled.

8970 Implemented implicit conversion support for the predicate (operand) of  
 8971 the  
 8972 If, Else, and While operators. String and Buffer arguments are  
 8973 automatically  
 8974 Implemented implicit conversion support for the predicate (operand) of the  
 8975 If, Else, and While operators. String and Buffer arguments are automatically  
 8976 converted to Integers.

8976 Changed the string-to-integer conversion behavior to match the new ACPI  
 8977 errata: "If no integer object exists, a new integer is created. The ASCII  
 8978 string is interpreted as a hexadecimal constant. Each string character is  
 8979 interpreted as a hexadecimal value ('0'-'9', 'A'-'F', 'a', 'f'), starting  
 8980 with the first character as the most significant digit, and ending with  
 8981 the  
 8982 first non-hexadecimal character or end-of-string." This means that the  
 8983 first  
 8984 with the first character as the most significant digit, and ending with the  
 8985 first non-hexadecimal character or end-of-string." This means that the first  
 8986 non-hex character terminates the conversion and this is the code that was  
 8987 changed.

8987 Fixed a problem where the ObjectType operator would fail (fault) when  
 8988 used  
 8989 Fixed a problem where the ObjectType operator would fail (fault) when used  
 8990 on an Index of a Package which pointed to a null package element. The  
 8991 operator now properly returns zero (Uninitialized) in this case.

8992 Fixed a problem where the While operator used excessive memory by not  
 8993 properly popping the result stack during execution. There was no memory  
 8994 leak  
 8995 properly popping the result stack during execution. There was no memory leak  
 8996 after execution, however. (Code provided by Valery Podrezov.)

8997 Fixed a problem where references to control methods within Package  
 8998 objects  
 8999 Fixed a problem where references to control methods within Package objects  
 9000 caused the method to be invoked, instead of producing a reference object  
 9001 pointing to the method.

9002 Restructured and simplified the pswalk.c module (AcpiPsDeleteParseTree)  
 9003 to  
 9004 Restructured and simplified the pswalk.c module (AcpiPsDeleteParseTree) to  
 9005 improve performance and reduce code size. (Code provided by Alexey  
 9006 Starikovskiy.)

9007 Code and Data Size: Current and previous core subsystem library sizes are  
 9008 shown below. These are the code and data sizes for the acpica.lib  
 9009 produced  
 9010 shown below. These are the code and data sizes for the acpica.lib produced  
 9011 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 9012 any ACPI driver or OSPM code. The debug version of the code includes the  
 9013 debug output trace mechanism and has a much larger code and data size.  
 9014 Note  
 9015 that these values will vary depending on the efficiency of the compiler  
 9016 and  
 9017 debug output trace mechanism and has a much larger code and data size. Note  
 9018 that these values will vary depending on the efficiency of the compiler and  
 9019 the compiler options used during generation.

9018	Previous Release:	
9019	Non-Debug Version:	78.3K Code, 11.5K Data, 89.8K Total
9020	Debug Version:	165.4K Code, 69.6K Data, 236.0K Total
9021	Current Release:	
9022	Non-Debug Version:	78.3K Code, 11.5K Data, 89.8K Total
9023	Debug Version:	165.4K Code, 69.7K Data, 236.1K Total

9026 2) iASL Compiler/Disassembler:

9028 Fixed a problem with the Return operator with no arguments. Since the AML  
 9029 grammar for the byte encoding requires an operand for the Return opcode,  
 9030 the  
 9031 grammar for the byte encoding requires an operand for the Return opcode, the  
 9032 compiler now emits a Return(Zero) for this case. An ACPI specification  
 9033 update has been written for this case.

9034 For tables other than the DSDT, namespace optimization is automatically  
 9035 disabled. This is because SSDTs can be loaded anywhere in the namespace,  
 9036 the  
 9037 disabled. This is because SSDTs can be loaded anywhere in the namespace, the  
 9038 compiler has no knowledge of where, and thus cannot optimize namepaths.

9039 Added "ProcessorObj" to the ObjectTypeKeyword list. This object type was  
 9040 inadvertently omitted from the ACPI specification, and will require an  
 9041 update to the spec.

9043 The source file scan for ASCII characters is now optional (-a). This  
 9044 change  
 9045 The source file scan for ASCII characters is now optional (-a). This change  
 9046 was made because some vendors place non-ascii characters within comments.  
 9047 However, the scan is simply a brute-force byte compare to ensure all  
 9048 characters in the file are in the range 0x00 to 0x7F.

9049 Fixed a problem with the CondRefOf operator where the compiler was  
 9050 inappropriately checking for the existence of the target. Since the point  
 9051 of  
 9052 inappropriately checking for the existence of the target. Since the point of  
 9053 the operator is to check for the existence of the target at run-time, the  
 9054 compiler no longer checks for the target existence.

9055 Fixed a problem where errors generated from the internal AML interpreter  
 9056 during constant folding were not handled properly, causing a fault.

9058 Fixed a problem with overly aggressive range checking for the Stall

9059 **operator. The valid range (max 255) is now only checked if the operand is**  
 9060 **of**  
 5243 *operator. The valid range (max 255) is now only checked if the operand is of*  
 9061 *type Integer. All other operand types cannot be statically checked.*

9063 **Fixed a problem where control method references within the RefOf,**  
 9064 **DeRefOf,**  
 9065 **and ObjectType operators were not treated properly. They are now treated**  
 9066 **as**  
 5246 *Fixed a problem where control method references within the RefOf, DeRefOf,*  
 5247 *and ObjectType operators were not treated properly. They are now treated as*  
 9067 *actual references, not method invocations.*

9069 **Fixed and enhanced the "list namespace" option (-ln). This option was**  
 9070 **broken**  
 5250 *Fixed and enhanced the "list namespace" option (-ln). This option was broken*  
 9071 *a number of releases ago.*

9073 **Improved error handling for the Field, IndexField, and BankField**  
 9074 **operators.**  
 5253 *Improved error handling for the Field, IndexField, and BankField operators.*  
 9075 *The compiler now cleanly reports and recovers from errors in the field*  
 9076 *component (FieldUnit) list.*

9078 **Fixed a disassembler problem where the optional ResourceDescriptor fields**  
 9079 **TRS and TTP were not always handled correctly.**

9081 **Disassembler - Comments in output now use "/" instead of "/\*"**

9083 -----  
 9084 28 February 2005. Summary of changes for version 20050228:

9086 1) ACPI CA Core Subsystem:

9088 **Fixed a problem where the result of an Index() operator (an object**  
 9089 **reference) must increment the reference count on the target object for**  
 9090 **the**  
 5268 *reference) must increment the reference count on the target object for the*  
 9091 *life of the object reference.*

9093 **Implemented AML Interpreter and Debugger support for the new ACPI 3.0**  
 9094 **Extended Address (IO, Memory, Space), QwordSpace, DwordSpace, and**  
 9095 **WordSpace**  
 5272 *Extended Address (IO, Memory, Space), QwordSpace, DwordSpace, and WordSpace*  
 9096 *resource descriptors.*

9098 **Implemented support in the \_OSI method for the ACPI 3.0 "Extended Address**  
 9099 **Space Descriptor" string, indicating interpreter support for the**  
 9100 **descriptors**  
 5276 *Space Descriptor" string, indicating interpreter support for the descriptors*  
 9101 *above.*

9103 **Implemented header support for the new ACPI 3.0 FADT flag bits.**

9105 **Implemented header support for the new ACPI 3.0 PCI Express bits for the**  
 9106 **PM1**  
 5281 *Implemented header support for the new ACPI 3.0 PCI Express bits for the PM1*  
 9107 *status/enable registers.*

9109 **Updated header support for the MADT processor local Apic struct and MADT**  
 9110 **platform interrupt source struct for new ACPI 3.0 fields.**

9112 **Implemented header support for the SRAT and SLIT ACPI tables.**

9114 **Implemented the -s switch in AcpiExec to enable the "InterpreterSlack"**  
 9115 **flag**

5289 **Implemented the -s switch in AcpiExec to enable the "InterpreterSlack" flag**  
 9116 **at runtime.**

9118 **Code and Data Size: Current and previous core subsystem library sizes are**  
 9119 **shown below. These are the code and data sizes for the acpica.lib**  
 9120 **produced**  
 5293 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9121 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9122 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9123 *debug output trace mechanism and has a much larger code and data size.*  
 9124 **Note**  
 9125 **that these values will vary depending on the efficiency of the compiler**  
 9126 **and**  
 5296 *debug output trace mechanism and has a much larger code and data size. Note*  
 5297 *that these values will vary depending on the efficiency of the compiler and*  
 9127 *the compiler options used during generation.*

9129	Previous Release:

9137 2) iASL Compiler/Disassembler:

9139 **Fixed a problem with the internal 64-bit String-to-integer conversion**  
 9140 **with**  
 5310 *Fixed a problem with the internal 64-bit String-to-integer conversion with*  
 9141 *strings less than two characters long.*

9143 **Fixed a problem with constant folding where the result of the Index()**  
 9144 **operator can not be considered a constant. This means that Index() cannot**  
 9145 **be**  
 5314 *operator can not be considered a constant. This means that Index() cannot be*  
 9146 *a type3 opcode and this will require an update to the ACPI specification.*

9148 **Disassembler: Implemented support for the TTP, MTP, and TRS resource**  
 9149 **descriptor fields. These fields were inadvertently ignored and not output**  
 9150 **in**  
 5318 *descriptor fields. These fields were inadvertently ignored and not output in*  
 9151 *the disassembly of the resource descriptor.*

9154 -----  
 9155 11 February 2005. Summary of changes for version 20050211:

9157 1) ACPI CA Core Subsystem:

9159 **Implemented ACPI 3.0 support for implicit conversion within the Match()**  
 9160 **operator. MatchObjects can now be of type integer, buffer, or string**  
 9161 **instead**  
 9162 **of just type integer. Package elements are implicitly converted to the**  
 9163 **type**  
 5328 *operator. MatchObjects can now be of type integer, buffer, or string instead*  
 5329 *of just type integer. Package elements are implicitly converted to the type*  
 9164 *of the MatchObject. This change aligns the behavior of Match() with the*  
 9165 *behavior of the other logical operators (LLess(), etc.) It also requires*  
 9166 **an**  
 5331 *behavior of the other logical operators (LLess(), etc.) It also requires an*  
 9167 *errata change to the ACPI specification as this support was intended for*  
 9168 *ACPI 3.0, but was inadvertently omitted.*

9170 **Fixed a problem with the internal implicit "to buffer" conversion.**  
 9171 **Strings**

9172 that are converted to buffers will cause buffer truncation if the string  
 9173 is  
 9174 smaller than the target buffer. Integers that are converted to buffers  
 9175 will  
 5335 Fixed a problem with the internal implicit "to buffer" conversion. Strings  
 5336 that are converted to buffers will cause buffer truncation if the string is  
 5337 smaller than the target buffer. Integers that are converted to buffers will  
 9176 not cause buffer truncation, only zero extension (both as per the ACPI  
 9177 spec.) The problem was introduced when code was added to truncate the  
 9178 buffer, but this should not be performed in all cases, only the string  
 9179 case.  
 5340 buffer, but this should not be performed in all cases, only the string case.

9181 Fixed a problem with the Buffer and Package operators where the  
 9182 interpreter  
 5342 Fixed a problem with the Buffer and Package operators where the interpreter  
 9183 would get confused if two such operators were used as operands to an ASL  
 9184 operator (such as Lless(Buffer(1){0},Buffer(1){1}). The internal result  
 9185 stack was not being popped after the execution of these operators,  
 9186 resulting  
 5345 stack was not being popped after the execution of these operators, resulting  
 9187 in an AE\_NO\_RETURN\_VALUE exception.

9189 Fixed a problem with constructs of the form Store(Index(...),...). The  
 9190 reference object returned from Index was inadvertently resolved to an  
 9191 actual  
 9192 value. This problem was introduced in version 20050114 when the behavior  
 9193 of  
 5349 reference object returned from Index was inadvertently resolved to an actual  
 5350 value. This problem was introduced in version 20050114 when the behavior of  
 9194 Store() was modified to restrict the object types that can be used as the  
 9195 source operand (to match the ACPI specification.)

9197 Reduced excessive stack use within the AcpiGetObjectInfo procedure.

9199 Added a fix to aclinux.h to allow generation of AcpiExec on Linux.

9201 Updated the AcpiSrc utility to add the FADT\_DESCRIPTOR\_REV2\_MINUS struct.

9203 Code and Data Size: Current and previous core subsystem library sizes are  
 9204 shown below. These are the code and data sizes for the acpica.lib  
 9205 produced  
 5361 shown below. These are the code and data sizes for the acpica.lib produced  
 9206 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 9207 any ACPI driver or OSPM code. The debug version of the code includes the  
 9208 debug output trace mechanism and has a much larger code and data size.  
 9209 Note  
 9210 that these values will vary depending on the efficiency of the compiler  
 9211 and  
 5364 debug output trace mechanism and has a much larger code and data size. Note  
 5365 that these values will vary depending on the efficiency of the compiler and  
 9212 the compiler options used during generation.

9214	Previous Release:	
9215	Non-Debug Version:	78.1K Code, 11.5K Data, 89.6K Total
9216	Debug Version:	164.8K Code, 69.2K Data, 234.0K Total
9217	Current Release:	
9218	Non-Debug Version:	78.2K Code, 11.5K Data, 89.7K Total
9219	Debug Version:	164.9K Code, 69.2K Data, 234.1K Total

9222 2) iASL Compiler/Disassembler:

9224 Fixed a code generation problem in the constant folding optimization code  
 9225 where incorrect code was generated if a constant was reduced to a buffer  
 9226 object (i.e., a reduced type 5 opcode.)

9228 Fixed a typechecking problem for the ToBuffer operator. Caused by an  
 9229 incorrect return type in the internal opcode information table.

9231 -----  
 9232 25 January 2005. Summary of changes for version 20050125:

9234 1) ACPI CA Core Subsystem:

9236 Fixed a recently introduced problem with the Global Lock where the  
 9237 underlying semaphore was not created. This problem was introduced in  
 9238 version 20050114, and caused an AE\_AML\_NO\_OPERAND exception during an  
 9239 Acquire() operation on \_GL.

9241 The local object cache is now optional, and is disabled by default. Both  
 9242 AcpiExec and the iASL compiler enable the cache because they run in user  
 9243 mode and this enhances their performance. #define  
 9244 ACPI\_ENABLE\_OBJECT\_CACHE  
 5397 mode and this enhances their performance. #define ACPI\_ENABLE\_OBJECT\_CACHE  
 9245 to enable the local cache.

9247 Fixed an issue in the internal function AcpiUtEvaluateObject concerning  
 9248 the  
 9249 optional "implicit return" support where an error was returned if no  
 9250 return  
 9251 object was expected, but one was implicitly returned. AE\_OK is now  
 9252 returned  
 5400 Fixed an issue in the internal function AcpiUtEvaluateObject concerning the  
 5401 optional "implicit return" support where an error was returned if no return  
 5402 object was expected, but one was implicitly returned. AE\_OK is now returned  
 9253 in this case and the implicitly returned object is deleted.  
 9254 AcpiUtEvaluateObject is only occasionally used, and only to execute  
 9255 reserved  
 5404 AcpiUtEvaluateObject is only occasionally used, and only to execute reserved  
 9256 methods such as \_STA and \_INI where the return type is known up front.

9258 Fixed a few issues with the internal convert-to-integer code. It now  
 9259 returns  
 5407 Fixed a few issues with the internal convert-to-integer code. It now returns  
 9260 an error if an attempt is made to convert a null string, a string of only  
 9261 blanks/tabs, or a zero-length buffer. This affects both implicit  
 9262 conversion  
 5409 blanks/tabs, or a zero-length buffer. This affects both implicit conversion  
 9263 and explicit conversion via the ToInteger() operator.

9265 The internal debug code in AcpiUtAcquireMutex has been commented out. It  
 9266 is  
 9267 not needed for normal operation and should increase the performance of  
 9268 the  
 9269 entire subsystem. The code remains in case it is needed for debug  
 9270 purposes  
 5412 The internal debug code in AcpiUtAcquireMutex has been commented out. It is  
 5413 not needed for normal operation and should increase the performance of the  
 5414 entire subsystem. The code remains in case it is needed for debug purposes  
 9271 again.

9273 The AcpiExec source and makefile are included in the Unix/Linux package  
 9274 for  
 5417 The AcpiExec source and makefile are included in the Unix/Linux package for  
 9275 the first time.

9277 Code and Data Size: Current and previous core subsystem library sizes are  
 9278 shown below. These are the code and data sizes for the acpica.lib  
 9279 produced  
 5421 shown below. These are the code and data sizes for the acpica.lib produced  
 9280 by the Microsoft Visual C++ 6.0 compiler, and these values do not include

9281 any ACPI driver or OSPM code. The debug version of the code includes the  
 9282 **debug output trace mechanism and has a much larger code and data size.**  
 9283 **Note**  
 9284 **that these values will vary depending on the efficiency of the compiler**  
 9285 **and**  
 9286 **debug output trace mechanism and has a much larger code and data size. Note**  
 9287 **that these values will vary depending on the efficiency of the compiler and**  
 9288 **the compiler options used during generation.**

9288	Previous Release:			
9289	Non-Debug Version:	78.4K Code,	11.5K Data,	89.9K Total
9290	Debug Version:	165.4K Code,	69.4K Data,	234.8K Total
9291	Current Release:			
9292	Non-Debug Version:	78.1K Code,	11.5K Data,	89.6K Total
9293	Debug Version:	164.8K Code,	69.2K Data,	234.0K Total

9295 2) iASL Compiler/Disassembler:

9297 **Switch/Case support: A warning is now issued if the type of the Switch**  
 9298 **value**  
 9299 *Switch/Case support: A warning is now issued if the type of the Switch value*  
 9300 *cannot be determined at compile time. For example, Switch(Arg0) will*  
 9301 **generate the warning, and the type is assumed to be an integer. As per**  
 9302 **the**  
 9303 **ACPI spec, use a construct such as Switch(ToInteger(Arg0)) to eliminate**  
 9304 **the**  
 9305 *generate the warning, and the type is assumed to be an integer. As per the*  
 9306 *ACPI spec, use a construct such as Switch(ToInteger(Arg0)) to eliminate the*  
 9307 *warning.*

9306 Switch/Case support: Implemented support for buffer and string objects as  
 9307 the switch value. This is an ACPI 3.0 feature, now that LEqual supports  
 9308 buffers and strings.

9310 **Switch/Case support: The emitted code for the LEqual() comparisons now**  
 9311 **uses**  
 9312 **the switch value as the first operand, not the second. The case value is**  
 9313 **now**  
 9314 *Switch/Case support: The emitted code for the LEqual() comparisons now uses*  
 9315 *the switch value as the first operand, not the second. The case value is now*  
 9316 *the second operand, and this allows the case value to be implicitly*  
 9317 *converted to the type of the switch value, not the other way around.*

9317 **Switch/Case support: Temporary variables are now emitted immediately**  
 9318 **within**  
 9319 **the control method, not at the global level. This means that there are**  
 9320 **now**  
 9321 **36 temps available per-method, not 36 temps per-module as was the case**  
 9322 **with**  
 9323 *Switch/Case support: Temporary variables are now emitted immediately within*  
 9324 *the control method, not at the global level. This means that there are now*  
 9325 *36 temps available per-method, not 36 temps per-module as was the case with*  
 9326 *the earlier implementation (\_T\_0 through \_T\_9 and \_T\_A through \_T\_Z.)*

9325 -----  
 9326 14 January 2005. Summary of changes for version 20050114:

9328 Added 2005 copyright to all module headers. This affects every module in  
 9329 the core subsystem, iASL compiler, and the utilities.

9331 1) ACPI CA Core Subsystem:

9333 Fixed an issue with the String-to-Buffer conversion code where the string  
 9334 **null terminator was not included in the buffer after conversion, but**  
 9335 **there**  
 9336 **is existing ASL that assumes the string null terminator is included. This**

9337 **is**  
 9338 *null terminator was not included in the buffer after conversion, but there*  
 9339 *is existing ASL that assumes the string null terminator is included. This is*  
 9340 *the root of the ACPI\_AML\_BUFFER\_LIMIT regression. This problem was*  
 9341 *introduced in the previous version when the code was updated to correctly*  
 9342 **set the converted buffer size as per the ACPI specification. The ACPI**  
 9343 **spec**  
 9344 **is ambiguous and will be updated to specify that the null terminator must**  
 9345 **be**  
 9346 *set the converted buffer size as per the ACPI specification. The ACPI spec*  
 9347 *is ambiguous and will be updated to specify that the null terminator must be*  
 9348 *included in the converted buffer. This also affects the ToBuffer() ASL*  
 9349 *operator.*

9347 Fixed a problem with the Mid() ASL/AML operator where it did not work  
 9348 **correctly on Buffer objects. Newly created sub-buffers were not being**  
 9349 **marked**  
 9350 *correctly on Buffer objects. Newly created sub-buffers were not being marked*  
 9351 *as initialized.*

9353 Fixed a problem in AcpiTbFindTable where incorrect string compares were  
 9354 **performed on the OemId and OemTableId table header fields. These fields**  
 9355 **are**  
 9356 *performed on the OemId and OemTableId table header fields. These fields are*  
 9357 *not null terminated, so strncmp is now used instead of strcmp.*

9358 Implemented a restriction on the Store() ASL/AML operator to align the  
 9359 **behavior with the ACPI specification. Previously, any object could be**  
 9360 **used**  
 9361 **as the source operand. Now, the only objects that may be used are**  
 9362 **Integers,**  
 9363 *behavior with the ACPI specification. Previously, any object could be used*  
 9364 *as the source operand. Now, the only objects that may be used are Integers,*  
 9365 *Buffers, Strings, Packages, Object References, and DDB Handles. If*  
 9366 *necessary, the original behavior can be restored by enabling the*  
 9367 *EnableInterpreterSlack flag.*

9367 **Enhanced the optional "implicit return" support to allow an implicit**  
 9368 **return**  
 9369 *Enhanced the optional "implicit return" support to allow an implicit return*  
 9370 *value from methods that are invoked externally via the AcpiEvaluateObject*  
 9371 *interface. This enables implicit returns from the \_STA and \_INI methods,*  
 9372 *for example.*

9373 **Changed the Revision() ASL/AML operator to return the current version of**  
 9374 **the**  
 9375 **AML interpreter, in the YYYYMMDD format. Previously, it incorrectly**  
 9376 **returned**  
 9377 *Changed the Revision() ASL/AML operator to return the current version of the*  
 9378 *AML interpreter, in the YYYYMMDD format. Previously, it incorrectly returned*  
 9379 *the supported ACPI version (This is the function of the \_REV method).*

9379 **Updated the \_REV predefined method to return the currently supported**  
 9380 **version**  
 9381 *Updated the \_REV predefined method to return the currently supported version*  
 9382 *of ACPI, now 3.*

9383 Implemented batch mode option for the AcpiExec utility (-b).

9385 Code and Data Size: Current and previous core subsystem library sizes are  
 9386 **shown below. These are the code and data sizes for the apica.lib**  
 9387 **produced**  
 9388 *shown below. These are the code and data sizes for the apica.lib produced*  
 9389 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9390 *any ACPI driver or OSPM code. The debug version of the code includes the*

9390 debug output trace mechanism and has a much larger code and data size.  
 9391 **Note**  
 9392 **that these values will vary depending on the efficiency of the compiler**  
 9393 **and**  
 5509 debug output trace mechanism and has a much larger code and data size. Note  
 5510 that these values will vary depending on the efficiency of the compiler and  
 9394 the compiler options used during generation.

9396	Previous Release:			
9397	Non-Debug Version:	78.3K Code,	11.5K Data,	89.8K Total
9398	Debug Version:	165.3K Code,	69.4K Data,	234.7K Total
9399	Current Release:			
9400	Non-Debug Version:	78.4K Code,	11.5K Data,	89.9K Total
9401	Debug Version:	165.4K Code,	69.4K Data,	234.8K Total

9403 -----  
 9404 10 December 2004. Summary of changes for version 20041210:

9406 ACPI 3.0 support is nearing completion in both the iASL compiler and the  
 9407 ACPI CA core subsystem.

9409 1) ACPI CA Core Subsystem:

9411 **Fixed a problem in the ToDecimalString operator where the resulting**  
 9412 **string**  
 5528 *Fixed a problem in the ToDecimalString operator where the resulting string*  
 9413 *length was incorrectly calculated. The length is now calculated exactly,*  
 9414 *eliminating incorrect AE\_STRING\_LIMIT exceptions.*

9416 **Fixed a problem in the ToHexString operator to allow a maximum 200**  
 9417 **character**  
 5532 *Fixed a problem in the ToHexString operator to allow a maximum 200 character*  
 9418 *string to be produced.*

9420 **Fixed a problem in the internal string-to-buffer and buffer-to-buffer**  
 9421 **copy**  
 5535 *Fixed a problem in the internal string-to-buffer and buffer-to-buffer copy*  
 9422 *routine where the length of the resulting buffer was not truncated to the*  
 9423 *new size (if the target buffer already existed).*

9425 Code and Data Size: Current and previous core subsystem library sizes are  
 9426 **shown below. These are the code and data sizes for the acpica.lib**  
 9427 **produced**  
 5540 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9428 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9429 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9430 *debug output trace mechanism and has a much larger code and data size.*  
 9431 **Note**  
 9432 **that these values will vary depending on the efficiency of the compiler**  
 9433 **and**  
 5543 *debug output trace mechanism and has a much larger code and data size. Note*  
 5544 *that these values will vary depending on the efficiency of the compiler and*  
 9434 *the compiler options used during generation.*

9436	Previous Release:			
9437	Non-Debug Version:	78.3K Code,	11.5K Data,	89.8K Total
9438	Debug Version:	164.7K Code,	68.5K Data,	233.2K Total
9439	Current Release:			
9440	Non-Debug Version:	78.3K Code,	11.5K Data,	89.8K Total
9441	Debug Version:	165.3K Code,	69.4K Data,	234.7K Total

9444 2) iASL Compiler/Disassembler:

9446 Implemented the new ACPI 3.0 resource template macros - DWordSpace,  
 9447 ExtendedIO, ExtendedMemory, ExtendedSpace, QWordSpace, and WordSpace.

9448 Includes support in the disassembler.

9450 **Implemented support for the new (ACPI 3.0) parameter to the Register**  
 9451 **macro,**  
 5561 *Implemented support for the new (ACPI 3.0) parameter to the Register macro,*  
 9452 *AccessSize.*

9454 Fixed a problem where the \_HE resource name for the Interrupt macro was  
 9455 referencing bit 0 instead of bit 1.

9457 Implemented check for maximum 255 interrupts in the Interrupt macro.

9459 Fixed a problem with the predefined resource descriptor names where  
 9460 incorrect AML code was generated if the offset within the resource buffer  
 9461 was 0 or 1. The optimizer shortened the AML code to a single byte opcode  
 9462 but did not update the surrounding package lengths.

9464 **Changes to the Dma macro: All channels within the channel list must be**  
 9465 **in**  
 5574 *Changes to the Dma macro: All channels within the channel list must be in*  
 9466 *the range 0-7. Maximum 8 channels can be specified. BusMaster operand is*  
 9467 *optional (default is BusMaster).*

9469 Implemented check for maximum 7 data bytes for the VendorShort macro.

9471 **The ReadWrite parameter is now optional for the Memory32 and similar**  
 9472 **macros.**  
 5580 *The ReadWrite parameter is now optional for the Memory32 and similar macros.*

9474 -----  
 9475 03 December 2004. Summary of changes for version 20041203:

9477 1) ACPI CA Core Subsystem:

9479 **The low-level field insertion/extraction code (exfldio) has been**  
 9480 **completely**  
 5587 *The low-level field insertion/extraction code (exfldio) has been completely*  
 9481 *rewritten to eliminate unnecessary complexity, bugs, and boundary*  
 9482 *conditions.*

9484 **Fixed a problem in the ToInteger, ToBuffer, ToHexString, and**  
 9485 **ToDecimalString**  
 5591 *Fixed a problem in the ToInteger, ToBuffer, ToHexString, and ToDecimalString*  
 9486 *operators where the input operand could be inadvertently deleted if no*  
 9487 *conversion was necessary (e.g., if the input to ToInteger was an Integer*  
 9488 *object.)*

9490 **Fixed a problem with the ToDecimalString and ToHexString where an**  
 9491 **incorrect**  
 5596 *Fixed a problem with the ToDecimalString and ToHexString where an incorrect*  
 9492 *exception code was returned if the resulting string would be > 200 chars.*  
 9493 *AE\_STRING\_LIMIT is now returned.*

9495 Fixed a problem with the Concatenate operator where AE\_OK was always  
 9496 returned, even if the operation failed.

9498 Fixed a problem in oswinxf (used by AcpiExec and iASL) to allow > 128  
 9499 semaphores to be allocated.

9501 Code and Data Size: Current and previous core subsystem library sizes are  
 9502 **shown below. These are the code and data sizes for the acpica.lib**  
 9503 **produced**  
 5607 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9504 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9505 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9506 *debug output trace mechanism and has a much larger code and data size.*

9507 **Note**  
 9508 **that these values will vary depending on the efficiency of the compiler**  
 9509 **and**  
 9510 *debug output trace mechanism and has a much larger code and data size. Note*  
 9511 *that these values will vary depending on the efficiency of the compiler and*  
 9512 *the compiler options used during generation.*

9512 Previous Release:  
 9513 Non-Debug Version: 78.5K Code, 11.5K Data, 90.0K Total  
 9514 Debug Version: 165.2K Code, 68.6K Data, 233.8K Total  
 9515 Current Release:  
 9516 Non-Debug Version: 78.3K Code, 11.5K Data, 89.8K Total  
 9517 Debug Version: 164.7K Code, 68.5K Data, 233.2K Total

9520 2) iASL Compiler/Disassembler:

9522 Fixed typechecking for the ObjectType and SizeOf operators. Problem was  
 9523 recently introduced in 20041119.

9525 **Fixed a problem with the ToUUID macro where the upper nybble of each**  
 9526 **buffer**  
 9527 *Fixed a problem with the ToUUID macro where the upper nybble of each buffer*  
 9528 *byte was inadvertently set to zero.*

9529 -----  
 9530 19 November 2004. Summary of changes for version 20041119:

9532 1) ACPI CA Core Subsystem:

9534 **Fixed a problem in the internal ConvertToInteger routine where new**  
 9535 **integers**  
 9536 **were not truncated to 32 bits for 32-bit ACPI tables. This routine**  
 9537 **converts**  
 9538 *Fixed a problem in the internal ConvertToInteger routine where new integers*  
 9539 *were not truncated to 32 bits for 32-bit ACPI tables. This routine converts*  
 9540 *buffers and strings to integers.*

9540 **Implemented support to store a value to an Index() on a String object.**  
 9541 **This**  
 9542 *Implemented support to store a value to an Index() on a String object. This*  
 9543 *is an ACPI 2.0 feature that had not yet been implemented.*

9544 **Implemented new behavior for storing objects to individual package**  
 9545 **elements**  
 9546 **(via the Index() operator). The previous behavior was to invoke the**  
 9547 **implicit**  
 9548 *Implemented new behavior for storing objects to individual package elements*  
 9549 *(via the Index() operator). The previous behavior was to invoke the implicit*  
 9550 *conversion rules if an object was already present at the index. The new*  
 9551 *behavior is to simply delete any existing object and directly store the*  
 9552 *new*  
 9553 *object. Although the ACPI specification seems unclear on this subject,*  
 9554 *other*  
 9555 *behavior is to simply delete any existing object and directly store the new*  
 9556 *object. Although the ACPI specification seems unclear on this subject, other*  
 9557 *ACPI implementations behave in this manner. (This is the root of the*  
 9558 *AE\_BAD\_HEX\_CONSTANT issue.)*

9556 **Modified the RSDP memory scan mechanism to support the extended checksum**  
 9557 **for**  
 9558 *Modified the RSDP memory scan mechanism to support the extended checksum for*  
 9559 *ACPI 2.0 (and above) RSDPs. Note that the search continues until a valid*  
 9560 *RSDP signature is found with a valid checksum.*

9561 Code and Data Size: Current and previous core subsystem library sizes are

9562 **shown below. These are the code and data sizes for the acpica.lib**  
 9563 **produced**  
 9564 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9565 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9566 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9567 *debug output trace mechanism and has a much larger code and data size.*  
 9568 **Note**  
 9569 **that these values will vary depending on the efficiency of the compiler**  
 9570 **and**  
 9571 *debug output trace mechanism and has a much larger code and data size. Note*  
 9572 *that these values will vary depending on the efficiency of the compiler and*  
 9573 *the compiler options used during generation.*

9572 Previous Release:  
 9573 Non-Debug Version: 78.5K Code, 11.5K Data, 90.0K Total  
 9574 Debug Version: 165.2K Code, 68.6K Data, 233.8K Total  
 9575 Current Release:  
 9576 Non-Debug Version: 78.5K Code, 11.5K Data, 90.0K Total  
 9577 Debug Version: 165.2K Code, 68.6K Data, 233.8K Total

9580 2) iASL Compiler/Disassembler:

9582 Fixed a missing semicolon in the aslcompiler.y file.

9584 -----  
 9585 05 November 2004. Summary of changes for version 20041105:

9587 1) ACPI CA Core Subsystem:

9589 **Implemented support for FADT revision 2. This was an interim table**  
 9590 **(between**  
 9591 *Implemented support for FADT revision 2. This was an interim table (between*  
 9592 *ACPI 1.0 and ACPI 2.0) that adds support for the FADT reset register.*

9593 Implemented optional support to allow uninitialized LocalX and ArgX  
 9594 **variables in a control method. The variables are initialized to an**  
 9595 **Integer**  
 9596 *variables in a control method. The variables are initialized to an Integer*  
 9597 *object with a value of zero. This support is enabled by setting the*  
 9598 *AcpiGbl\_EnableInterpreterSlack flag to TRUE.*

9599 **Implemented support for Integer objects for the SizeOf operator. Either**  
 9600 **4**  
 9601 **or 8 is returned, depending on the current integer size (32-bit or 64-**  
 9602 **bit,**  
 9603 *Implemented support for Integer objects for the SizeOf operator. Either 4*  
 9604 *or 8 is returned, depending on the current integer size (32-bit or 64-bit,*  
 9605 *depending on the parent table revision).*

9605 **Fixed a problem in the implementation of the SizeOf and ObjectType**  
 9606 **operators**  
 9607 *Fixed a problem in the implementation of the SizeOf and ObjectType operators*  
 9608 *where the operand was resolved to a value too early, causing incorrect*  
 9609 *return values for some objects.*

9610 Fixed some possible memory leaks during exceptional conditions.

9612 Code and Data Size: Current and previous core subsystem library sizes are  
 9613 **shown below. These are the code and data sizes for the acpica.lib**  
 9614 **produced**  
 9615 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9616 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9617 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9618 *debug output trace mechanism and has a much larger code and data size.*  
 9619 **Note**

9619 **that these values will vary depending on the efficiency of the compiler**  
 9620 **and**  
 5701 *debug output trace mechanism and has a much larger code and data size. Note*  
 5702 *that these values will vary depending on the efficiency of the compiler and*  
 9621 the compiler options used during generation.

9623 Previous Release:  
 9624 Non-Debug Version: 78.0K Code, 11.5K Data, 89.5K Total  
 9625 Debug Version: 164.8K Code, 68.6K Data, 233.4K Total  
 9626 Current Release:  
 9627 Non-Debug Version: 78.5K Code, 11.5K Data, 90.0K Total  
 9628 Debug Version: 165.2K Code, 68.6K Data, 233.8K Total

9631 2) iASL Compiler/Disassembler:

9633 Implemented support for all ACPI 3.0 reserved names and methods.

9635 Implemented all ACPI 3.0 grammar elements in the front-end, including  
 9636 support for semicolons.

9638 Implemented the ACPI 3.0 Function() and ToUUID() macros

9640 Fixed a problem in the disassembler where a Scope() operator would not be  
 9641 emitted properly if the target of the scope was in another table.

9643 -----  
 9644 15 October 2004. Summary of changes for version 20041015:

9646 Note: ACPI CA is currently undergoing an in-depth and complete formal  
 9647 evaluation to test/verify the following areas. Other suggestions are  
 9648 welcome. This will result in an increase in the frequency of releases and  
 9649 the number of bug fixes in the next few months.  
 9650 - Functional tests for all ASL/AML operators  
 9651 - All implicit/explicit type conversions  
 9652 - Bit fields and operation regions  
 9653 - 64-bit math support and 32-bit-only "truncated" math support  
 9654 - Exceptional conditions, both compiler and interpreter  
 9655 - Dynamic object deletion and memory leaks  
 9656 - ACPI 3.0 support when implemented  
 9657 - External interfaces to the ACPI subsystem

9660 1) ACPI CA Core Subsystem:

9662 **Fixed two alignment issues on 64-bit platforms - within debug statements**  
 9663 **in**  
 9664 **AcpiEvGpeDetect and AcpiEvCreateGpeBlock. Removed references to the**  
 9665 **Address**  
 5744 *Fixed two alignment issues on 64-bit platforms - within debug statements in*  
 5745 *AcpiEvGpeDetect and AcpiEvCreateGpeBlock. Removed references to the Address*  
 9666 field within the non-aligned ACPI generic address structure.

9668 Fixed a problem in the Increment and Decrement operators where incorrect  
 9669 operand resolution could result in the inadvertent modification of the  
 9670 original integer when the integer is passed into another method as an  
 9671 argument and the arg is then incremented/decremented.

9673 **Fixed a problem in the FromBCD operator where the upper 32-bits of a 64-**  
 9674 **bit**  
 5753 *Fixed a problem in the FromBCD operator where the upper 32-bits of a 64-bit*  
 9675 BCD number were truncated during conversion.

9677 **Fixed a problem in the ToDecimal operator where the length of the**  
 9678 **resulting**  
 9679 **string could be set incorrectly too long if the input operand was a**

9680 **Buffer**  
 5756 *Fixed a problem in the ToDecimal operator where the length of the resulting*  
 5757 *string could be set incorrectly too long if the input operand was a Buffer*  
 9681 object.

9683 **Fixed a problem in the Logical operators (LLess, etc.) where a NULL byte**  
 9684 **(0)**  
 5760 *Fixed a problem in the Logical operators (LLess, etc.) where a NULL byte (0)*  
 9685 within a buffer would prematurely terminate a compare between buffer  
 9686 objects.

9688 Added a check for string overflow (>200 characters as per the ACPI  
 9689 specification) during the Concatenate operator with two string operands.

9691 Code and Data Size: Current and previous core subsystem library sizes are  
 9692 **shown below. These are the code and data sizes for the acpica.lib**  
 9693 **produced**  
 5768 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9694 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 9695 any ACPI driver or OSPM code. The debug version of the code includes the  
 9696 **debug output trace mechanism and has a much larger code and data size.**  
 9697 **Note**  
 9698 **that these values will vary depending on the efficiency of the compiler**  
 9699 **and**  
 5771 *debug output trace mechanism and has a much larger code and data size. Note*  
 5772 *that these values will vary depending on the efficiency of the compiler and*  
 9700 the compiler options used during generation.

9702 Previous Release:  
 9703 Non-Debug Version: 77.8K Code, 11.5K Data, 89.3K Total  
 9704 Debug Version: 164.6K Code, 68.5K Data, 233.1K Total  
 9705 Current Release:  
 9706 Non-Debug Version: 78.0K Code, 11.5K Data, 89.5K Total  
 9707 Debug Version: 164.8K Code, 68.6K Data, 233.4K Total

9711 2) iASL Compiler/Disassembler:

9713 Allow the use of the ObjectType operator on uninitialized Locals and Args  
 9714 (returns 0 as per the ACPI specification).

9716 **Fixed a problem where the compiler would fault if there was a syntax**  
 9717 **error**  
 5789 *Fixed a problem where the compiler would fault if there was a syntax error*  
 9718 in the FieldName of all of the various CreateXXXField operators.

9720 **Disallow the use of lower case letters within the EISAID macro, as per**  
 9721 **the**  
 9722 **ACPI specification. All EISAID strings must be of the form "UUUNNNN"**  
 9723 **Where**  
 5792 *Disallow the use of lower case letters within the EISAID macro, as per the*  
 5793 *ACPI specification. All EISAID strings must be of the form "UUUNNNN" Where*  
 9724 U is an uppercase letter and N is a hex digit.

9727 -----  
 9728 06 October 2004. Summary of changes for version 20041006:

9730 1) ACPI CA Core Subsystem:

9732 Implemented support for the ACPI 3.0 Timer operator. This ASL function  
 9733 implements a 64-bit timer with 100 nanosecond granularity.

9735 Defined a new OSL interface, AcpiOsGetTimer. This interface is used to  
 9736 **implement the ACPI 3.0 Timer operator. This allows the host OS to**

9737 **implement**  
 9738 **the timer with the best clock available. Also, it keeps the core**  
 9739 **subsystem**  
 5806 *implement the ACPI 3.0 Timer operator. This allows the host OS to implement*  
 5807 *the timer with the best clock available. Also, it keeps the core subsystem*  
 9740 *out of the clock handling business, since the host OS (usually) performs*  
 9741 *this function.*

9743 *Fixed an alignment issue on 64-bit platforms. The HwLowLevelRead(Write)*  
 9744 *functions use a 64-bit address which is part of the packed ACPI Generic*  
 9745 **Address Structure. Since the structure is non-aligned, the alignment**  
 9746 **macros**  
 5813 *Address Structure. Since the structure is non-aligned, the alignment macros*  
 9747 *are now used to extract the address to a local variable before use.*

9749 **Fixed a problem where the ToInteger operator assumed all input strings**  
 9750 **were**  
 9751 **hexadecimal. The operator now handles both decimal strings and hex**  
 9752 **strings**  
 5816 *Fixed a problem where the ToInteger operator assumed all input strings were*  
 5817 *hexadecimal. The operator now handles both decimal strings and hex strings*  
 9753 *(prefixed with "0x").*

9755 *Fixed a problem where the string length in the string object created as a*  
 9756 *result of the internal ConvertToString procedure could be incorrect. This*  
 9757 **potentially affected all implicit conversions and also the**  
 9758 **ToDecimalString**  
 5822 *potentially affected all implicit conversions and also the ToDecimalString*  
 9759 *and ToHexString operators.*

9761 *Fixed two problems in the ToString operator. If the length parameter was*  
 9762 *zero, an incorrect string object was created and the value of the input*  
 9763 *length parameter was inadvertently changed from zero to Ones.*

9765 **Fixed a problem where the optional ResourceSource string in the**  
 9766 **ExtendedIRQ**  
 5829 *Fixed a problem where the optional ResourceSource string in the ExtendedIRQ*  
 9767 *resource macro was ignored.*

9769 **Simplified the interfaces to the internal division functions, reducing**  
 9770 **code**  
 5832 *Simplified the interfaces to the internal division functions, reducing code*  
 9771 *size and complexity.*

9773 *Code and Data Size: Current and previous core subsystem library sizes are*  
 9774 **shown below. These are the code and data sizes for the acpica.lib**  
 9775 **produced**  
 5836 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9776 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9777 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9778 **debug output trace mechanism and has a much larger code and data size.**  
 9779 **Note**  
 9780 **that these values will vary depending on the efficiency of the compiler**  
 9781 **and**  
 5839 *debug output trace mechanism and has a much larger code and data size. Note*  
 5840 *that these values will vary depending on the efficiency of the compiler and*  
 9782 *the compiler options used during generation.*

9784	Previous Release:			
9785	Non-Debug Version:	77.9K Code,	11.4K Data,	89.3K Total
9786	Debug Version:	164.5K Code,	68.3K Data,	232.8K Total
9787	Current Release:			
9788	Non-Debug Version:	77.8K Code,	11.5K Data,	89.3K Total
9789	Debug Version:	164.6K Code,	68.5K Data,	233.1K Total

9792 2) iASL Compiler/Disassembler:

9794 Implemented support for the ACPI 3.0 Timer operator.

9796 **Fixed a problem where the Default() operator was inadvertently ignored in**  
 9797 **a**  
 5855 *Fixed a problem where the Default() operator was inadvertently ignored in a*  
 9798 *Switch/Case block. This was a problem in the translation of the Switch*  
 9799 *statement to If...Else pairs.*

9801 **Added support to allow a standalone Return operator, with no parentheses**  
 9802 **(or**  
 5859 *Added support to allow a standalone Return operator, with no parentheses (or*  
 9803 *operands).*

9805 *Fixed a problem with code generation for the ElseIf operator where the*  
 9806 *translated Else...If parse tree was improperly constructed leading to the*  
 9807 *loss of some code.*

9809 -----

9810 22 September 2004. Summary of changes for version 20040922:

9812 1) ACPI CA Core Subsystem:

9814 **Fixed a problem with the implementation of the LNot() operator where**  
 9815 **"Ones"**  
 9816 **was not returned for the TRUE case. Changed the code to return Ones**  
 9817 **instead**  
 9818 **of (!Arg) which was usually 1. This change affects iASL constant folding**  
 9819 **for**  
 5871 *Fixed a problem with the implementation of the LNot() operator where "Ones"*  
 5872 *was not returned for the TRUE case. Changed the code to return Ones instead*  
 5873 *of (!Arg) which was usually 1. This change affects iASL constant folding for*  
 9820 *this operator also.*

9822 **Fixed a problem in AcpiUtInitializeBuffer where an existing buffer was**  
 9823 **not**  
 5876 *Fixed a problem in AcpiUtInitializeBuffer where an existing buffer was not*  
 9824 *initialized properly -- Now zero the entire buffer in this case where the*  
 9825 *buffer already exists.*

9827 *Changed the interface to AcpiOsSleep from (UINT32 Seconds, UINT32*  
 9828 *Milliseconds) to simply (ACPI\_INTEGER Milliseconds). This simplifies all*  
 9829 *related code considerably. This will require changes/updates to all OS*  
 9830 *interface layers (OSLs.)*

9832 **Implemented a new external interface, AcpiInstallExceptionHandler, to**  
 9833 **allow**  
 9834 **a system exception handler to be installed. This handler is invoked upon**  
 9835 **any**  
 5885 *Implemented a new external interface, AcpiInstallExceptionHandler, to allow*  
 5886 *a system exception handler to be installed. This handler is invoked upon any*  
 9836 *run-time exception that occurs during control method execution.*

9838 *Added support for the DSDT in AcpiTbFindTable. This allows the*  
 9839 *DataTableRegion() operator to access the local copy of the DSDT.*

9841 *Code and Data Size: Current and previous core subsystem library sizes are*  
 9842 **shown below. These are the code and data sizes for the acpica.lib**  
 9843 **produced**  
 5893 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9844 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9845 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9846 **debug output trace mechanism and has a much larger code and data size.**  
 9847 **Note**  
 9848 **that these values will vary depending on the efficiency of the compiler**

9849 **and**  
 5896 *debug output trace mechanism and has a much larger code and data size. Note*  
 5897 *that these values will vary depending on the efficiency of the compiler and*  
 9850 *the compiler options used during generation.*

9852	Previous Release:			
9853	Non-Debug Version:	77.8K Code,	11.4K Data,	89.2K Total
9854	Debug Version:	164.2K Code,	68.2K Data,	232.4K Total
9855	Current Release:			
9856	Non-Debug Version:	77.9K Code,	11.4K Data,	89.3K Total
9857	Debug Version:	164.5K Code,	68.3K Data,	232.8K Total

9860 2) iASL Compiler/Disassembler:

9862 Fixed a problem with constant folding and the LNot operator. LNot was  
 9863 **returning 1 in the TRUE case, not Ones as per the ACPI specification.**  
 9864 **This**  
 5911 *returning 1 in the TRUE case, not Ones as per the ACPI specification. This*  
 9865 *could result in the generation of an incorrect folded/reduced constant.*

9867 End-Of-File is now allowed within a "/\*"-style comment. A parse error no  
 9868 **longer occurs if such a comment is at the very end of the input ASL**  
 9869 **source**  
 5915 *longer occurs if such a comment is at the very end of the input ASL source*  
 9870 *file.*

9872 Implemented the "-r" option to override the Revision in the table header.  
 9873 **The initial use of this option will be to simplify the evaluation of the**  
 9874 **AML**  
 9875 **interpreter by allowing a single ASL source module to be compiled for**  
 9876 **either**  
 5919 *The initial use of this option will be to simplify the evaluation of the AML*  
 5920 *interpreter by allowing a single ASL source module to be compiled for either*  
 9877 *32-bit or 64-bit integers.*

9880 -----  
 9881 27 August 2004. Summary of changes for version 20040827:

9883 1) ACPI CA Core Subsystem:

9885 - Implemented support for implicit object conversion in the non-numeric  
 9886 **logical operators (LEqual, LGreater, LGreaterEqual, LLess, LLessEqual,**  
 9887 **and**  
 5930 *logical operators (LEqual, LGreater, LGreaterEqual, LLess, LLessEqual, and*  
 9888 *LNotEqual.) Any combination of Integers/Strings/Buffers may now be used;*  
 9889 **the second operand is implicitly converted on the fly to match the type**  
 9890 **of**  
 5932 *the second operand is implicitly converted on the fly to match the type of*  
 9891 *the first operand. For example:*

9893     LEqual (Source1, Source2)

9895 **Source1 and Source2 must each evaluate to an integer, a string, or a**  
 9896 **buffer.**  
 9897 **The data type of Source1 dictates the required type of Source2. Source2**  
 9898 **is**  
 5937 *Source1 and Source2 must each evaluate to an integer, a string, or a buffer.*  
 5938 *The data type of Source1 dictates the required type of Source2. Source2 is*  
 9899 *implicitly converted if necessary to match the type of Source1.*

9901 - **Updated and corrected the behavior of the string conversion support.**  
 9902 **The**  
 5941 *- Updated and corrected the behavior of the string conversion support. The*  
 9903 *rules concerning conversion of buffers to strings (according to the ACPI*

9904 specification) are as follows:

9906 ToDecimalString - explicit byte-wise conversion of buffer to string of  
 9907 **decimal values (0-255) separated by commas. ToHexString - explicit byte-**  
 9908 **wise**  
 5946 *decimal values (0-255) separated by commas. ToHexString - explicit byte-wise*  
 9909 *conversion of buffer to string of hex values (0-FF) separated by commas.*  
 9910 **ToString - explicit byte-wise conversion of buffer to string. Byte-by-**  
 9911 **byte**  
 9912 **copy with no transform except NULL terminated. Any other implicit buffer-**  
 9913 **to-**  
 9914 **string conversion - byte-wise conversion of buffer to string of hex**  
 9915 **values**  
 5948 *ToString - explicit byte-wise conversion of buffer to string. Byte-by-byte*  
 5949 *copy with no transform except NULL terminated. Any other implicit buffer-to-*  
 5950 *string conversion - byte-wise conversion of buffer to string of hex values*  
 9916 *(0-FF) separated by spaces.*

9918 - Fixed typo in definition of AcpiGbl\_EnableInterpreterSlack.

9920 - **Fixed a problem in AcpiNsGetPathnameLength where the returned length**  
 9921 **was**  
 5955 *- Fixed a problem in AcpiNsGetPathnameLength where the returned length was*  
 9922 *one byte too short in the case of a node in the root scope. This could*  
 9923 *cause a fault during debug output.*

9925 - **Code and Data Size: Current and previous core subsystem library sizes**  
 9926 **are**  
 9927 **shown below. These are the code and data sizes for the acpica.lib**  
 9928 **produced**  
 5959 *- Code and Data Size: Current and previous core subsystem library sizes are*  
 5960 *shown below. These are the code and data sizes for the acpica.lib produced*  
 9929 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 9930 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 9931 **debug output trace mechanism and has a much larger code and data size.**

9945 2) iASL Compiler/Disassembler:

9947 - Fixed a Linux generation error.

9950 -----  
 9951 16 August 2004. Summary of changes for version 20040816:

9953 1) ACPI CA Core Subsystem:

9955 Designed and implemented support within the AML interpreter for the so-  
 9956 **called "implicit return". This support returns the result of the last**  
 9957 **ASL**  
 5986 *called "implicit return". This support returns the result of the last ASL*  
 9958 *operation within a control method, in the absence of an explicit Return()*  
 9959 *operator. A few machines depend on this behavior, even though it is not*

9960 explicitly supported by the ASL language. It is optional support that  
 9961 can  
 9989 explicitly supported by the ASL language. It is optional support that can  
 9962 be enabled at runtime via the AcpiGbl\_EnableInterpreterSlack flag.

9964 Removed support for the PCI\_Config address space from the internal low  
 9965 level  
 5992 Removed support for the PCI\_Config address space from the internal low level  
 9966 hardware interfaces (AcpiHwLowLevelRead and AcpiHwLowLevelWrite). This  
 9967 support was not used internally, and would not work correctly anyway  
 9968 because  
 5994 support was not used internally, and would not work correctly anyway because  
 9969 the PCI bus number and segment number were not supported. There are  
 9970 separate interfaces for PCI configuration space access because of the  
 9971 unique  
 5996 separate interfaces for PCI configuration space access because of the unique  
 9972 interface.

9974 Code and Data Size: Current and previous core subsystem library sizes are  
 9975 shown below. These are the code and data sizes for the acpica.lib  
 9976 produced  
 6000 shown below. These are the code and data sizes for the acpica.lib produced  
 9977 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 9978 any ACPI driver or OSPM code. The debug version of the code includes the  
 9979 debug output trace mechanism and has a much larger code and data size.  
 9980 Note  
 9981 that these values will vary depending on the efficiency of the compiler  
 9982 and  
 6003 debug output trace mechanism and has a much larger code and data size. Note  
 6004 that these values will vary depending on the efficiency of the compiler and  
 9983 the compiler options used during generation.

9985	Previous Release:			
9986	Non-Debug Version:	78.0K Code,	11.5K Data,	89.5K Total
9987	Debug Version:	164.1K Code,	68.2K Data,	232.3K Total
9988	Current Release:			
9989	Non-Debug Version:	77.9K Code,	11.5K Data,	89.4K Total
9990	Debug Version:	164.1K Code,	68.3K Data,	232.4K Total

9993 2) iASL Compiler/Disassembler:

9995 Fixed a problem where constants in ASL expressions at the root level (not  
 9996 within a control method) could be inadvertently truncated during code  
 9997 generation. This problem was introduced in the 20040715 release.

10000 -----  
 10001 15 July 2004. Summary of changes for version 20040715:

10003 1) ACPI CA Core Subsystem:

10005 Restructured the internal HW GPE interfaces to pass/track the current  
 10006 state  
 6027 Restructured the internal HW GPE interfaces to pass/track the current state  
 10007 of interrupts (enabled/disabled) in order to avoid possible deadlock and  
 10008 increase flexibility of the interfaces.

10010 Implemented a "lexicographical compare" for String and Buffer objects  
 10011 within  
 10012 the logical operators -- LGreater, LLess, LGreaterEqual, and LLessEqual -  
 10013 -  
 10014 as per further clarification to the ACPI specification. Behavior is  
 10015 similar  
 6031 Implemented a "lexicographical compare" for String and Buffer objects within  
 6032 the logical operators -- LGreater, LLess, LGreaterEqual, and LLessEqual --

6033 as per further clarification to the ACPI specification. Behavior is similar  
 10016 to C library "strcmp".

10018 Completed a major reduction in CPU stack use for the AcpiGetFirmwareTable  
 10019 external function. In the 32-bit non-debug case, the stack use has been  
 10020 reduced from 168 bytes to 32 bytes.

10022 Deployed a new run-time configuration flag,  
 10023 AcpiGbl\_EnableInterpreterSlack,  
 6040 Deployed a new run-time configuration flag, AcpiGbl\_EnableInterpreterSlack,  
 10024 whose purpose is to allow the AML interpreter to forgive certain bad AML  
 10025 constructs. Default setting is FALSE.

10027 Implemented the first use of AcpiGbl\_EnableInterpreterSlack in the Field  
 10028 IO  
 10029 support code. If enabled, it allows field access to go beyond the end of  
 10030 a  
 10031 region definition if the field is within the region length rounded up to  
 10032 the  
 6044 Implemented the first use of AcpiGbl\_EnableInterpreterSlack in the Field IO  
 6045 support code. If enabled, it allows field access to go beyond the end of a  
 6046 region definition if the field is within the region length rounded up to the  
 10033 next access width boundary (a common coding error.)

10035 Renamed OSD\_HANDLER to ACPI\_OSD\_HANDLER, and OSD\_EXECUTION\_CALLBACK to  
 10036 ACPI\_OSD\_EXEC\_CALLBACK for consistency with other ACPI symbols. Also,  
 10037 these  
 6050 ACPI\_OSD\_EXEC\_CALLBACK for consistency with other ACPI symbols. Also, these  
 10038 symbols are lowercased by the latest version of the AcpiSrc tool.

10040 The prototypes for the PCI interfaces in acpiosxf.h have been updated to  
 10041 rename "Register" to simply "Reg" to prevent certain compilers from  
 10042 complaining.

10044 Code and Data Size: Current and previous core subsystem library sizes are  
 10045 shown below. These are the code and data sizes for the acpica.lib  
 10046 produced  
 6058 shown below. These are the code and data sizes for the acpica.lib produced  
 10047 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 10048 any ACPI driver or OSPM code. The debug version of the code includes the  
 10049 debug output trace mechanism and has a much larger code and data size.  
 10050 Note  
 10051 that these values will vary depending on the efficiency of the compiler  
 10052 and  
 6061 debug output trace mechanism and has a much larger code and data size. Note  
 6062 that these values will vary depending on the efficiency of the compiler and  
 10053 the compiler options used during generation.

10055	Previous Release:			
10056	Non-Debug Version:	77.8K Code,	11.5K Data,	89.3K Total
10057	Debug Version:	163.8K Code,	68.2K Data,	232.0K Total
10058	Current Release:			
10059	Non-Debug Version:	78.0K Code,	11.5K Data,	89.5K Total
10060	Debug Version:	164.1K Code,	68.2K Data,	232.3K Total

10063 2) iASL Compiler/Disassembler:

10065 Implemented full support for Package objects within the Case() operator.  
 10066 Note: The Break() operator is currently not supported within Case blocks  
 10067 (TermLists) as there is some question about backward compatibility with  
 10068 ACPI  
 6077 (TermLists) as there is some question about backward compatibility with ACPI  
 10069 1.0 interpreters.

10072 **Fixed a problem where complex terms were not supported properly within**  
 10073 **the**  
 6081 *Fixed a problem where complex terms were not supported properly within the*  
 10074 *Switch() operator.*

10076 Eliminated extraneous warning for compiler-emitted reserved names of the  
 10077 form "\_T\_x". (Used in Switch/Case operators.)

10079 Eliminated optimization messages for "\_T\_x" objects and small constants  
 10080 within the DefinitionBlock operator.

10083 -----  
 10084 15 June 2004. Summary of changes for version 20040615:

10086 1) ACPI CA Core Subsystem:

10088 **Implemented support for Buffer and String objects (as per ACPI 2.0) for**  
 10089 **the**  
 6096 *Implemented support for Buffer and String objects (as per ACPI 2.0) for the*  
 10090 *following ASL operators: LEqual, LGreater, LLess, LGreaterEqual, and*  
 10091 *LLessEqual.*

10093 All directory names in the entire source package are lower case, as they  
 10094 were in earlier releases.

10096 **Implemented "Disassemble" command in the AML debugger that will**  
 10097 **disassemble**  
 6103 *Implemented "Disassemble" command in the AML debugger that will disassemble*  
 10098 *a single control method.*

10100 Code and Data Size: Current and previous core subsystem library sizes are  
 10101 **shown below. These are the code and data sizes for the acpica.lib**  
 10102 **produced**  
 6107 *shown below. These are the code and data sizes for the acpica.lib produced*  
 10103 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 10104 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 10105 *debug output trace mechanism and has a much larger code and data size.*  
 10106 **Note**  
 10107 **that these values will vary depending on the efficiency of the compiler**  
 10108 **and**  
 6110 *debug output trace mechanism and has a much larger code and data size. Note*  
 6111 *that these values will vary depending on the efficiency of the compiler and*  
 10109 *the compiler options used during generation.*

10111 Previous Release:  
 10112 Non-Debug Version: 77.7K Code, 11.5K Data, 89.2K Total  
 10113 Debug Version: 163.3K Code, 67.2K Data, 230.5K Total

10115 Current Release:  
 10116 Non-Debug Version: 77.8K Code, 11.5K Data, 89.3K Total  
 10117 Debug Version: 163.8K Code, 68.2K Data, 232.0K Total

10120 2) iASL Compiler/Disassembler:

10122 **Implemented support for Buffer and String objects (as per ACPI 2.0) for**  
 10123 **the**  
 6125 *Implemented support for Buffer and String objects (as per ACPI 2.0) for the*  
 10124 *following ASL operators: LEqual, LGreater, LLess, LGreaterEqual, and*  
 10125 *LLessEqual.*

10127 All directory names in the entire source package are lower case, as they  
 10128 were in earlier releases.

10130 Fixed a fault when using the -g or -d<nofilename> options if the FADT was

10131 not found.

10133 **Fixed an issue with the Windows version of the compiler where later**  
 10134 **versions**  
 6135 *Fixed an issue with the Windows version of the compiler where later versions*  
 10135 *of Windows place the FADT in the registry under the name "FADT" and not*  
 10136 *"FACP" as earlier versions did. This applies when using the -g or -*  
 10137 *d<nofilename> options. The compiler now looks for both strings as*  
 10138 *necessary.*

10140 **Fixed a problem with compiler namepath optimization where a namepath**  
 10141 **within**  
 10142 **the Scope() operator could not be optimized if the namepath was a subpath**  
 10143 **of**  
 6141 *Fixed a problem with compiler namepath optimization where a namepath within*  
 6142 *the Scope() operator could not be optimized if the namepath was a subpath of*  
 10144 *the current scope path.*

10146 -----  
 10147 27 May 2004. Summary of changes for version 20040527:

10149 1) ACPI CA Core Subsystem:

10151 **Completed a new design and implementation for EBDA (Extended BIOS Data**  
 10152 **Area)**  
 10153 **support in the RSDP scan code. The original code improperly scanned for**  
 10154 **the**  
 10155 **EBDA by simply scanning from memory location 0 to 0x400. The correct**  
 10156 **method**  
 6150 *Completed a new design and implementation for EBDA (Extended BIOS Data Area)*  
 6151 *support in the RSDP scan code. The original code improperly scanned for the*  
 6152 *EBDA by simply scanning from memory location 0 to 0x400. The correct method*  
 10157 *is to first obtain the EBDA pointer from within the BIOS data area, then*  
 10158 *scan 1K of memory starting at the EBDA pointer. There appear to be few*  
 10159 *if*  
 6154 *scan 1K of memory starting at the EBDA pointer. There appear to be few if*  
 10160 *any machines that place the RSDP in the EBDA, however.*

10162 Integrated a fix for a possible fault during evaluation of BufferField  
 10163 arguments. Obsolete code that was causing the problem was removed.

10165 Found and fixed a problem in the Field Support Code where data could be  
 10166 corrupted on a bit field read that starts on an aligned boundary but does  
 10167 not end on an aligned boundary. Merged the read/write "datum length"  
 10168 calculation code into a common procedure.

10170 Rolled in a couple of changes to the FreeBSD-specific header.

10173 Code and Data Size: Current and previous core subsystem library sizes are  
 10174 **shown below. These are the code and data sizes for the acpica.lib**  
 10175 **produced**  
 6169 *shown below. These are the code and data sizes for the acpica.lib produced*  
 10176 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 10177 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 10178 *debug output trace mechanism and has a much larger code and data size.*  
 10179 **Note**  
 10180 **that these values will vary depending on the efficiency of the compiler**  
 10181 **and**  
 6172 *debug output trace mechanism and has a much larger code and data size. Note*  
 6173 *that these values will vary depending on the efficiency of the compiler and*  
 10182 *the compiler options used during generation.*

 10195 **a**  
 6186 *Fixed a generation warning produced by some overly-verbose compilers for a*  
 10196 *64-bit constant.*

10198 -----  
 10199 14 May 2004. Summary of changes for version 20040514:

10201 1) ACPI CA Core Subsystem:

10203 Fixed a problem where hardware GPE enable bits sometimes not set properly  
 10204 during and after GPE method execution. Result of 04/27 changes.

10206 Removed extra "clear all GPEs" when sleeping/waking.

10208 Removed AcpiHwEnableGpe and AcpiHwDisableGpe, replaced by the single  
 10209 **AcpiHwWriteGpeEnableReg. Changed a couple of calls to the functions above**  
 10210 **to**  
 6200 *AcpiHwWriteGpeEnableReg. Changed a couple of calls to the functions above to*  
 10211 *the new AcpiEv\* calls as appropriate.*

10213 **ACPI\_OS\_NAME was removed from the OS-specific headers. The default name**  
 10214 **is**  
 10215 **now "Microsoft Windows NT" for maximum compatibility. However this can**  
 10216 **be**  
 6203 *ACPI\_OS\_NAME was removed from the OS-specific headers. The default name is*  
 6204 *now "Microsoft Windows NT" for maximum compatibility. However this can be*  
 10217 *changed by modifying the acconfig.h file.*

10219 Allow a single invocation of AcpiInstallNotifyHandler for a handler that  
 10220 traps both types of notifies (System, Device). Use ACPI\_ALL\_NOTIFY flag.

10222 Run \_INI methods on ThermalZone objects. This is against the ACPI  
 10223 **specification, but there is apparently ASL code in the field that has**  
 10224 **these**  
 6211 *specification, but there is apparently ASL code in the field that has these*  
 10225 *\_INI methods, and apparently "other" AML interpreters execute them.*

10227 Performed a full 16/32/64 bit lint that resulted in some small changes.

10229 Added a sleep simulation command to the AML debugger to test sleep code.

10231 Code and Data Size: Current and previous core subsystem library sizes are  
 10232 **shown below. These are the code and data sizes for the acpica.lib**  
 10233 **produced**  
 6219 *shown below. These are the code and data sizes for the acpica.lib produced*  
 10234 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 10235 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 10236 *debug output trace mechanism and has a much larger code and data size.*  
 10237 **Note**  
 10238 **that these values will vary depending on the efficiency of the compiler**  
 10239 **and**  
 6222 *debug output trace mechanism and has a much larger code and data size. Note*  
 6223 *that these values will vary depending on the efficiency of the compiler and*  
 10240 *the compiler options used during generation.*

10242 Previous Release:  
 10243 Non-Debug Version: 77.6K Code, 11.5K Data, 89.1K Total  
 10244 Debug Version: 162.9K Code, 67.0K Data, 229.9K Total

10245 Current Release:  
 10246 Non-Debug Version: 77.6K Code, 11.5K Data, 89.1K Total  
 10247 Debug Version: 163.2K Code, 67.2K Data, 230.4K Total

10249 -----  
 10250 27 April 2004. Summary of changes for version 20040427:

10252 1) ACPI CA Core Subsystem:

10254 Completed a major overhaul of the GPE handling within ACPI CA. There are  
 10255 **now three types of GPEs: wake-only, runtime-only, and combination**  
 10256 **wake/run.**  
 6239 *now three types of GPEs: wake-only, runtime-only, and combination wake/run.*  
 10257 *The only GPEs allowed to be combination wake/run are for button-style*  
 10258 *devices such as a control-method power button, control-method sleep*  
 10259 *button,*  
 10260 *or a notebook lid switch. GPEs that have an \_Lxx or \_Exx method and are*  
 10261 *not*  
 6241 *devices such as a control-method power button, control-method sleep button,*  
 6242 *or a notebook lid switch. GPEs that have an \_Lxx or \_Exx method and are not*  
 10262 *referenced by any \_PRW methods are marked for "runtime" and hardware*  
 10263 *enabled. Any GPE that is referenced by a \_PRW method is marked for*  
 10264 *"wake"*  
 6244 *enabled. Any GPE that is referenced by a \_PRW method is marked for "wake"*  
 10265 *(and disabled at runtime). However, at sleep time, only those GPEs that*  
 10266 *have been specifically enabled for wake via the AcpiEnableGpe interface*  
 10267 *will*  
 6246 *have been specifically enabled for wake via the AcpiEnableGpe interface will*  
 10268 *actually be hardware enabled.*

10270 **A new external interface has been added, AcpiSetGpeType(), that is meant**  
 10271 **to**  
 10272 **be used by device drivers to force a GPE to a particular type. It will**  
 10273 **be**  
 6249 *A new external interface has been added, AcpiSetGpeType(), that is meant to*  
 6250 *be used by device drivers to force a GPE to a particular type. It will be*  
 10274 *especially useful for the drivers for the button devices mentioned above.*

10276 Completed restructuring of the ACPI CA initialization sequence so that  
 10277 **default operation region handlers are installed before GPEs are**  
 10278 **initialized**  
 10279 **and the \_PRW methods are executed. This will prevent errors when the**  
 10280 **\_PRW**  
 6254 *default operation region handlers are installed before GPEs are initialized*  
 6255 *and the \_PRW methods are executed. This will prevent errors when the \_PRW*  
 10281 *methods attempt to access system memory or I/O space.*

10283 **GPE enable/disable no longer reads the GPE enable register. We now keep**  
 10284 **the**  
 6258 *GPE enable/disable no longer reads the GPE enable register. We now keep the*  
 10285 *enable info for runtime and wake separate and in the GPE\_EVENT\_INFO. We*  
 10286 *thus no longer depend on the hardware to maintain these bits.*

10288 Always clear the wake status and fixed/GPE status bits before sleep, even  
 10289 for state S5.

10291 Improved the AML debugger output for displaying the GPE blocks and their  
 10292 current status.

10294 **Added new strings for the \_OSI method, of the form "Windows 2001 SPx"**  
 10295 **where**  
 6268 *Added new strings for the \_OSI method, of the form "Windows 2001 SPx" where*  
 10296 *x = 0,1,2,3,4.*

10298 **Fixed a problem where the physical address was incorrectly calculated**  
 10299 **when**

10300 the Load() operator was used to directly load from an Operation Region  
 10301 (vs.  
 10302 loading from a Field object.) Also added check for minimum table length  
 10303 for  
 6271 Fixed a problem where the physical address was incorrectly calculated when  
 6272 the Load() operator was used to directly load from an Operation Region (vs.  
 6273 loading from a Field object.) Also added check for minimum table length for  
 10304 this case.

10306 Fix for multiple mutex acquisition. Restore original thread SyncLevel on  
 10307 mutex release.

10309 Added ACPI\_VALID\_SXDS flag to the AcpiGetObjectInfo interface for  
 10310 consistency with the other fields returned.

10312 Shrunk the ACPI\_GPE\_EVENT\_INFO structure by 40%. There is one such  
 10313 structure for each GPE in the system, so the size of this structure is  
 10314 important.

10316 CPU stack requirement reduction: Cleaned up the method execution and  
 10317 object  
 6286 CPU stack requirement reduction: Cleaned up the method execution and object  
 10318 evaluation paths so that now a parameter structure is passed, instead of  
 10319 copying the various method parameters over and over again.

10321 In evregion.c: Correctly exit and reenter the interpreter region if and  
 10322 only if dispatching an operation region request to a user-installed  
 10323 handler.  
 6291 only if dispatching an operation region request to a user-installed handler.  
 10324 Do not exit/reenter when dispatching to a default handler (e.g., default  
 10325 system memory or I/O handlers)

10328 Notes for updating drivers for the new GPE support. The following  
 10329 changes  
 10330 must be made to ACPI-related device drivers that are attached to one or  
 10331 more  
 10332 GPEs: (This information will be added to the ACPI CA Programmer  
 10333 Reference.)  
 6296 Notes for updating drivers for the new GPE support. The following changes  
 6297 must be made to ACPI-related device drivers that are attached to one or more  
 6298 GPEs: (This information will be added to the ACPI CA Programmer Reference.)

10335 1) AcpiInstallGpeHandler no longer automatically enables the GPE, you  
 10336 must  
 6300 1) AcpiInstallGpeHandler no longer automatically enables the GPE, you must  
 10337 explicitly call AcpiEnableGpe.  
 10338 2) There is a new interface called AcpiSetGpeType. This should be called  
 10339 before enabling the GPE. Also, this interface will automatically disable  
 10340 the GPE if it is currently enabled.  
 10341 3) AcpiEnableGpe no longer supports a GPE type flag.

10343 Specific drivers that must be changed:

10344 1) EC driver:  
 10345 AcpiInstallGpeHandler (NULL, GpeNum, ACPI\_GPE\_EDGE\_TRIGGERED,  
 10346 AeGpeHandler, NULL);  
 10347 AcpiSetGpeType (NULL, GpeNum, ACPI\_GPE\_TYPE\_RUNTIME);  
 10348 AcpiEnableGpe (NULL, GpeNum, ACPI\_NOT\_ISR);

10350 2) Button Drivers (Power, Lid, Sleep):

10351 Run \_PRW method under parent device  
 10352 If \_PRW exists: /\* This is a control-method button \*/  
 10353 Extract GPE number and possibly GpeDevice  
 10354 AcpiSetGpeType (GpeDevice, GpeNum, ACPI\_GPE\_TYPE\_WAKE\_RUN);  
 10355 AcpiEnableGpe (GpeDevice, GpeNum, ACPI\_NOT\_ISR);

10357 For all other devices that have \_PRWs, we automatically set the GPE type  
 10358 to  
 10359 ACPI\_GPE\_TYPE\_WAKE, but the GPE is NOT automatically (wake) enabled.  
 10360 This  
 10361 must be done on a selective basis, usually requiring some kind of user  
 10362 app  
 6321 For all other devices that have \_PRWs, we automatically set the GPE type to  
 6322 ACPI\_GPE\_TYPE\_WAKE, but the GPE is NOT automatically (wake) enabled. This  
 6323 must be done on a selective basis, usually requiring some kind of user app  
 10363 to allow the user to pick the wake devices.

10366 Code and Data Size: Current and previous core subsystem library sizes are  
 10367 shown below. These are the code and data sizes for the acpica.lib  
 10368 produced  
 6328 shown below. These are the code and data sizes for the acpica.lib produced  
 10369 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 10370 any ACPI driver or OSPM code. The debug version of the code includes the  
 10371 debug output trace mechanism and has a much larger code and data size.  
 10372 Note  
 10373 that these values will vary depending on the efficiency of the compiler  
 10374 and  
 6331 debug output trace mechanism and has a much larger code and data size. Note  
 6332 that these values will vary depending on the efficiency of the compiler and  
 10375 the compiler options used during generation.

10377 Previous Release:  
 10378 Non-Debug Version: 77.0K Code, 11.4K Data, 88.4K Total  
 10379 Debug Version: 161.0K Code, 66.3K Data, 227.3K Total  
 10380 Current Release:

10382 Non-Debug Version: 77.6K Code, 11.5K Data, 89.1K Total  
 10383 Debug Version: 162.9K Code, 67.0K Data, 229.9K Total

10387 -----  
 10388 02 April 2004. Summary of changes for version 20040402:

10390 1) ACPI CA Core Subsystem:

10392 Fixed an interpreter problem where an indirect store through an ArgX  
 10393 parameter was incorrectly applying the "implicit conversion rules" during  
 10394 the store. From the ACPI specification: "If the target is a method local  
 10395 or  
 6352 the store. From the ACPI specification: "If the target is a method local or  
 10396 argument (LocalX or ArgX), no conversion is performed and the result is  
 10397 stored directly to the target". The new behavior is to disable implicit  
 10398 conversion during ALL stores to an ArgX.

10400 Changed the behavior of the \_PRW method scan to ignore any and all errors  
 10401 returned by a given \_PRW. This prevents the scan from aborting from the  
 10402 failure of any single \_PRW.

10404 Moved the runtime configuration parameters from the global init procedure  
 10405 to  
 6361 Moved the runtime configuration parameters from the global init procedure to  
 10406 static variables in acglobal.h. This will allow the host to override the  
 10407 default values easily.

10409 Code and Data Size: Current and previous core subsystem library sizes are  
 10410 shown below. These are the code and data sizes for the acpica.lib  
 10411 produced  
 6366 shown below. These are the code and data sizes for the acpica.lib produced  
 10412 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 10413 any ACPI driver or OSPM code. The debug version of the code includes the

10414 debug output trace mechanism and has a much larger code and data size.  
 10415 **Note**  
 10416 **that these values will vary depending on the efficiency of the compiler**  
 10417 **and**  
 6369 debug output trace mechanism and has a much larger code and data size. *Note*  
 6370 *that these values will vary depending on the efficiency of the compiler and*  
 10418 the compiler options used during generation.

10420 Previous Release:  
 10421 Non-Debug Version: 76.9K Code, 11.4K Data, 88.3K Total  
 10422 Debug Version: 160.8K Code, 66.1K Data, 226.9K Total  
 10423 Current Release:  
 10424 Non-Debug Version: 77.0K Code, 11.4K Data, 88.4K Total  
 10425 Debug Version: 161.0K Code, 66.3K Data, 227.3K Total

10428 2) iASL Compiler/Disassembler:

10430 **iASL now fully disassembles SSDTs. However, External() statements are**  
 10431 **not**  
 6383 *iASL now fully disassembles SSDTs. However, External() statements are not*  
 10432 generated automatically for unresolved symbols at this time. This is a  
 10433 planned feature for future implementation.

10435 **Fixed a scoping problem in the disassembler that occurs when the type of**  
 10436 **the**  
 6387 *Fixed a scoping problem in the disassembler that occurs when the type of the*  
 10437 target of a Scope() operator is overridden. This problem caused an  
 10438 incorrectly nested internal namespace to be constructed.

10440 **Any warnings or errors that are emitted during disassembly are now**  
 10441 **commented**  
 10442 **out automatically so that the resulting file can be recompiled without**  
 10443 **any**  
 6391 *Any warnings or errors that are emitted during disassembly are now commented*  
 6392 *out automatically so that the resulting file can be recompiled without any*  
 10444 hand editing.

10446 -----  
 10447 26 March 2004. Summary of changes for version 20040326:

10449 1) ACPI CA Core Subsystem:

10451 Implemented support for "wake" GPEs via interaction between GPEs and the  
 10452 \_PRW methods. Every GPE that is pointed to by one or more \_PRWs is  
 10453 identified as a WAKE GPE and by default will no longer be enabled at  
 10454 runtime. **Previously, we were blindly enabling all GPEs with a**  
 10455 **corresponding**  
 10456 **\_Lxx or \_Exx method - but most of these turn out to be WAKE GPEs anyway.**  
 10457 **We**  
 6403 *runtime. Previously, we were blindly enabling all GPEs with a corresponding*  
 6404 *\_Lxx or \_Exx method - but most of these turn out to be WAKE GPEs anyway. We*  
 10458 believe this has been the cause of thousands of "spurious" GPEs on some  
 10459 systems.

10461 This new GPE behavior is can be reverted to the original behavior (enable  
 10462 ALL GPEs at runtime) via a runtime flag.

10464 Fixed a problem where aliased control methods could not access objects  
 10465 properly. The proper scope within the namespace was not initialized  
 10466 (transferred to the target of the aliased method) before executing the  
 10467 target method.

10469 **Fixed a potential race condition on internal object deletion on the**  
 10470 **return**  
 6416 *Fixed a potential race condition on internal object deletion on the return*

10471 object in AcpiEvaluateObject.

10473 Integrated a fix for resource descriptors where both \_MEM and \_MTP were  
 10474 being extracted instead of just \_MEM. (i.e. bitmask was incorrectly too  
 10475 wide, 0x0F instead of 0x03.)

10477 **Added a special case for ACPI\_ROOT\_OBJECT in AcpiUtGetNodeName,**  
 10478 **preventing**  
 10479 **a**  
 6423 *Added a special case for ACPI\_ROOT\_OBJECT in AcpiUtGetNodeName, preventing a*  
 10480 fault in some cases.

10482 Updated Notify() values for debug statements in evmisc.c

10484 Return proper status from AcpiUtMutexInitialize, not just simply AE\_OK.

10486 Code and Data Size: Current and previous core subsystem library sizes are  
 10487 **shown below. These are the code and data sizes for the acpica.lib**  
 10488 **produced**  
 6431 *shown below. These are the code and data sizes for the acpica.lib produced*  
 10489 by the Microsoft Visual C++ 6.0 compiler, and these values do not include  
 10490 any ACPI driver or OSPM code. The debug version of the code includes the  
 10491 **debug output trace mechanism and has a much larger code and data size.**  
 10492 **Note**  
 10493 **that these values will vary depending on the efficiency of the compiler**  
 10494 **and**  
 6434 *debug output trace mechanism and has a much larger code and data size. Note*  
 6435 *that these values will vary depending on the efficiency of the compiler and*  
 10495 the compiler options used during generation.

10497 Previous Release:

10499 Non-Debug Version: 76.5K Code, 11.3K Data, 87.8K Total  
 10500 Debug Version: 160.3K Code, 66.0K Data, 226.3K Total  
 10501 Current Release:  
 10502 Non-Debug Version: 76.9K Code, 11.4K Data, 88.3K Total  
 10503 Debug Version: 160.8K Code, 66.1K Data, 226.9K Total

10505 -----  
 10506 11 March 2004. Summary of changes for version 20040311:

10508 1) ACPI CA Core Subsystem:

10510 Fixed a problem where errors occurring during the parse phase of control  
 10511 method execution did not abort cleanly. For example, objects created and  
 10512 installed in the namespace were not deleted. This caused all subsequent  
 10513 invocations of the method to return the AE\_ALREADY\_EXISTS exception.

10515 **Implemented a mechanism to force a control method to "Serialized"**  
 10516 **execution**  
 6456 *Implemented a mechanism to force a control method to "Serialized" execution*  
 10517 if the method attempts to create namespace objects. (The root of the  
 10518 AE\_ALREADY\_EXISTS problem.)

10520 Implemented support for the predefined \_OSI "internal" control method.  
 10521 **Initial supported strings are "Linux", "Windows 2000", "Windows 2001",**  
 10522 **and**  
 10523 **"Windows 2001.1", and can be easily upgraded for new strings as**  
 10524 **necessary.**  
 6461 *Initial supported strings are "Linux", "Windows 2000", "Windows 2001", and*  
 6462 *"Windows 2001.1", and can be easily upgraded for new strings as necessary.*  
 10525 This feature will allow "other" operating systems to execute the fully  
 10526 tested, "Windows" code path through the ASL code

10528 Global Lock Support: Now allows multiple acquires and releases with any  
 10529 **internal thread. Removed concept of "owning thread" for this special**

10530 **mutex.**  
 6467 *internal thread. Removed concept of "owning thread" for this special mutex.*

10532 **Fixed two functions that were inappropriately declaring large objects on the**  
 10533 **the**  
 10534 **CPU stack: PsParseLoop, NsEvaluateRelative. Reduces the stack usage**  
 10535 **during**  
 6469 *Fixed two functions that were inappropriately declaring large objects on the*  
 6470 *CPU stack: PsParseLoop, NsEvaluateRelative. Reduces the stack usage during*  
 10536 *method execution considerably.*

10538 Fixed a problem in the ACPI 2.0 FACS descriptor (actbl2.h) where the  
 10539 S4Bios\_f field was incorrectly defined as UINT32 instead of UINT32\_BIT.

10541 Fixed a problem where AcpiEvGpeDetect would fault if there were no GPEs  
 10542 defined on the machine.

10544 **Implemented two runtime options: One to force all control method**  
 10545 **execution**  
 10546 **to "Serialized" to mimic Windows behavior, another to disable \_OSI**  
 10547 **support**  
 6479 *Implemented two runtime options: One to force all control method execution*  
 6480 *to "Serialized" to mimic Windows behavior, another to disable \_OSI support*  
 10548 *if it causes problems on a given machine.*

10550 Code and Data Size: Current and previous core subsystem library sizes are  
 10551 **shown below. These are the code and data sizes for the acpica.lib**  
 10552 **produced**  
 6484 *shown below. These are the code and data sizes for the acpica.lib produced*  
 10553 *by the Microsoft Visual C++ 6.0 compiler, and these values do not include*  
 10554 *any ACPI driver or OSPM code. The debug version of the code includes the*  
 10555 *debug output trace mechanism and has a much larger code and data size.*  
 10556 **Note**  
 10557 **that these values will vary depending on the efficiency of the compiler**  
 10558 **and**  
 6487 *debug output trace mechanism and has a much larger code and data size. Note*  
 6488 *that these values will vary depending on the efficiency of the compiler and*  
 10559 *the compiler options used during generation.*

10561	Previous Release:			
10562	Non-Debug Version:	74.8K Code,	10.1K Data,	84.9K Total
10563	Debug Version:	158.7K Code,	65.1K Data,	223.8K Total
10564	Current Release:			
10565	Non-Debug Version:	76.5K Code,	11.3K Data,	87.8K Total
10566	Debug Version:	160.3K Code,	66.0K Data,	226.3K Total

10568 2) iASL Compiler/Disassembler:

10570 Fixed an array size problem for FreeBSD that would cause the compiler to  
 10571 fault.

10573 -----  
 10574 20 February 2004. Summary of changes for version 20040220:

10577 1) ACPI CA Core Subsystem:

10579 Implemented execution of \_SxD methods for Device objects in the  
 10580 GetObjectInfo interface.

10582 Fixed calls to \_SST method to pass the correct arguments.

10584 Added a call to \_SST on wake to restore to "working" state.

10586 Check for End-Of-Buffer failure case in the WalkResources interface.

10588 Integrated fix for 64-bit alignment issue in acglobal.h by moving two  
 10589 structures to the beginning of the file.

10591 After wake, clear GPE status register(s) before enabling GPEs.

10593 **After wake, clear/enable power button. (Perhaps we should clear/enable**  
 10594 **all**  
 6523 *After wake, clear/enable power button. (Perhaps we should clear/enable all*  
 10595 *fixed events upon wake.)*

10597 Fixed a couple of possible memory leaks in the Namespace manager.

10599 Integrated latest acnetbsd.h file.

10601 -----  
 10602 11 February 2004. Summary of changes for version 20040211:

10605 1) ACPI CA Core Subsystem:

10607 Completed investigation and implementation of the call-by-reference  
 10608 mechanism for control method arguments.

10610 Fixed a problem where a store of an object into an indexed package could  
 10611 fail if the store occurs within a different method than the method that  
 10612 created the package.

10614 **Fixed a problem where the ToDecimal operator could return incorrect**  
 10615 **results.**  
 6543 *Fixed a problem where the ToDecimal operator could return incorrect results.*

10617 **Fixed a problem where the CopyObject operator could fail on some of the**  
 10618 **more**  
 6545 *Fixed a problem where the CopyObject operator could fail on some of the more*  
 10619 *obscure objects (e.g., Reference objects.)*

10621 Improved the output of the Debug object to display buffer, package, and  
 10622 index objects.

10624 **Fixed a problem where constructs of the form "RefOf (ArgX)" did not**  
 10625 **return**  
 6551 *Fixed a problem where constructs of the form "RefOf (ArgX)" did not return*  
 10626 *the expected result.*

10628 Added permanent ACPI\_REPORT\_ERROR macros for all instances of the  
 10629 ACPI\_AML\_INTERNAL exception.

10631 Integrated latest version of acfreebsd.h

10633 -----  
 10634 16 January 2004. Summary of changes for version 20040116:

10636 The purpose of this release is primarily to update the copyright years in  
 10637 each module, thus causing a huge number of diffs. There are a few small  
 10638 functional changes, however.

10640 1) ACPI CA Core Subsystem:

10642 **Improved error messages when there is a problem finding one or more of**  
 10643 **the**  
 6568 *Improved error messages when there is a problem finding one or more of the*  
 10644 *required base ACPI tables*

10646 Reintroduced the definition of APIC\_HEADER in actbl.h

10648 Changed definition of MADT\_ADDRESS\_OVERRIDE to 64 bits (actbl.h)

10650 Removed extraneous reference to NewObj in dsmthdat.c

10652 2) iASL compiler

10654 **Fixed a problem introduced in December that disabled the correct**  
 10655 **disassembly**  
 10656 *Fixed a problem introduced in December that disabled the correct disassembly*  
 10656 of Resource Templates

10659 -----  
 10660 03 December 2003. Summary of changes for version 20031203:

10662 1) ACPI CA Core Subsystem:

10664 Changed the initialization of Operation Regions during subsystem  
 10665 init to perform two entire walks of the ACPI namespace; The first  
 10666 to initialize the regions themselves, the second to execute the  
 10667 \_REG methods. This fixed some interdependencies across \_REG  
 10668 methods found on some machines.

10670 Fixed a problem where a Store(Local0, Local1) could simply update  
 10671 the object reference count, and not create a new copy of the  
 10672 object if the Local1 is uninitialized.

10674 Implemented support for the \_SST reserved method during sleep  
 10675 transitions.

10677 Implemented support to clear the SLP\_TYP and SLP\_EN bits when  
 10678 waking up, this is apparently required by some machines.

10680 When sleeping, clear the wake status only if SleepState is not S5.

10682 Fixed a problem in AcpiRsExtendedIrqResource() where an incorrect  
 10683 pointer arithmetic advanced a string pointer too far.

10685 Fixed a problem in AcpiTbGetTablePtr() where a garbage pointer  
 10686 could be returned if the requested table has not been loaded.

10688 Within the support for IRQ resources, restructured the handling of  
 10689 the active and edge/level bits.

10691 Fixed a few problems in AcpiPsxExecute() where memory could be  
 10692 leaked under certain error conditions.

10694 Improved error messages for the cases where the ACPI mode could  
 10695 not be entered.

10697 Code and Data Size: Current and previous core subsystem library  
 10698 sizes are shown below. These are the code and data sizes for the  
 10699 apica.lib produced by the Microsoft Visual C++ 6.0 compiler, and  
 10700 these values do not include any ACPI driver or OSPM code. The  
 10701 debug version of the code includes the debug output trace  
 10702 mechanism and has a much larger code and data size. Note that  
 10703 these values will vary depending on the efficiency of the compiler  
 10704 and the compiler options used during generation.

10706 Previous Release (20031029):  
 10707 Non-Debug Version: 74.4K Code, 10.1K Data, 84.5K Total  
 10708 Debug Version: 158.3K Code, 65.0K Data, 223.3K Total  
 10709 Current Release:  
 10710 Non-Debug Version: 74.8K Code, 10.1K Data, 84.9K Total  
 10711 Debug Version: 158.7K Code, 65.1K Data, 223.8K Total

10713 2) iASL Compiler/Disassembler:

10715 Implemented a fix for the iASL disassembler where a bad index was  
 10716 generated. This was most noticeable on 64-bit platforms

10719 -----  
 10720 29 October 2003. Summary of changes for version 20031029:

10722 1) ACPI CA Core Subsystem:

10725 Fixed a problem where a level-triggered GPE with an associated  
 10726 \_Lxx control method was incorrectly cleared twice.

10728 Fixed a problem with the Field support code where an access can  
 10729 occur beyond the end-of-region if the field is non-aligned but  
 10730 extends to the very end of the parent region (resulted in an  
 10731 AE\_AML\_REGION\_LIMIT exception.)

10733 Fixed a problem with ACPI Fixed Events where an RT Clock handler  
 10734 would not get invoked on an RTC event. The RTC event bitmasks for  
 10735 the PM1 registers were not being initialized properly.

10737 Implemented support for executing \_STA and \_INI methods for  
 10738 Processor objects. Although this is currently not part of the  
 10739 ACPI specification, there is existing ASL code that depends on the  
 10740 init-time execution of these methods.

10742 Implemented and deployed a GetDescriptorName function to decode  
 10743 the various types of internal descriptors. Guards against null  
 10744 descriptors during debug output also.

10746 Implemented and deployed a GetNodeName function to extract the 4-  
 10747 character namespace node name. This function simplifies the debug  
 10748 and error output, as well as guarding against null pointers during  
 10749 output.

10751 Implemented and deployed the ACPI\_FORMAT\_UINT64 helper macro to  
 10752 simplify the debug and error output of 64-bit integers. This  
 10753 macro replaces the HIDWORD and LODWORD macros for dumping these  
 10754 integers.

10756 Updated the implementation of the Stall() operator to only call  
 10757 AcpiOsStall(), and also return an error if the operand is larger  
 10758 than 255. This preserves the required behavior of not  
 10759 relinquishing the processor, as would happen if AcpiOsSleep() was  
 10760 called for "long stalls".

10762 Constructs of the form "Store(LocalX,LocalX)" where LocalX is not  
 10763 initialized are now treated as NOOPs.

10765 Cleaned up a handful of warnings during 64-bit generation.

10767 Fixed a reported error where and incorrect GPE number was passed  
 10768 to the GPE dispatch handler. This value is only used for error  
 10769 output, however. Used this opportunity to clean up and streamline  
 10770 the GPE dispatch code.

10772 Code and Data Size: Current and previous core subsystem library  
 10773 sizes are shown below. These are the code and data sizes for the  
 10774 apica.lib produced by the Microsoft Visual C++ 6.0 compiler, and  
 10775 these values do not include any ACPI driver or OSPM code. The

10777 debug version of the code includes the debug output trace  
 10778 mechanism and has a much larger code and data size. Note that  
 10779 these values will vary depending on the efficiency of the compiler

10780 and the compiler options used during generation.

```
10782 Previous Release (20031002):
10783   Non-Debug Version:  74.1K Code,   9.7K Data,   83.8K Total
10784   Debug Version:     157.9K Code,  64.8K Data,  222.7K Total
10785 Current Release:
10786   Non-Debug Version:  74.4K Code,  10.1K Data,   84.5K Total
10787   Debug Version:     158.3K Code,  65.0K Data,  223.3K Total
```

10790 2) iASL Compiler/Disassembler:

10792 Updated the iASL compiler to return an error if the operand to the  
10793 Stall() operator is larger than 255.

```
10796 -----
10797 02 October 2003.  Summary of changes for version 20031002:
```

10800 1) ACPI CA Core Subsystem:

10802 Fixed a problem with Index Fields where the index was not  
10803 incremented for fields that require multiple writes to the  
10804 index/data registers (Fields that are wider than the data  
10805 register.)

10807 Fixed a problem with all Field objects where a write could go  
10808 beyond the end-of-field if the field was larger than the access  
10809 granularity and therefore required multiple writes to complete the  
10810 request. An extra write beyond the end of the field could happen  
10811 inadvertently.

10813 Fixed a problem with Index Fields where a BUFFER\_OVERFLOW error  
10814 would incorrectly be returned if the width of the Data Register  
10815 was larger than the specified field access width.

10817 Completed fixes for LoadTable() and Unload() and verified their  
10818 operation. Implemented full support for the "DdbHandle" object  
10819 throughout the ACPI CA subsystem.

10821 Implemented full support for the MADT and ECDT tables in the ACPI  
10822 CA header files. Even though these tables are not directly  
10823 consumed by ACPI CA, the header definitions are useful for ACPI  
10824 device drivers.

10826 Integrated resource descriptor fixes posted to the Linux ACPI  
10827 list. This included checks for minimum descriptor length, and  
10828 support for trailing NULL strings within descriptors that have  
10829 optional string elements.

10831 Code and Data Size: Current and previous core subsystem library  
10832 sizes are shown below. These are the code and data sizes for the  
10833 apica.lib produced by the Microsoft Visual C++ 6.0 compiler, and  
10834 these values do not include any ACPI driver or OSPM code. The  
10835 debug version of the code includes the debug output trace  
10836 mechanism and has a much larger code and data size. Note that  
10837 these values will vary depending on the efficiency of the compiler  
10838 and the compiler options used during generation.

```
10840 Previous Release (20030918):
10841   Non-Debug Version:  73.9K Code,   9.7K Data,   83.6K Total
10842   Debug Version:     157.3K Code,  64.5K Data,  221.8K Total
10843 Current Release:
10844   Non-Debug Version:  74.1K Code,   9.7K Data,   83.8K Total
10845   Debug Version:     157.9K Code,  64.8K Data,  222.7K Total
```

10848 2) iASL Compiler:

10850 Implemented detection of non-ASCII characters within the input  
10851 source ASL file. This catches attempts to compile binary (AML)  
10852 files early in the compile, with an informative error message.

10854 Fixed a problem where the disassembler would fault if the output  
10855 filename could not be generated or if the output file could not be  
10856 opened.

```
10858 -----
10859 18 September 2003.  Summary of changes for version 20030918:
```

10862 1) ACPI CA Core Subsystem:

10864 Found and fixed a longstanding problem with the late execution of  
10865 the various deferred AML opcodes (such as Operation Regions,  
10866 Buffer Fields, Buffers, and Packages). If the name string  
10867 specified for the name of the new object placed the object in a  
10868 scope other than the current scope, the initialization/execution  
10869 of the opcode failed. The solution to this problem was to  
10870 implement a mechanism where the late execution of such opcodes  
10871 does not attempt to lookup/create the name a second time in an  
10872 incorrect scope. This fixes the "region size computed  
10873 incorrectly" problem.

10875 Fixed a call to AcpiHwRegisterWrite in hwregs.c that was causing a  
10876 Global Lock AE\_BAD\_PARAMETER error.

10878 Fixed several 64-bit issues with prototypes, casting and data  
10879 types.

10881 Removed duplicate prototype from acdisasm.h

10883 Fixed an issue involving EC Operation Region Detach (Shaohua Li)

10885 Code and Data Size: Current and previous core subsystem library  
10886 sizes are shown below. These are the code and data sizes for the  
10887 apica.lib produced by the Microsoft Visual C++ 6.0 compiler, and  
10888 these values do not include any ACPI driver or OSPM code. The  
10889 debug version of the code includes the debug output trace  
10890 mechanism and has a much larger code and data size. Note that  
10891 these values will vary depending on the efficiency of the compiler  
10892 and the compiler options used during generation.

10894 Previous Release:

```
10896   Non-Debug Version:  73.7K Code,   9.7K Data,   83.4K Total
10897   Debug Version:     156.9K Code,  64.2K Data,  221.1K Total
10898 Current Release:
10899   Non-Debug Version:  73.9K Code,   9.7K Data,   83.6K Total
10900   Debug Version:     157.3K Code,  64.5K Data,  221.8K Total
```

10903 2) Linux:

10905 Fixed the AcpiOsSleep implementation in osunixxf.c to pass the  
10906 correct sleep time in seconds.

```
10908 -----
10909 14 July 2003.  Summary of changes for version 20030619:
```

10911 1) ACPI CA Core Subsystem:

10913 Parse SSDTs in order discovered, as opposed to reverse order  
 10914 (Hrvoje Habjanic)

10916 Fixes from FreeBSD and NetBSD. (Frank van der Linden, Thomas  
 10917 Klausner,  
 10918 Nate Lawson)

10921 2) Linux:

10923 Dynamically allocate SDT list (suggested by Andi Kleen)

10925 proc function return value cleanups (Andi Kleen)

10927 Correctly handle NMI watchdog during long stalls (Andrew Morton)

10929 Make it so acpimp=force works (reported by Andrew Morton)

10932 -----  
 10933 19 June 2003. Summary of changes for version 20030619:

10935 1) ACPI CA Core Subsystem:

10937 Fix To/FromBCD, eliminating the need for an arch-specific #define.

10939 Do not acquire a semaphore in the S5 shutdown path.

10941 Fix ex\_digits\_needed for 0. (Takayoshi Kochi)

10943 Fix sleep/stall code reversal. (Andi Kleen)

10945 Revert a change having to do with control method calling  
 10946 semantics.

10948 2) Linux:

10950 acpiphp update (Takayoshi Kochi)

10952 Export acpi\_disabled for sonypi (Stelian Pop)

10954 Mention acpimp=force in config help

10956 Re-add acpitables.c and acpimp=force. This improves backwards  
 10958 compatibility and also cleans up the code to a significant degree.

10960 Add ASUS Value-add driver (Karol Kozimor and Julien Lerouge)

10962 -----  
 10963 22 May 2003. Summary of changes for version 20030522:

10965 1) ACPI CA Core Subsystem:

10967 Found and fixed a reported problem where an AE\_NOT\_FOUND error  
 10968 occurred occasionally during \_BST evaluation. This turned out to  
 10969 be an Owner ID allocation issue where a called method did not get  
 10970 a new ID assigned to it. Eventually, (after 64k calls), the Owner  
 10971 ID UINT16 would wraparound so that the ID would be the same as the  
 10972 caller's and the called method would delete the caller's  
 10973 namespace.

10975 Implemented extended error reporting for control methods that are  
 10976 aborted due to a run-time exception. Output includes the exact  
 10977 AML instruction that caused the method abort, a dump of the method

10978 locals and arguments at the time of the abort, and a trace of all  
 10979 nested control method calls.

10981 Modified the interpreter to allow the creation of buffers of zero  
 10982 length from the AML code. Implemented new code to ensure that no  
 10983 attempt is made to actually allocate a memory buffer (of length  
 10984 zero) - instead, a simple buffer object with a NULL buffer pointer  
 10985 and length zero is created. A warning is no longer issued when  
 10986 the AML attempts to create a zero-length buffer.

10988 Implemented a workaround for the "leading asterisk issue" in  
 10989 \_HIDs, \_UIDs, and \_CIDs in the AML interpreter. One leading  
 10990 asterisk is automatically removed if present in any HID, UID, or  
 10991 CID strings. The iASL compiler will still flag this asterisk as  
 10992 an error, however.

10994 Implemented full support for \_CID methods that return a package of  
 10995 multiple CIDs (Compatible IDs). The AcpiGetObjectInfo() interface  
 10996 now additionally returns a device \_CID list if present. This  
 10997 required a change to the external interface in order to pass an  
 10998 ACPI\_BUFFER object as a parameter since the \_CID list is of  
 10999 variable length.

11001 Fixed a problem with the new AE\_SAME\_HANDLER exception where  
 11002 handler initialization code did not know about this exception.

11004 Code and Data Size: Current and previous core subsystem library  
 11005 sizes are shown below. These are the code and data sizes for the  
 11006 acpica.lib produced by the Microsoft Visual C++ 6.0 compiler, and  
 11007 these values do not include any ACPI driver or OSPM code. The  
 11008 debug version of the code includes the debug output trace  
 11009 mechanism and has a much larger code and data size. Note that  
 11010 these values will vary depending on the efficiency of the compiler  
 11011 and the compiler options used during generation.

11013 Previous Release (20030509):  
 11014 Non-Debug Version: 73.4K Code, 9.7K Data, 83.1K Total  
 11015 Debug Version: 156.1K Code, 63.9K Data, 220.0K Total  
 11016 Current Release:  
 11017 Non-Debug Version: 73.7K Code, 9.7K Data, 83.4K Total  
 11018 Debug Version: 156.9K Code, 64.2K Data, 221.1K Total

11021 2) Linux:

11023 Fixed a bug in which we would reinitialize the ACPI interrupt  
 11024 after it was already working, thus disabling all ACPI and the IRQs  
 11025 for any other device sharing the interrupt. (Thanks to Stian  
 11026 Jordet)

11028 Toshiba driver update (John Belmonte)

11030 Return only 0 or 1 for our interrupt handler status (Andrew  
 11031 Morton)

11034 3) iASL Compiler:

11036 Fixed a reported problem where multiple (nested) ElseIf()  
 11037 statements were not handled correctly by the compiler, resulting  
 11038 in incorrect warnings and incorrect AML code. This was a problem  
 11039 in both the ASL parser and the code generator.

11042 4) Documentation:

11044 Added changes to existing interfaces, new exception codes, and new  
 11045 text concerning reference count object management versus garbage  
 11046 collection.

11048 -----

11049 09 May 2003. Summary of changes for version 20030509.

#### 11052 1) ACPI CA Core Subsystem:

11054 Changed the subsystem initialization sequence to hold off  
 11055 installation of address space handlers until the hardware has been  
 11056 initialized and the system has entered ACPI mode. This is because  
 11057 the installation of space handlers can cause \_REG methods to be  
 11058 run. Previously, the \_REG methods could potentially be run before  
 11059 ACPI mode was enabled.

11061 Fixed some memory leak issues related to address space handler and  
 11062 notify handler installation. There were some problems with the  
 11063 reference count mechanism caused by the fact that the handler  
 11064 objects are shared across several namespace objects.

11066 Fixed a reported problem where reference counts within the  
 11067 namespace were not properly updated when named objects created by  
 11068 method execution were deleted.

11070 Fixed a reported problem where multiple SSDTs caused a deletion  
 11071 issue during subsystem termination. Restructured the table data  
 11072 structures to simplify the linked lists and the related code.

11074 Fixed a problem where the table ID associated with secondary  
 11075 tables (SSDTs) was not being propagated into the namespace objects  
 11076 created by those tables. This would only present a problem for  
 11077 tables that are unloaded at run-time, however.

11079 Updated AcpiOsReadable and AcpiOsWritable to use the ACPI\_SIZE  
 11080 type as the length parameter (instead of UINT32).

11082 Solved a long-standing problem where an ALREADY\_EXISTS error  
 11083 appears on various systems. This problem could happen when there  
 11084 are multiple PCI\_Config operation regions under a single PCI root  
 11085 bus. This doesn't happen very frequently, but there are some  
 11086 systems that do this in the ASL.

11088 Fixed a reported problem where the internal DeleteNode function  
 11089 was incorrectly handling the case where a namespace node was the  
 11090 first in the parent's child list, and had additional peers (not  
 11091 the only child, but first in the list of children.)

11093 Code and Data Size: Current core subsystem library sizes are shown  
 11094 below. These are the code and data sizes for the acpica.lib  
 11095 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 11096 values do not include any ACPI driver or OSPM code. The debug  
 11097 version of the code includes the debug output trace mechanism and  
 11098 has a much larger code and data size. Note that these values will  
 11099 vary depending on the efficiency of the compiler and the compiler  
 11100 options used during generation.

11102	Previous Release			
11103	Non-Debug Version:	73.7K Code,	9.5K Data,	83.2K Total
11104	Debug Version:	156.1K Code,	63.6K Data,	219.7K Total
11105	Current Release:			
11106	Non-Debug Version:	73.4K Code,	9.7K Data,	83.1K Total
11107	Debug Version:	156.1K Code,	63.9K Data,	220.0K Total

11110 2) Linux:

11112 Allow ":" in OS override string (Ducrot Bruno)

11114 Kobject fix (Greg KH)

#### 11117 3 iASL Compiler/Disassembler:

11119 Fixed a problem in the generation of the C source code files (AML  
 11120 is emitted in C source statements for BIOS inclusion) where the  
 11121 Ascii dump that appears within a C comment at the end of each line  
 11122 could cause a compile time error if the AML sequence happens to  
 11123 have an open comment or close comment sequence embedded.

11126 -----

11127 24 April 2003. Summary of changes for version 20030424.

#### 11130 1) ACPI CA Core Subsystem:

11132 Support for big-endian systems has been implemented. Most of the  
 11133 support has been invisibly added behind big-endian versions of the  
 11134 ACPI\_MOVE\_\* macros.

11136 Fixed a problem in AcpiHwDisableGpeBlock() and  
 11137 AcpiHwClearGpeBlock() where an incorrect offset was passed to the  
 11138 low level hardware write routine. The offset parameter was  
 11139 actually eliminated from the low level read/write routines because  
 11140 they had become obsolete.

11142 Fixed a problem where a handler object was deleted twice during  
 11143 the removal of a fixed event handler.

11146 2) Linux:

11148 A fix for SMP systems with link devices was contributed by

11150 Compaq's Dan Zink.

11152 (2.5) Return whether we handled the interrupt in our IRQ handler.  
 11153 (Linux ISRs no longer return void, so we can propagate the handler  
 11154 return value from the ACPI CA core back to the OS.)

#### 11158 3) Documentation:

11160 The ACPI CA Programmer Reference has been updated to reflect new  
 11161 interfaces and changes to existing interfaces.

11163 -----

11164 28 March 2003. Summary of changes for version 20030328.

#### 11166 1) ACPI CA Core Subsystem:

11168 The GPE Block Device support has been completed. New interfaces  
 11169 are AcpiInstallGpeBlock and AcpiRemoveGpeBlock. The Event  
 11170 interfaces (enable, disable, clear, getstatus) have been split  
 11171 into separate interfaces for Fixed Events and General Purpose  
 11172 Events (GPEs) in order to support GPE Block Devices properly.

11174 Fixed a problem where the error message "Failed to acquire  
 11175 semaphore" would appear during operations on the embedded

11176 controller (EC).

11178 Code and Data Size: Current core subsystem library sizes are shown  
11179 below. These are the code and data sizes for the acpica.lib  
11180 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11181 values do not include any ACPI driver or OSPM code. The debug  
11182 version of the code includes the debug output trace mechanism and  
11183 has a much larger code and data size. Note that these values will  
11184 vary depending on the efficiency of the compiler and the compiler  
11185 options used during generation.

11187	Previous Release			
11188	Non-Debug Version:	72.3K Code,	9.5K Data,	81.8K Total
11189	Debug Version:	154.0K Code,	63.4K Data,	217.4K Total
11190	Current Release:			
11191	Non-Debug Version:	73.7K Code,	9.5K Data,	83.2K Total
11192	Debug Version:	156.1K Code,	63.6K Data,	219.7K Total

11195 -----  
11196 28 February 2003. Summary of changes for version 20030228.

11199 1) ACPI CA Core Subsystem:

11201 The GPE handling and dispatch code has been completely overhauled  
11202 in preparation for support of GPE Block Devices (ID ACPI0006).  
11203 This affects internal data structures and code only; there should  
11204 be no differences visible externally. One new file has been  
11205 added, evgpeblk.c

11207 The FADT fields GPE0\_BLK\_LEN and GPE1\_BLK\_LEN are now the only  
11208 fields that are used to determine the GPE block lengths. The  
11209 REGISTER\_BIT\_WIDTH field of the X\_GPEX\_BLK extended address  
11210 structures are ignored. This is per the ACPI specification but it  
11211 isn't very clear. The full 256 Block 0/1 GPEs are now supported  
11212 (the use of REGISTER\_BIT\_WIDTH limited the number of GPEs to 128).

11214 In the SCI interrupt handler, removed the read of the PM1\_CONTROL  
11215 register to look at the SCI\_EN bit. On some machines, this read  
11216 causes an SMI event and greatly slows down SCI events. (This may  
11217 in fact be the cause of slow battery status response on some  
11218 systems.)

11220 Fixed a problem where a store of a NULL string to a package object  
11221 could cause the premature deletion of the object. This was seen  
11222 during execution of the battery\_BIF method on some systems,  
11223 resulting in no battery data being returned.

11225 Added AcpiWalkResources interface to simplify parsing of resource  
11226 lists.

11228 Code and Data Size: Current core subsystem library sizes are shown  
11229 below. These are the code and data sizes for the acpica.lib  
11230 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11231 values do not include any ACPI driver or OSPM code. The debug  
11232 version of the code includes the debug output trace mechanism and  
11233 has a much larger code and data size. Note that these values will  
11234 vary depending on the efficiency of the compiler and the compiler  
11235 options used during generation.

11237	Previous Release			
11238	Non-Debug Version:	72.0K Code,	9.5K Data,	81.5K Total
11239	Debug Version:	153.0K Code,	62.9K Data,	215.9K Total
11240	Current Release:			
11241	Non-Debug Version:	72.3K Code,	9.5K Data,	81.8K Total

11242 Debug Version: 154.0K Code, 63.4K Data, 217.4K Total

11245 2) Linux

11247 S3 fixes (Ole Rohne)

11249 Update ACPI PHP driver with to use new acpi\_walk\_resource API  
11250 (Bjorn Helgaas)

11252 Add S4BIOS support (Pavel Machek)

11254 Map in entire table before performing checksum (John Stultz)

11256 Expand the mem= cmdline to allow the specification of reserved and  
11257 ACPI DATA blocks (Pavel Machek)

11259 Never use ACPI on VISWS

11261 Fix derive\_pci\_id (Ducrot Bruno, Alvaro Lopez)

11263 Revert a change that allowed P\_BLK lengths to be 4 or 5. This is  
11264 causing us to think that some systems support C2 when they really  
11265 don't.

11267 Do not count processor objects for non-present CPUs (Thanks to  
11268 Dominik Brodowski)

11271 3) iASL Compiler:

11273 Fixed a problem where ASL include files could not be found and  
11274 opened.

11276 Added support for the \_PDC reserved name.

11279 -----  
11280 22 January 2003. Summary of changes for version 20030122.

11283 1) ACPI CA Core Subsystem:

11285 Added a check for constructs of the form: Store (Local0, Local0)  
11286 where Local0 is not initialized. Apparently, some BIOS  
11287 programmers believe that this is a NOOP. Since this store doesn't  
11288 do anything anyway, the new prototype behavior will ignore this  
11289 error. This is a case where we can relax the strict checking in  
11290 the interpreter in the name of compatibility.

11293 2) Linux

11295 The AcpiSrc Source Conversion Utility has been released with the  
11296 Linux package for the first time. This is the utility that is  
11297 used to convert the ACPI CA base source code to the Linux version.

11299 (Both) Handle P\_BLK lengths shorter than 6 more gracefully

11301 (Both) Move more headers to include/acpi, and delete an unused  
11302 header.

11304 (Both) Move drivers/acpi/include directory to include/acpi

11306 (Both) Boot functions don't use cmdline, so don't pass it around

11308 (Both) Remove include of unused header (Adrian Bunk)

11310 (Both) acpiphp.h includes both linux/acpi.h and acpi\_bus.h. Since  
11311 the  
11312 former now also includes the latter, acpiphp.h only needs the one,  
11313 now.

11315 (2.5) Make it possible to select method of bios restoring after S3  
11316 resume. [=> no more ugly ifdefs] (Pavel Machek)

11318 (2.5) Make proc write interfaces work (Pavel Machek)

11320 (2.5) Properly init/clean up in cpufreq/acpi (Dominik Brodowski)

11322 (2.5) Break out ACPI Perf code into its own module, under cpufreq  
11323 (Dominik Brodowski)

11325 (2.4) S4BIOS support (Ducrot Bruno)

11327 (2.4) Fix acpiphp\_glue.c for latest ACPI struct changes (Sergio  
11328 Visinoni)

11331 3) iASL Compiler:

11333 Added support to disassemble SSDT and PSDTs.

11335 Implemented support to obtain SSDTs from the Windows registry if  
11336 available.

11339 -----  
11340 09 January 2003. Summary of changes for version 20030109.

11342 1) ACPI CA Core Subsystem:

11344 Changed the behavior of the internal Buffer-to-String conversion  
11345 function. The current ACPI specification states that the contents  
11346 of the buffer are "converted to a string of two-character  
11347 hexadecimal numbers, each separated by a space". Unfortunately,  
11348 this definition is not backwards compatible with existing ACPI 1.0  
11349 implementations (although the behavior was not defined in the ACPI  
11350 1.0 specification). The new behavior simply copies data from the  
11351 buffer to the string until a null character is found or the end of  
11352 the buffer is reached. The new String object is always null  
11353 terminated. This problem was seen during the generation of \_BIF  
11354 battery data where incorrect strings were returned for battery  
11355 type, etc. This will also require an errata to the ACPI  
11356 specification.

11358 Renamed all instances of NATIVE\_UINT and NATIVE\_INT to  
11359 ACPI\_NATIVE\_UINT and ACPI\_NATIVE\_INT, respectively.

11361 Copyright in all module headers (both Linux and non-Linux) has be  
11362 updated to 2003.

11364 Code and Data Size: Current core subsystem library sizes are shown  
11365 below. These are the code and data sizes for the acpica.lib  
11366 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11367 values do not include any ACPI driver or OSPM code. The debug  
11368 version of the code includes the debug output trace mechanism and  
11369 has a much larger code and data size. Note that these values will  
11370 vary depending on the efficiency of the compiler and the compiler  
11371 options used during generation.

11373 Previous Release

11374 Non-Debug Version: 72.0K Code, 9.5K Data, 81.5K Total  
11375 Debug Version: 153.0K Code, 62.9K Data, 215.9K Total  
11376 Current Release:  
11377 Non-Debug Version: 72.0K Code, 9.5K Data, 81.5K Total  
11378 Debug Version: 153.0K Code, 62.9K Data, 215.9K Total

11381 2) Linux

11383 Fixed an oops on module insertion/removal (Matthew Tippet)

11385 (2.4) Fix to handle dynamic size of mp\_irqs (Joerg Prante)

11387 (2.5) Replace pr\_debug (Randy Dunlap)

11389 (2.5) Remove usage of CPUFREQ\_ALL\_CPUS (Dominik Brodowski)

11391 (Both) Eliminate spawning of thread from timer callback, in favor  
11392 of schedule\_work()

11394 (Both) Show Lid status in /proc (Zdenek OGAR Skalak)

11396 (Both) Added define for Fixed Function HW region (Matthew Wilcox)

11398 (Both) Add missing statics to button.c (Pavel Machek)

11400 Several changes have been made to the source code translation  
11401 utility that generates the Linux Code in order to make the code  
11402 more "Linux-like":

11404 All typedefs on structs and unions have been removed in keeping  
11405 with the Linux coding style.

11407 Removed the non-Linux SourceSafe module revision number from each  
11408 module header.

11410 Completed major overhaul of symbols to be lowercased for linux.  
11411 Doubled the number of symbols that are lowercased.

11413 Fixed a problem where identifiers within procedure headers and  
11414 within quotes were not fully lower cased (they were left with a  
11415 starting capital.)

11417 Some C macros whose only purpose is to allow the generation of 16-  
11418 bit code are now completely removed in the Linux code, increasing  
11419 readability and maintainability.

11421 -----

11423 12 December 2002. Summary of changes for version 20021212.

11426 1) ACPI CA Core Subsystem:

11428 Fixed a problem where the creation of a zero-length AML Buffer  
11429 would cause a fault.

11431 Fixed a problem where a Buffer object that pointed to a static AML  
11432 buffer (in an ACPI table) could inadvertently be deleted, causing  
11433 memory corruption.

11435 Fixed a problem where a user buffer (passed in to the external  
11436 ACPI CA interfaces) could be overwritten if the buffer was too  
11437 small to complete the operation, causing memory corruption.

11439 Fixed a problem in the Buffer-to-String conversion code where a

11440 string of length one was always returned, regardless of the size  
11441 of the input Buffer object.

11443 Removed the NATIVE\_CHAR data type across the entire source due to  
11444 lack of need and lack of consistent use.

11446 Code and Data Size: Current core subsystem library sizes are shown  
11447 below. These are the code and data sizes for the acpica.lib  
11448 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11449 values do not include any ACPI driver or OSPM code. The debug  
11450 version of the code includes the debug output trace mechanism and  
11451 has a much larger code and data size. Note that these values will  
11452 vary depending on the efficiency of the compiler and the compiler  
11453 options used during generation.

11455	Previous Release			
11456	Non-Debug Version:	72.1K Code,	9.5K Data,	81.6K Total
11457	Debug Version:	152.7K Code,	62.7K Data,	215.4K Total
11458	Current Release:			
11459	Non-Debug Version:	72.0K Code,	9.5K Data,	81.5K Total
11460	Debug Version:	153.0K Code,	62.9K Data,	215.9K Total

11463 -----  
11464 05 December 2002. Summary of changes for version 20021205.

#### 11466 1) ACPI CA Core Subsystem:

11468 Fixed a problem where a store to a String or Buffer object could  
11469 cause corruption of the DSDT if the object type being stored was  
11470 the same as the target object type and the length of the object  
11471 being stored was equal to or smaller than the original (existing)  
11472 target object. This was seen to cause corruption of battery \_BIF  
11473 buffers if the \_BIF method modified the buffer on the fly.

11475 Fixed a problem where an internal error was generated if a control  
11476 method invocation was used in an OperationRegion, Buffer, or  
11477 Package declaration. This was caused by the deferred parsing of  
11478 the control method and thus the deferred creation of the internal  
11479 method object. The solution to this problem was to create the  
11480 internal method object at the moment the method is encountered in  
11481 the first pass - so that subsequent references to the method will  
11482 be able to obtain the required parameter count and thus properly  
11483 parse the method invocation. This problem presented itself as an  
11484 AE\_AML\_INTERNAL during the pass 1 parse phase during table load.

11486 Fixed a problem where the internal String object copy routine did  
11487 not always allocate sufficient memory for the target String object  
11488 and caused memory corruption. This problem was seen to cause  
11489 "Allocation already present in list!" errors as memory allocation  
11490 became corrupted.

11492 Implemented a new function for the evaluation of namespace objects  
11493 that allows the specification of the allowable return object  
11494 types. This simplifies a lot of code that checks for a return  
11495 object of one or more specific objects returned from the  
11496 evaluation (such as \_STA, etc.) This may become an external  
11497 function if it would be useful to ACPI-related drivers.

11499 Completed another round of prefixing #defines with "ACPI\_" for  
11500 clarity.

11502 Completed additional code restructuring to allow more modular  
11503 linking for iASL compiler and AcpiExec. Several files were split  
11504 creating new files. New files: nsparse.c dsinit.c evgpe.c

11506 Implemented an abort mechanism to terminate an executing control  
11507 method via the AML debugger. This feature is useful for debugging  
11508 control methods that depend (wait) for specific hardware  
11509 responses.

11511 Code and Data Size: Current core subsystem library sizes are shown  
11512 below. These are the code and data sizes for the acpica.lib  
11513 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11514 values do not include any ACPI driver or OSPM code. The debug  
11515 version of the code includes the debug output trace mechanism and  
11516 has a much larger code and data size. Note that these values will  
11517 vary depending on the efficiency of the compiler and the compiler  
11518 options used during generation.

11520	Previous Release			
11521	Non-Debug Version:	71.4K Code,	9.0K Data,	80.4K Total
11522	Debug Version:	152.9K Code,	63.3K Data,	216.2K Total
11523	Current Release:			
11524	Non-Debug Version:	72.1K Code,	9.5K Data,	81.6K Total
11525	Debug Version:	152.7K Code,	62.7K Data,	215.4K Total

#### 11528 2) iASL Compiler/Disassembler

11530 Fixed a compiler code generation problem for "Interrupt" Resource  
11531 Descriptors. If specified in the ASL, the optional "Resource  
11532 Source Index" and "Resource Source" fields were not inserted into  
11533 the correct location within the AML resource descriptor, creating  
11534 an invalid descriptor.

11536 Fixed a disassembler problem for "Interrupt" resource descriptors.  
11537 The optional "Resource Source Index" and "Resource Source" fields  
11538 were ignored.

11541 -----  
11542 22 November 2002. Summary of changes for version 20021122.

#### 11545 1) ACPI CA Core Subsystem:

11547 Fixed a reported problem where an object stored to a Method Local  
11548 or Arg was not copied to a new object during the store - the  
11549 object pointer was simply copied to the Local/Arg. This caused  
11550 all subsequent operations on the Local/Arg to also affect the  
11551 original source of the store operation.

11553 Fixed a problem where a store operation to a Method Local or Arg  
11554 was not completed properly if the Local/Arg contained a reference  
11555 (from RefOf) to a named field. The general-purpose store-to-  
11556 namespace-node code is now used so that this case is handled  
11557 automatically.

11559 Fixed a problem where the internal object copy routine would cause  
11560 a protection fault if the object being copied was a Package and  
11561 contained either 1) a NULL package element or 2) a nested sub-  
11562 package.

11564 Fixed a problem with the GPE initialization that resulted from an  
11565 ambiguity in the ACPI specification. One section of the  
11566 specification states that both the address and length of the GPE  
11567 block must be zero if the block is not supported. Another section  
11568 implies that only the address need be zero if the block is not  
11569 supported. The code has been changed so that both the address and  
11570 the length must be non-zero to indicate a valid GPE block (i.e.,  
11571 if either the address or the length is zero, the GPE block is

11572 invalid.)

11574 Code and Data Size: Current core subsystem library sizes are shown  
11575 below. These are the code and data sizes for the acpica.lib  
11576 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11577 values do not include any ACPI driver or OSPM code. The debug  
11578 version of the code includes the debug output trace mechanism and  
11579 has a much larger code and data size. Note that these values will  
11580 vary depending on the efficiency of the compiler and the compiler  
11581 options used during generation.

11583	Previous Release			
11584	Non-Debug Version:	71.3K Code,	9.0K Data,	80.3K Total
11585	Debug Version:	152.7K Code,	63.2K Data,	215.5K Total
11586	Current Release:			
11587	Non-Debug Version:	71.4K Code,	9.0K Data,	80.4K Total
11588	Debug Version:	152.9K Code,	63.3K Data,	216.2K Total

11591 2) Linux

11593 Cleaned up EC driver. Exported an external EC read/write  
11594 interface. By going through this, other drivers (most notably  
11595 sonypi) will be able to serialize access to the EC.

11598 3) iASL Compiler/Disassembler

11600 Implemented support to optionally generate include files for both  
11601 ASM and C (the -i switch). This simplifies BIOS development by  
11602 automatically creating include files that contain external  
11603 declarations for the symbols that are created within the

11605 (optionally generated) ASM and C AML source files.

11608 -----  
11609 15 November 2002. Summary of changes for version 20021115.

11611 1) ACPI CA Core Subsystem:

11613 Fixed a memory leak problem where an error during resolution of

11615 method arguments during a method invocation from another method  
11616 failed to cleanup properly by deleting all successfully resolved  
11617 argument objects.

11619 Fixed a problem where the target of the Index() operator was not  
11620 correctly constructed if the source object was a package. This  
11621 problem has not been detected because the use of a target operand  
11622 with Index() is very rare.

11624 Fixed a problem with the Index() operator where an attempt was  
11625 made to delete the operand objects twice.

11627 Fixed a problem where an attempt was made to delete an operand  
11628 twice during execution of the CondRefOf() operator if the target  
11629 did not exist.

11631 Implemented the first of perhaps several internal create object  
11632 functions that create and initialize a specific object type. This  
11633 consolidates duplicated code wherever the object is created, thus  
11634 shrinking the size of the subsystem.

11636 Implemented improved debug/error messages for errors that occur  
11637 during nested method invocations. All executing method pathnames

11638 are displayed (with the error) as the call stack is unwound - thus  
11639 simplifying debug.

11641 Fixed a problem introduced in the 10/02 release that caused  
11642 premature deletion of a buffer object if a buffer was used as an  
11643 ASL operand where an integer operand is required (Thus causing an  
11644 implicit object conversion from Buffer to Integer.) The change in  
11645 the 10/02 release was attempting to fix a memory leak (albeit  
11646 incorrectly.)

11648 Code and Data Size: Current core subsystem library sizes are shown  
11649 below. These are the code and data sizes for the acpica.lib  
11650 produced by the Microsoft Visual C++ 6.0 compiler, and these  
11651 values do not include any ACPI driver or OSPM code. The debug  
11652 version of the code includes the debug output trace mechanism and  
11653 has a much larger code and data size. Note that these values will  
11654 vary depending on the efficiency of the compiler and the compiler  
11655 options used during generation.

11657	Previous Release			
11658	Non-Debug Version:	71.9K Code,	9.1K Data,	81.0K Total
11659	Debug Version:	153.1K Code,	63.3K Data,	216.4K Total
11660	Current Release:			
11661	Non-Debug Version:	71.3K Code,	9.0K Data,	80.3K Total
11662	Debug Version:	152.7K Code,	63.2K Data,	215.5K Total

11665 2) Linux

11667 Changed the implementation of the ACPI semaphores to use down()  
11668 instead of down\_interruptable(). It is important that the  
11669 execution of ACPI control methods not be interrupted by signals.  
11670 Methods must run to completion, or the system may be left in an  
11671 unknown/unstable state.

11673 Fixed a compilation error when CONFIG\_SOFTWARE\_SUSPEND is not set.  
11674 (Shawn Starr)

11677 3) iASL Compiler/Disassembler

11680 Changed the default location of output files. All output files  
11681 are now placed in the current directory by default instead of in  
11682 the directory of the source file. This change may affect some  
11683 existing makefiles, but it brings the behavior of the compiler in  
11684 line with other similar tools. The location of the output files  
11685 can be overridden with the -p command line switch.

11688 -----  
11689 11 November 2002. Summary of changes for version 20021111.

11692 0) ACPI Specification 2.0B is released and is now available at:  
11693 <http://www.acpi.info/index.html>

11696 1) ACPI CA Core Subsystem:

11698 Implemented support for the ACPI 2.0 SMBus Operation Regions.  
11699 This includes the early detection and handoff of the request to  
11700 the SMBus region handler (avoiding all of the complex field  
11701 support code), and support for the bidirectional return packet  
11702 from an SMBus write operation. This paves the way for the  
11703 development of SMBus drivers in each host operating system.

11705 Fixed a problem where the semaphore WAIT\_FOREVER constant was  
 11706 defined as 32 bits, but must be 16 bits according to the ACPI  
 11707 specification. This had the side effect of causing ASL  
 11708 Mutex/Event timeouts even though the ASL code requested a wait  
 11709 forever. Changed all internal references to the ACPI timeout  
 11710 parameter to 16 bits to prevent future problems. Changed the name  
 11711 of WAIT\_FOREVER to ACPI\_WAIT\_FOREVER.

11713 Code and Data Size: Current core subsystem library sizes are shown  
 11714 below. These are the code and data sizes for the acpica.lib  
 11715 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 11716 values do not include any ACPI driver or OSPM code. The debug  
 11717 version of the code includes the debug output trace mechanism and  
 11718 has a much larger code and data size. Note that these values will  
 11719 vary depending on the efficiency of the compiler and the compiler  
 11720 options used during generation.

11722	Previous Release			
11723	Non-Debug Version:	71.4K Code,	9.0K Data,	80.4K Total
11724	Debug Version:	152.3K Code,	63.0K Data,	215.3K Total
11725	Current Release:			
11726	Non-Debug Version:	71.9K Code,	9.1K Data,	81.0K Total
11727	Debug Version:	153.1K Code,	63.3K Data,	216.4K Total

11730 2) Linux

11732 Module loading/unloading fixes (John Cagle)

11735 3) iASL Compiler/Disassembler

11737 Added support for the SMBBlockProcessCall keyword (ACPI 2.0)

11739 Implemented support for the disassembly of all SMBus protocol  
 11740 keywords (SMBQuick, SMBWord, etc.)

11742 -----

11743 01 November 2002. Summary of changes for version 20021101.

11746 1) ACPI CA Core Subsystem:

11748 Fixed a problem where platforms that have a GPE1 block but no GPE0  
 11749 block were not handled correctly. This resulted in a "GPE  
 11750 overlap" error message. GPE0 is no longer required.

11752 Removed code added in the previous release that inserted nodes  
 11753 into the namespace in alphabetical order. This caused some side-  
 11754 effects on various machines. The root cause of the problem is  
 11755 still under investigation since in theory, the internal ordering  
 11756 of the namespace nodes should not matter.

11759 Enhanced error reporting for the case where a named object is not  
 11760 found during control method execution. The full ACPI namepath  
 11761 (name reference) of the object that was not found is displayed in  
 11762 this case.

11764 Note: as a result of the overhaul of the namespace object types in  
 11765 the previous release, the namespace nodes for the predefined  
 11766 scopes (\_TZ, \_PR, etc.) are now of the type ACPI\_TYPE\_LOCAL\_SCOPE  
 11767 instead of ACPI\_TYPE\_ANY. This simplifies the namespace  
 11768 management code but may affect code that walks the namespace tree  
 11769 looking for specific object types.

11771 Code and Data Size: Current core subsystem library sizes are shown  
 11772 below. These are the code and data sizes for the acpica.lib  
 11773 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 11774 values do not include any ACPI driver or OSPM code. The debug  
 11775 version of the code includes the debug output trace mechanism and  
 11776 has a much larger code and data size. Note that these values will  
 11777 vary depending on the efficiency of the compiler and the compiler  
 11778 options used during generation.

11780	Previous Release			
11781	Non-Debug Version:	70.7K Code,	8.6K Data,	79.3K Total
11782	Debug Version:	151.7K Code,	62.4K Data,	214.1K Total
11783	Current Release:			
11784	Non-Debug Version:	71.4K Code,	9.0K Data,	80.4K Total
11785	Debug Version:	152.3K Code,	63.0K Data,	215.3K Total

11788 2) Linux

11790 Fixed a problem introduced in the previous release where the  
 11791 Processor and Thermal objects were not recognized and installed in  
 11792 /proc. This was related to the scope type change described above.

11795 3) iASL Compiler/Disassembler

11797 Implemented the -g option to get all of the required ACPI tables  
 11798 from the registry and save them to files (Windows version of the  
 11799 compiler only.) The required tables are the FADT, FACS, and DSDT.

11801 Added ACPI table checksum validation during table disassembly in  
 11802 order to catch corrupted tables.

11805 -----

11806 22 October 2002. Summary of changes for version 20021022.

11808 1) ACPI CA Core Subsystem:

11810 Implemented a restriction on the Scope operator that the target  
 11811 must already exist in the namespace at the time the operator is  
 11812 encountered (during table load or method execution). In other  
 11813 words, forward references are not allowed and Scope() cannot  
 11814 create a new object. This changes the previous behavior where the  
 11815 interpreter would create the name if not found. This new behavior  
 11816 correctly enables the search-to-root algorithm during namespace  
 11817 lookup of the target name. Because of this upsearch, this fixes  
 11818 the known Compaq \_SB\_.OKEC problem and makes both the AML  
 11819 interpreter and iASL compiler compatible with other ACPI  
 11820 implementations.

11822 Completed a major overhaul of the internal ACPI object types for  
 11823 the ACPI Namespace and the associated operand objects. Many of  
 11824 these types had become obsolete with the introduction of the two-  
 11825 pass namespace load. This cleanup simplifies the code and makes  
 11826 the entire namespace load mechanism much clearer and easier to  
 11827 understand.

11829 Improved debug output for tracking scope opening/closing to help  
 11830 diagnose scoping issues. The old scope name as well as the new  
 11831 scope name are displayed. Also improved error messages for  
 11832 problems with ASL Mutex objects and error messages for GPE  
 11833 problems.

11835 Cleaned up the namespace dump code, removed obsolete code.

11837 All string output (for all namespace/object dumps) now uses the  
 11838 common ACPI string output procedure which handles escapes properly  
 11839 and does not emit non-printable characters.

11841 Fixed some issues with constants in the 64-bit version of the  
 11842 local C library (utclib.c)

11845 2) Linux

11847 EC Driver: No longer attempts to acquire the Global Lock at  
 11848 interrupt level.

11851 3) iASL Compiler/Disassembler

11853 Implemented ACPI 2.0B grammar change that disallows all Type 1 and  
 11854 2 opcodes outside of a control method. This means that the  
 11855 "executable" operators (versus the "namespace" operators) cannot  
 11856 be used at the table level; they can only be used within a control  
 11857 method.

11859 Implemented the restriction on the Scope() operator where the  
 11860 target must already exist in the namespace at the time the  
 11861 operator is encountered (during ASL compilation). In other words,  
 11862 forward references are not allowed and Scope() cannot create a new  
 11863 object. This makes the iASL compiler compatible with other ACPI  
 11864 implementations and makes the Scope() implementation adhere to the  
 11865 ACPI specification.

11867 Fixed a problem where namepath optimization for the Alias operator  
 11868 was optimizing the wrong path (of the two namepaths.) This caused  
 11869 a "Missing alias link" error message.

11871 Fixed a problem where an "unknown reserved name" warning could be  
 11872 incorrectly generated for names like "\_SB" when the trailing  
 11873 underscore is not used in the original ASL.

11875 Fixed a problem where the reserved name check did not handle  
 11876 NamePaths with multiple NameSegs correctly. The first nameseg of  
 11877 the NamePath was examined instead of the last NameSeg.

11880 -----

11882 02 October 2002. Summary of changes for this release.

11885 1) ACPI CA Core Subsystem version 20021002:

11887 Fixed a problem where a store/copy of a string to an existing  
 11888 string did not always set the string length properly in the String  
 11889 object.

11891 Fixed a reported problem with the ToString operator where the  
 11892 behavior was identical to the ToHexString operator instead of just  
 11893 simply converting a raw buffer to a string data type.

11895 Fixed a problem where CopyObject and the other "explicit"  
 11896 conversion operators were not updating the internal namespace node  
 11897 type as part of the store operation.

11899 Fixed a memory leak during implicit source operand conversion  
 11900 where the original object was not deleted if it was converted to a  
 11901 new object of a different type.

11903 Enhanced error messages for all problems associated with namespace  
 11904 lookups. Common procedure generates and prints the lookup name as  
 11905 well as the formatted status.

11907 Completed implementation of a new design for the Alias support  
 11908 within the namespace. The existing design did not handle the case  
 11909 where a new object was assigned to one of the two names due to the  
 11910 use of an explicit conversion operator, resulting in the two names  
 11911 pointing to two different objects. The new design simply points  
 11912 the Alias name to the original name node - not to the object.  
 11913 This results in a level of indirection that must be handled in the  
 11914 name resolution mechanism.

11916 Code and Data Size: Current core subsystem library sizes are shown  
 11917 below. These are the code and data sizes for the acpica.lib  
 11918 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 11919 values do not include any ACPI driver or OSPM code. The debug  
 11920 version of the code includes the debug output trace mechanism and  
 11921 has a larger code and data size. Note that these values will vary  
 11922 depending on the efficiency of the compiler and the compiler  
 11923 options used during generation.

11925	Previous Release			
11926	Non-Debug Version:	69.6K Code,	8.3K Data,	77.9K Total
11927	Debug Version:	150.0K Code,	61.7K Data,	211.7K Total
11928	Current Release:			
11929	Non-Debug Version:	70.7K Code,	8.6K Data,	79.3K Total
11930	Debug Version:	151.7K Code,	62.4K Data,	214.1K Total

11933 2) Linux

11935 Initialize thermal driver's timer before it is used. (Knut  
 11936 Neumann)

11938 Allow handling negative celsius values. (Kochi Takayoshi)

11940 Fix thermal management and make trip points. R/W (Pavel Machek)

11942 Fix /proc/acpi/sleep. (P. Christeas)

11944 IA64 fixes. (David Mosberger)

11946 Fix reversed logic in blacklist code. (Sergio Monteiro Basto)

11948 Replace ACPI\_DEBUG define with ACPI\_DEBUG\_OUTPUT. (Dominik  
 11949 Brodowski)

11952 3) iASL Compiler/Disassembler

11954 Clarified some warning/error messages.

11957 -----

11958 18 September 2002. Summary of changes for this release.

11961 1) ACPI CA Core Subsystem version 20020918:

11963 Fixed a reported problem with reference chaining (via the Index()  
 11964 and RefOf() operators) in the ObjectType() and SizeOf() operators.  
 11965 The definition of these operators includes the dereferencing of  
 11966 all chained references to return information on the base object.

11968 Fixed a problem with stores to indexed package elements - the  
 11969 existing code would not complete the store if an "implicit  
 11970 conversion" was not performed. In other words, if the existing  
 11971 object (package element) was to be replaced completely, the code  
 11972 didn't handle this case.

11974 Relaxed typechecking on the ASL "Scope" operator to allow the  
 11975 target name to refer to an object of type Integer, String, or  
 11976 Buffer, in addition to the scoping object types (Device,  
 11977 predefined Scopes, Processor, PowerResource, and ThermalZone.)  
 11978 This allows existing AML code that has workarounds for a bug in  
 11979 Windows to function properly. A warning is issued, however. This  
 11980 affects both the AML interpreter and the iASL compiler. Below is  
 11981 an example of this type of ASL code:

```
11983      Name(DEV,0x00)
11984      Scope(DEV)
11985      {
```

11987 Fixed some reported problems with 64-bit integer support in the  
 11988 local implementation of C library functions (clib.c)

11991 2) Linux

11993 Use ACPI fix map region instead of IOAPIC region, since it is  
 11994 undefined in non-SMP.

11996 Ensure that the SCI has the proper polarity and trigger, even on  
 11997 systems that do not have an interrupt override entry in the MADT.

11999 2.5 big driver reorganization (Pat Mochel)

12001 Use early table mapping code from acpitab.c (Andi Kleen)

12003 New blacklist entries (Andi Kleen)

12005 Blacklist improvements. Split blacklist code out into a separate  
 12006 file. Move checking the blacklist to very early. Previously, we  
 12007 would use ACPI tables, and then halfway through init, check the  
 12008 blacklist -- too late. Now, it's early enough to completely fall-  
 12009 back to non-ACPI.

12012 3) iASL Compiler/Disassembler version 20020918:

12014 Fixed a problem where the typechecking code didn't know that an  
 12015 alias could point to a method. In other words, aliases were not  
 12016 being dereferenced during typechecking.

12019 -----

12020 29 August 2002. Summary of changes for this release.

12022 1) ACPI CA Core Subsystem Version 20020829:

12024 If the target of a Scope() operator already exists, it must be an  
 12025 object type that actually opens a scope -- such as a Device,  
 12026 Method, Scope, etc. This is a fatal runtime error. Similar error  
 12027 check has been added to the iASL compiler also.

12029 Tightened up the namespace load to disallow multiple names in the  
 12030 same scope. This previously was allowed if both objects were of  
 12031 the same type. (i.e., a lookup was the same as entering a new  
 12032 name).

12035 2) Linux

12037 Ensure that the ACPI interrupt has the proper trigger and  
 12038 polarity.

12040 local\_irq\_disable is extraneous. (Matthew Wilcox)

12042 Make "acpi=off" actually do what it says, and not use the ACPI  
 12043 interpreter \*or\* the tables.

12045 Added arch-neutral support for parsing SLIT and SRAT tables (Kochi  
 12046 Takayoshi)

12049 3) iASL Compiler/Disassembler Version 20020829:

12051 Implemented namepath optimization for name declarations. For  
 12052 example, a declaration like "Method (\\_SB\_.ABCD)" would get  
 12053 optimized to "Method (ABCD)" if the declaration is within the  
 12054 \\_SB\_ scope. This optimization is in addition to the named  
 12055 reference path optimization first released in the previous  
 12056 version. This would seem to complete all possible optimizations  
 12057 for namepaths within the ASL/AML.

12059 If the target of a Scope() operator already exists, it must be an  
 12060 object type that actually opens a scope -- such as a Device,  
 12061 Method, Scope, etc.

12063 Implemented a check and warning for unreachable code in the same  
 12064 block below a Return() statement.

12066 Fixed a problem where the listing file was not generated if the  
 12067 compiler aborted if the maximum error count was exceeded (200).

12069 Fixed a problem where the typechecking of method return values was  
 12070 broken. This includes the check for a return value when the  
 12071 method is invoked as a TermArg (a return value is expected.)

12073 Fixed a reported problem where EOF conditions during a quoted  
 12074 string or comment caused a fault.

12077 -----

12078 15 August 2002. Summary of changes for this release.

12080 1) ACPI CA Core Subsystem Version 20020815:

12082 Fixed a reported problem where a Store to a method argument that  
 12083 contains a reference did not perform the indirect store correctly.  
 12084 This problem was created during the conversion to the new  
 12085 reference object model - the indirect store to a method argument  
 12086 code was not updated to reflect the new model.

12088 Reworked the ACPI mode change code to better conform to ACPI 2.0,  
 12089 handle corner cases, and improve code legibility (Kochi Takayoshi)

12091 Fixed a problem with the pathname parsing for the carat (^)  
 12092 prefix. The heavy use of the carat operator by the new namepath  
 12093 optimization in the iASL compiler uncovered a problem with the AML  
 12094 interpreter handling of this prefix. In the case where one or  
 12095 more carats precede a single nameseg, the nameseg was treated as  
 12096 standalone and the search rule (to root) was inadvertently  
 12097 applied. This could cause both the iASL compiler and the  
 12098 interpreter to find the wrong object or to miss the error that  
 12099 should occur if the object does not exist at that exact pathname.

12101 Found and fixed the problem where the HP Pavilion DSDT would not  
 12102 load. This was a relatively minor tweak to the table loading code  
 12103 (a problem caused by the unexpected encounter with a method  
 12104 invocation not within a control method), but it does not solve the  
 12105 overall issue of the execution of AML code at the table level.  
 12106 This investigation is still ongoing.

12108 Code and Data Size: Current core subsystem library sizes are shown  
 12109 below. These are the code and data sizes for the acpica.lib  
 12110 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 12111 values do not include any ACPI driver or OSPM code. The debug  
 12112 version of the code includes the debug output trace mechanism and  
 12113 has a larger code and data size. Note that these values will vary  
 12114 depending on the efficiency of the compiler and the compiler  
 12115 options used during generation.

12117	Previous Release			
12118	Non-Debug Version:	69.1K Code,	8.2K Data,	77.3K Total
12119	Debug Version:	149.4K Code,	61.6K Data,	211.0K Total
12120	Current Release:			
12121	Non-Debug Version:	69.6K Code,	8.3K Data,	77.9K Total
12122	Debug Version:	150.0K Code,	61.7K Data,	211.7K Total

12125 2) Linux

12127 Remove redundant slab.h include (Brad Hards)

12129 Fix several bugs in thermal.c (Herbert Nachtnebel)

12131 Make CONFIG\_ACPI\_BOOT work properly (Pavel Machek)

12133 Change acpi\_system\_suspend to use updated irq functions (Pavel  
 12134 Machek)

12136 Export acpi\_get\_firmware\_table (Matthew Wilcox)

12138 Use proper root proc entry for ACPI (Kochi Takayoshi)

12140 Fix early-boot table parsing (Bjorn Helgaas)

12143 3) iASL Compiler/Disassembler

12145 Reworked the compiler options to make them more consistent and to  
 12146 use two-letter options where appropriate. We were running out of  
 12147 sensible letters. This may break some makefiles, so check the  
 12148 current options list by invoking the compiler with no parameters.

12150 Completed the design and implementation of the ASL namespace  
 12151 optimization option for the compiler. This option optimizes all  
 12152 references to named objects to the shortest possible path. The  
 12153 first attempt tries to utilize a single nameseg (4 characters) and  
 12154 the "search-to-root" algorithm used by the interpreter. If that  
 12155 cannot be used (because either the name is not in the search path  
 12156 or there is a conflict with another object with the same name),  
 12157 the pathname is optimized using the carat prefix (usually a  
 12158 shorter string than specifying the entire path from the root.)

12160 Implemented support to obtain the DSDT from the Windows registry  
 12161 (when the disassembly option is specified with no input file).  
 12162 Added this code as the implementation for AcpiOsTableOverride in  
 12163 the Windows OSL. Migrated the 16-bit code (used in the AcpiDump  
 12164 utility) to scan memory for the DSDT to the AcpiOsTableOverride  
 12165 function in the DOS OSL to make the disassembler truly OS

12166 independent.

12168 Implemented a new option to disassemble and compile in one step.  
 12169 When used without an input filename, this option will grab the  
 12170 DSDT from the local machine, disassemble it, and compile it in one  
 12171 step.

12173 Added a warning message for invalid escapes (a backslash followed  
 12174 by any character other than the allowable escapes). This catches  
 12175 the quoted string error "\\_SB\_" (which should be "\\\_SB\_").

12177 Also, there are numerous instances in the ACPI specification where  
 12178 this error occurs.

12180 Added a compiler option to disable all optimizations. This is  
 12181 basically the "compatibility mode" because by using this option,  
 12182 the AML code will come out exactly the same as other ASL  
 12183 compilers.

12185 Added error messages for incorrectly ordered dependent resource  
 12186 functions. This includes: missing EndDependentFn macro at end of  
 12187 dependent resource list, nested dependent function macros (both  
 12188 start and end), and missing StartDependentFn macro. These are  
 12189 common errors that should be caught at compile time.

12191 Implemented \_OSI support for the disassembler and compiler. \_OSI  
 12192 must be included in the namespace for proper disassembly (because  
 12193 the disassembler must know the number of arguments.)

12195 Added an "optimization" message type that is optional (off by  
 12196 default). This message is used for all optimizations - including  
 12197 constant folding, integer optimization, and namepath optimization.

12199 -----  
 12200 25 July 2002. Summary of changes for this release.

12203 1) ACPI CA Core Subsystem Version 20020725:

12205 The AML Disassembler has been enhanced to produce compilable ASL  
 12206 code and has been integrated into the iASL compiler (see below) as  
 12207 well as the single-step disassembly for the AML debugger and the  
 12208 disassembler for the AcpiDump utility. All ACPI 2.0A opcodes,  
 12209 resource templates and macros are fully supported. The  
 12210 disassembler has been tested on over 30 different AML files,  
 12211 producing identical AML when the resulting disassembled ASL file  
 12212 is recompiled with the same ASL compiler.

12214 Modified the Resource Manager to allow zero interrupts and zero  
 12215 dma channels during the GetCurrentResources call. This was  
 12216 causing problems on some platforms.

12218 Added the AcpiOsRedirectOutput interface to the OSL to simplify  
 12219 output redirection for the AcpiOsPrintf and AcpiOsVprintf  
 12220 interfaces.

12222 Code and Data Size: Current core subsystem library sizes are shown  
 12223 below. These are the code and data sizes for the acpica.lib  
 12224 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 12225 values do not include any ACPI driver or OSPM code. The debug  
 12226 version of the code includes the debug output trace mechanism and  
 12227 has a larger code and data size. Note that these values will vary  
 12228 depending on the efficiency of the compiler and the compiler  
 12229 options used during generation.

12231 Previous Release

12232 Non-Debug Version: 68.7K Code, 7.4K Data, 76.1K Total  
 12233 Debug Version: 142.9K Code, 58.7K Data, 201.6K Total  
 12234 Current Release:  
 12235 Non-Debug Version: 69.1K Code, 8.2K Data, 77.3K Total  
 12236 Debug Version: 149.4K Code, 61.6K Data, 211.0K Total

12239 2) Linux

12241 Fixed a panic in the EC driver (Dominik Brodowski)

12243 Implemented checksum of the R/XSDT itself during Linux table scan  
 12244 (Richard Schaal)

12247 3) iASL compiler

12249 The AML disassembler is integrated into the compiler. The "-d" option invokes the disassembler to completely disassemble an input AML file, producing as output a text ASL file with the extension ".dsl" (to avoid name collisions with existing .asl source files.) A future enhancement will allow the disassembler to obtain the BIOS DSDT from the registry under Windows.

12256 Fixed a problem with the VendorShort and VendorLong resource descriptors where an invalid AML sequence was created.

12259 Implemented a fix for BufferData term in the ASL parser. It was inadvertently defined twice, allowing invalid syntax to pass and causing reduction conflicts.

12263 Fixed a problem where the Ones opcode could get converted to a value of zero if "Ones" was used where a byte, word or dword value was expected. The 64-bit value is now truncated to the correct size with the correct value.

12270 -----

12271 02 July 2002. Summary of changes for this release.

12274 1) ACPI CA Core Subsystem Version 20020702:

12276 The Table Manager code has been restructured to add several new features. Tables that are not required by the core subsystem (other than the FADT, DSDT, FACS, PSDTs, etc.) are no longer validated in any way and are returned from AcpiGetFirmwareTable if requested. The AcpiOsTableOverride interface is now called for each table that is loaded by the subsystem in order to allow the host to override any table it chooses. Previously, only the DSDT could be overridden. Added one new files, tbrsdt.c and tbgetall.c.

12286 Fixed a problem with the conversion of internal package objects to external objects (when a package is returned from a control method.) The return buffer length was set to zero instead of the proper length of the package object.

12291 Fixed a reported problem with the use of the RefOf and DeRefOf operators when passing reference arguments to control methods. A new type of Reference object is used internally for references produced by the RefOf operator.

12296 Added additional error messages in the Resource Manager to explain AE\_BAD\_DATA errors when they occur during resource parsing.

12299 Split the AcpiEnableSubsystem into two primitives to enable a finer granularity initialization sequence. These two calls should be called in this order: AcpiEnableSubsystem (flags), AcpiInitializeObjects (flags). The flags parameter remains the same.

12306 2) Linux

12308 Updated the ACPI utilities module to understand the new style of fully resolved package objects that are now returned from the core subsystem. This eliminates errors of the form:

```
12312 ACPI: PCI Interrupt Routing Table [_SB_.PCI0.PPB._PRT]
12313 acpi_utils-0430 [145] acpi_evaluate_reference:
12314 Invalid element in package (not a device reference)
```

12316 The method evaluation utility uses the new buffer allocation scheme instead of calling AcpiEvaluate Object twice.

12319 Added support for ECDDT. This allows the use of the Embedded

12321 Controller before the namespace has been fully initialized, which is necessary for ACPI 2.0 support, and for some laptops to initialize properly. (Laptops using ECDDT are still rare, so only limited testing was performed of the added functionality.)

12326 Fixed memory leaks in the EC driver.

12328 Eliminated a brittle code structure in acpi\_bus\_init().

12330 Eliminated the acpi\_evaluate() helper function in utils.c. It is no longer needed since acpi\_evaluate\_object can optionally allocate memory for the return object.

12334 Implemented fix for keyboard hang when getting battery readings on some systems (Stephen White)

12337 PCI IRQ routing update (Dominik Brodowski)

12339 Fix an ifdef to allow compilation on UP with LAPIC but no IOAPIC support

12342 -----

12343 11 June 2002. Summary of changes for this release.

12346 1) ACPI CA Core Subsystem Version 20020611:

12348 Fixed a reported problem where constants such as Zero and One appearing within \_PRT packages were not handled correctly within the resource manager code. Originally reported against the ASL compiler because the code generator now optimizes integers to their minimal AML representation (i.e. AML constants if possible.) The \_PRT code now handles all AML constant opcodes correctly (Zero, One, Ones, Revision).

12356 Fixed a problem with the Concatenate operator in the AML interpreter where a buffer result object was incorrectly marked as not fully evaluated, causing a run-time error of AE\_AML\_INTERNAL.

12360 All package sub-objects are now fully resolved before they are returned from the external ACPI interfaces. This means that name strings are resolved to object handles, and constant operators (Zero, One, Ones, Revision) are resolved to Integers.

12365 Implemented immediate resolution of the AML Constant opcodes  
 12366 (Zero, One, Ones, Revision) to Integer objects upon detection  
 12367 within the AML stream. This has simplified and reduced the  
 12368 generated code size of the subsystem by eliminating about 10  
 12369 switch statements for these constants (which previously were  
 12370 contained in Reference objects.) The complicating issues are that  
 12371 the Zero opcode is used as a "placeholder" for unspecified  
 12372 optional target operands and stores to constants are defined to be  
 12373 no-ops.

12375 Code and Data Size: Current core subsystem library sizes are shown  
 12376 below. These are the code and data sizes for the acpica.lib  
 12377 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 12378 values do not include any ACPI driver or OSPM code. The debug  
 12379 version of the code includes the debug output trace mechanism and  
 12380 has a larger code and data size. Note that these values will vary  
 12381 depending on the efficiency of the compiler and the compiler  
 12382 options used during generation.

12384	Previous Release			
12385	Non-Debug Version:	69.3K Code,	7.4K Data,	76.7K Total
12386	Debug Version:	143.8K Code,	58.8K Data,	202.6K Total
12387	Current Release:			
12388	Non-Debug Version:	68.7K Code,	7.4K Data,	76.1K Total
12389	Debug Version:	142.9K Code,	58.7K Data,	201.6K Total

12392 2) Linux

12395 Added preliminary support for obtaining \_TRA data for PCI root  
 12396 bridges (Bjorn Helgaas).

12399 3) iASL Compiler Version X2046:

12401 Fixed a problem where the "\_DDN" reserved name was defined to be a  
 12402 control method with one argument. There are no arguments, and  
 12403 \_DDN does not have to be a control method.

12405 Fixed a problem with the Linux version of the compiler where the  
 12406 source lines printed with error messages were the wrong lines.  
 12407 This turned out to be the "LF versus CR/LF" difference between  
 12408 Windows and Unix. This appears to be the longstanding issue  
 12409 concerning listing output and error messages.

12411 Fixed a problem with the Linux version of compiler where opcode  
 12412 names within error messages were wrong. This was caused by a  
 12413 slight difference in the output of the Flex tool on Linux versus  
 12414 Windows.

12416 Fixed a problem with the Linux compiler where the hex output files  
 12417 contained some garbage data caused by an internal buffer overrun.

12420 -----  
 12421 17 May 2002. Summary of changes for this release.

12424 1) ACPI CA Core Subsystem Version 20020517:

12426 Implemented a workaround to an BIOS bug discovered on the HP  
 12427 OmniBook where the FADT revision number and the table size are  
 12428 inconsistent (ACPI 2.0 revision vs. ACPI 1.0 table size). The new  
 12429 behavior is to fallback to using only the ACPI 1.0 fields of the

12430 FADT if the table is too small to be a ACPI 2.0 table as claimed  
 12431 by the revision number. Although this is a BIOS bug, this is a  
 12432 case where the workaround is simple enough and with no side  
 12433 effects, so it seemed prudent to add it. A warning message is  
 12434 issued, however.

12436 Implemented minimum size checks for the fixed-length ACPI tables -  
 12437 - the FADT and FACS, as well as consistency checks between the  
 12438 revision number and the table size.

12440 Fixed a reported problem in the table override support where the  
 12441 new table pointer was incorrectly treated as a physical address  
 12442 instead of a logical address.

12444 Eliminated the use of the AE\_AML\_ERROR exception and replaced it  
 12445 with more descriptive codes.

12447 Fixed a problem where an exception would occur if an ASL Field was  
 12448 defined with no named Field Units underneath it (used by some  
 12449 index fields).

12451 Code and Data Size: Current core subsystem library sizes are shown  
 12452 below. These are the code and data sizes for the acpica.lib  
 12453 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 12454 values do not include any ACPI driver or OSPM code. The debug  
 12455 version of the code includes the debug output trace mechanism and  
 12456 has a larger code and data size. Note that these values will vary  
 12457 depending on the efficiency of the compiler and the compiler  
 12458 options used during generation.

12460	Previous Release			
12461	Non-Debug Version:	68.8K Code,	7.1K Data,	75.9K Total
12462	Debug Version:	142.9K Code,	58.4K Data,	201.3K Total
12463	Current Release:			
12464	Non-Debug Version:	69.3K Code,	7.4K Data,	76.7K Total
12465	Debug Version:	143.8K Code,	58.8K Data,	202.6K Total

12469 2) Linux

12471 Much work done on ACPI init (MADT and PCI IRQ routing support).  
 12472 (Paul D. and Dominik Brodowski)

12474 Fix PCI IRQ-related panic on boot (Sam Revitch)

12476 Set BM\_ARB\_DIS when entering a sleep state (Ducrot Bruno)

12478 Fix "MHz" typo (Dominik Brodowski)

12480 Fix RTC year 2000 issue (Dominik Brodowski)

12482 Preclude multiple button proc entries (Eric Brunet)

12484 Moved arch-specific code out of include/platform/aclinux.h

12486 3) iASL Compiler Version X2044:

12488 Implemented error checking for the string used in the EISAID macro  
 12489 (Usually used in the definition of the \_HID object.) The code now  
 12490 strictly enforces the PnP format - exactly 7 characters, 3  
 12491 uppercase letters and 4 hex digits.

12493 If a raw string is used in the definition of the \_HID object  
 12494 (instead of the EISAID macro), the string must contain all  
 12495 alphanumeric characters (e.g., "\*PNP0011" is not allowed because

12496 of the asterisk.)

12498 Implemented checking for invalid use of ACPI reserved names for  
12499 most of the name creation operators (Name, Device, Event, Mutex,  
12500 OperationRegion, PowerResource, Processor, and ThermalZone.)  
12501 Previously, this check was only performed for control methods.

12503 Implemented an additional check on the Name operator to emit an  
12504 error if a reserved name that must be implemented in ASL as a  
12505 control method is used. We know that a reserved name must be a  
12506 method if it is defined with input arguments.

12508 The warning emitted when a namespace object reference is not found  
12509 during the cross reference phase has been changed into an error.  
12510 The "External" directive should be used for names defined in other  
12511 modules.

#### 12514 4) Tools and Utilities

12516 The 16-bit tools (adump16 and aexec16) have been regenerated and  
12517 tested.

12519 Fixed a problem with the output of both acpidump and adump16 where  
12520 the indentation of closing parentheses and brackets was not

12522 aligned properly with the parent block.

12525 -----

12526 03 May 2002. Summary of changes for this release.

#### 12529 1) ACPI CA Core Subsystem Version 20020503:

12531 Added support a new OSL interface that allows the host operating

12533 system software to override the DSDT found in the firmware -  
12534 AcpiOsTableOverride. With this interface, the OSL can examine the  
12535 version of the firmware DSDT and replace it with a different one  
12536 if desired.

12538 Added new external interfaces for accessing ACPI registers from  
12539 device drivers and other system software - AcpiGetRegister and  
12540 AcpiSetRegister. This was simply an externalization of the  
12541 existing AcpiHwBitRegister interfaces.

12543 Fixed a regression introduced in the previous build where the  
12544 ASL/AML CreateField operator always returned an error,  
12545 "destination must be a NS Node".

12547 Extended the maximum time (before failure) to successfully enable  
12548 ACPI mode to 3 seconds.

12550 Code and Data Size: Current core subsystem library sizes are shown  
12551 below. These are the code and data sizes for the acpica.lib  
12552 produced by the Microsoft Visual C++ 6.0 compiler, and these  
12553 values do not include any ACPI driver or OSPM code. The debug  
12554 version of the code includes the debug output trace mechanism and  
12555 has a larger code and data size. Note that these values will vary  
12556 depending on the efficiency of the compiler and the compiler  
12557 options used during generation.

12559 Previous Release  
12560 Non-Debug Version: 68.5K Code, 7.0K Data, 75.5K Total  
12561 Debug Version: 142.4K Code, 58.3K Data, 200.7K Total

12562 Current Release:  
12563 Non-Debug Version: 68.8K Code, 7.1K Data, 75.9K Total  
12564 Debug Version: 142.9K Code, 58.4K Data, 201.3K Total

#### 12567 2) Linux

12569 Enhanced ACPI init code for SMP. We are now fully MPS and \$PIR-  
12570 free. While 3 out of 4 of our in-house systems work fine, the last  
12571 one still hangs when testing the LAPIC timer.

12573 Renamed many files in 2.5 kernel release to omit "acpi\_" from the  
12574 name.

12576 Added warning on boot for Presario 711FR.

12578 Sleep improvements (Pavel Machek)

12580 ACPI can now be built without CONFIG\_PCI enabled.

12582 IA64: Fixed memory map functions (JI Lee)

#### 12585 3) iASL Compiler Version X2043:

12587 Added support to allow the compiler to be integrated into the MS  
12588 VC++ development environment for one-button compilation of single  
12589 files or entire projects -- with error-to-source-line mapping.

12591 Implemented support for compile-time constant folding for the  
12592 Type3, Type4, and Type5 opcodes first defined in the ACPI 2.0  
12593 specification. This allows the ASL writer to use expressions  
12594 instead of Integer/Buffer/String constants in terms that must  
12595 evaluate to constants at compile time and will also simplify the  
12596 emitted AML in any such sub-expressions that can be folded  
12597 (evaluated at compile-time.) This increases the size of the  
12598 compiler significantly because a portion of the ACPI CA AML  
12599 interpreter is included within the compiler in order to pre-  
12600 evaluate constant expressions.

12603 Fixed a problem with the "Unicode" ASL macro that caused the  
12604 compiler to fault. (This macro is used in conjunction with the  
12605 \_STR reserved name.)

12607 Implemented an AML opcode optimization to use the Zero, One, and  
12608 Ones opcodes where possible to further reduce the size of integer  
12609 constants and thus reduce the overall size of the generated AML  
12610 code.

12612 Implemented error checking for new reserved terms for ACPI version  
12613 2.0A.

12615 Implemented the -qr option to display the current list of ACPI  
12616 reserved names known to the compiler.

12618 Implemented the -qc option to display the current list of ASL  
12619 operators that are allowed within constant expressions and can  
12620 therefore be folded at compile time if the operands are constants.

#### 12623 4) Documentation

12625 Updated the Programmer's Reference for new interfaces, data types,  
12626 and memory allocation model options.

12628 Updated the iASL Compiler User Reference to apply new format and  
12629 add information about new features and options.

12631 -----  
12632 19 April 2002. Summary of changes for this release.

12634 1) ACPI CA Core Subsystem Version 20020419:

12636 The source code base for the Core Subsystem has been completely  
12637 cleaned with PC-lint (FlexLint) for both 32-bit and 64-bit  
12638 versions. The Lint option files used are included in the  
12639 /acpi/generate/lint directory.

12641 Implemented enhanced status/error checking across the entire  
12642 Hardware manager subsystem. Any hardware errors (reported from  
12643 the OSL) are now bubbled up and will abort a running control  
12644 method.

12647 Fixed a problem where the per-ACPI-table integer width (32 or 64)  
12648 was stored only with control method nodes, causing a fault when  
12649 non-control method code was executed during table loading. The  
12650 solution implemented uses a global variable to indicate table  
12651 width across the entire ACPI subsystem. Therefore, ACPI CA does  
12652 not support mixed integer widths across different ACPI tables  
12653 (DSDT, SSDT).

12655 Fixed a problem where NULL extended fields (X fields) in an ACPI  
12656 2.0 ACPI FADT caused the table load to fail. Although the  
12657 existing ACPI specification is a bit fuzzy on this topic, the new  
12658 behavior is to fall back on a ACPI 1.0 field if the corresponding  
12659 ACPI 2.0 X field is zero (even though the table revision indicates  
12660 a full ACPI 2.0 table.) The ACPI specification will be updated to  
12661 clarify this issue.

12663 Fixed a problem with the SystemMemory operation region handler  
12664 where memory was always accessed byte-wise even if the AML-  
12665 specified access width was larger than a byte. This caused  
12666 problems on systems with memory-mapped I/O. Memory is now  
12667 accessed with the width specified. On systems that do not support  
12668 non-aligned transfers, a check is made to guarantee proper address  
12669 alignment before proceeding in order to avoid an AML-caused  
12670 alignment fault within the kernel.

12673 Fixed a problem with the ExtendedIrq resource where only one byte  
12674 of the 4-byte Irq field was extracted.

12676 Fixed the AcpiExDigitsNeeded() procedure to support \_UID. This  
12677 function was out of date and required a rewrite.

12679 Code and Data Size: Current core subsystem library sizes are shown  
12680 below. These are the code and data sizes for the acpica.lib  
12681 produced by the Microsoft Visual C++ 6.0 compiler, and these  
12682 values do not include any ACPI driver or OSPM code. The debug  
12683 version of the code includes the debug output trace mechanism and  
12684 has a larger code and data size. Note that these values will vary  
12685 depending on the efficiency of the compiler and the compiler  
12686 options used during generation.

12688	Previous Release			
12689	Non-Debug Version:	66.6K Code,	6.5K Data,	73.1K Total
12690	Debug Version:	139.8K Code,	57.4K Data,	197.2K Total
12691	Current Release:			
12692	Non-Debug Version:	68.5K Code,	7.0K Data,	75.5K Total
12693	Debug Version:	142.4K Code,	58.3K Data,	200.7K Total

12696 2) Linux

12698 PCI IRQ routing fixes (Dominik Brodowski)

12701 3) iASL Compiler Version X2042:

12703 Implemented an additional compile-time error check for a field  
12704 unit whose size + minimum access width would cause a run-time  
12705 access beyond the end-of-region. Previously, only the field size  
12706 itself was checked.

12708 The Core subsystem and iASL compiler now share a common parse  
12709 object in preparation for compile-time evaluation of the type  
12710 3/4/5 ASL operators.

12713 -----  
12714 Summary of changes for this release: 03\_29\_02

12716 1) ACPI CA Core Subsystem Version 20020329:

12718 Implemented support for late evaluation of TermArg operands to  
12719 Buffer and Package objects. This allows complex expressions to be  
12720 used in the declarations of these object types.

12722 Fixed an ACPI 1.0 compatibility issue when reading Fields. In ACPI  
12723 1.0, if the field was larger than 32 bits, it was returned as a  
12724 buffer - otherwise it was returned as an integer. In ACPI 2.0,  
12725 the field is returned as a buffer only if the field is larger than  
12726 64 bits. The TableRevision is now considered when making this  
12727 conversion to avoid incompatibility with existing ASL code.

12729 Implemented logical addressing for AcpiOsGetRootPointer. This  
12730 allows an RSDP with either a logical or physical address. With  
12731 this support, the host OS can now override all ACPI tables with  
12732 one logical RSDP. Includes implementation of "typed" pointer  
12733 support to allow a common data type for both physical and logical  
12734 pointers internally. This required a change to the  
12735 AcpiOsGetRootPointer interface.

12737 Implemented the use of ACPI 2.0 Generic Address Structures for all  
12738 GPE, Fixed Event, and PM Timer I/O. This allows the use of memory  
12739 mapped I/O for these ACPI features.

12741 Initialization now ignores not only non-required tables (All  
12742 tables other than the FADT, FACS, DSDT, and SSDTs), but also does  
12743 not validate the table headers of unrecognized tables.

12745 Fixed a problem where a notify handler could only be  
12746 installed/removed on an object of type Device. All "notify"

12748 objects are now supported -- Devices, Processor, Power, and  
12749 Thermal.

12751 Removed most verbosity from the ACPI\_DB\_INFO debug level. Only  
12752 critical information is returned when this debug level is enabled.

12754 Code and Data Size: Current core subsystem library sizes are shown  
12755 below. These are the code and data sizes for the acpica.lib  
12756 produced by the Microsoft Visual C++ 6.0 compiler, and these  
12757 values do not include any ACPI driver or OSPM code. The debug  
12758 version of the code includes the debug output trace mechanism and  
12759 has a larger code and data size. Note that these values will vary

12760 depending on the efficiency of the compiler and the compiler  
12761 options used during generation.

12763 Previous Release  
12764 Non-Debug Version: 65.4K Code, 6.2K Data, 71.6K Total  
12765 Debug Version: 138.0K Code, 56.6K Data, 194.6K Total  
12766 Current Release:  
12767 Non-Debug Version: 66.6K Code, 6.5K Data, 73.1K Total  
12768 Debug Version: 139.8K Code, 57.4K Data, 197.2K Total

12771 2) Linux:

12773 The processor driver (acpi\_processor.c) now fully supports ACPI  
12774 2.0-based processor performance control (e.g. Intel(R)  
12775 SpeedStep(TM) technology) Note that older laptops that only have  
12776 the Intel "applet" interface are not supported through this. The  
12777 'limit' and 'performance' interface (/proc) are fully functional.  
12778 [Note that basic policy for controlling performance state  
12779 transitions will be included in the next version of ospmd.] The  
12780 idle handler was modified to more aggressively use C2, and PIIX4  
12781 errata handling underwent a complete overhaul (big thanks to  
12782 Dominik Brodowski).

12784 Added support for ACPI-PCI device binding (acpi\_pci\_root.c). \_ADR-  
12785 based devices in the ACPI namespace are now dynamically bound  
12786 (associated) with their PCI counterparts (e.g. PCI1->01:00.0).  
12787 This allows, among other things, ACPI to resolve bus numbers for  
12788 subordinate PCI bridges.

12790 Enhanced PCI IRQ routing to get the proper bus number for \_PRT  
12791 entries defined underneath PCI bridges.

12793 Added IBM 600E to bad bios list due to invalid \_ADR value for  
12794 PIIX4 PCI-ISA bridge, resulting in improper PCI IRQ routing.

12796 In the process of adding full MADT support (e.g. IOAPIC) for IA32  
12797 (acpi.c, mpparse.c) -- stay tuned.

12799 Added back visual differentiation between fixed-feature and  
12800 control-method buttons in dmesg. Buttons are also subtyped (e.g.  
12801 button/power/PWRF) to simplify button identification.

12803 We no longer use -Wno-unused when compiling debug. Please ignore  
12804 any "\_THIS\_MODULE defined but not used" messages.

12806 Can now shut down the system using "magic sysrq" key.

12809 3) iASL Compiler version 2041:

12811 Fixed a problem where conversion errors for hex/octal/decimal  
12812 constants were not reported.

12814 Implemented a fix for the General Register template Address field.  
12815 This field was 8 bits when it should be 64.

12817 Fixed a problem where errors/warnings were no longer being emitted  
12818 within the listing output file.

12820 Implemented the ACPI 2.0A restriction on ACPI Table Signatures to  
12821 exactly 4 characters, alphanumeric only.

12826 -----  
12827 Summary of changes for this release: 03\_08\_02

12830 1) ACPI CA Core Subsystem Version 20020308:

12832 Fixed a problem with AML Fields where the use of the "AccessAny"  
12833 keyword could cause an interpreter error due to attempting to read  
12834 or write beyond the end of the parent Operation Region.

12836 Fixed a problem in the SystemMemory Operation Region handler where  
12837 an attempt was made to map memory beyond the end of the region.  
12838 This was the root cause of the "AE\_ERROR" and "AE\_NO\_MEMORY"  
12839 errors on some Linux systems.

12841 Fixed a problem where the interpreter/namespace "search to root"  
12842 algorithm was not functioning for some object types. Relaxed the  
12843 internal restriction on the search to allow upsearches for all  
12844 external object types as well as most internal types.

12847 2) Linux:

12849 We now use safe\_halt() macro versus individual calls to sti | hlt.

12851 Writing to the processor limit interface should now work. "echo 1"  
12852 will increase the limit, 2 will decrease, and 0 will reset to the

12854 default.

12857 3) ASL compiler:

12859 Fixed segfault on Linux version.

12862 -----  
12863 Summary of changes for this release: 02\_25\_02

12865 1) ACPI CA Core Subsystem:

12868 Fixed a problem where the GPE bit masks were not initialized  
12869 properly, causing erratic GPE behavior.

12871 Implemented limited support for multiple calling conventions. The  
12872 code can be generated with either the VPL (variable parameter  
12873 list, or "C") convention, or the FPL (fixed parameter list, or  
12874 "Pascal") convention. The core subsystem is about 3.4% smaller  
12875 when generated with FPL.

12878 2) Linux

12880 Re-add some /proc/acpi/event functionality that was lost during  
12881 the rewrite

12883 Resolved issue with /proc events for fixed-feature buttons showing  
12884 up as the system device.

12886 Fixed checks on C2/C3 latencies to be inclusive of maximum values.

12888 Replaced AE\_ERRORS in acpi\_osl.c with more specific error codes.

12890 Changed ACPI PRT option from "pci=noacpi-routing" to "pci=noacpi"

12892 Fixed limit interface & usage to fix bugs with passive cooling  
12893 hysteresis.

12895 Restructured PRT support.

12898 -----  
12899 Summary of changes for this label: 02\_14\_02

12902 1) ACPI CA Core Subsystem:

12904 Implemented support in AcpiLoadTable to allow loading of FACS and  
12905 FADT tables.

12907 Support for the now-obsolete interim 0.71 64-bit ACPI tables has  
12908 been removed. All 64-bit platforms should be migrated to the ACPI  
12909 2.0 tables. The actbl71.h header has been removed from the source  
12910 tree.

12912 All C macros defined within the subsystem have been prefixed with  
12913 "ACPI\_" to avoid collision with other system include files.

12915 Removed the return value for the two AcpiOsPrint interfaces, since  
12916 it is never used and causes lint warnings for ignoring the return  
12917 value.

12919 Added error checking to all internal mutex acquire and release  
12920 calls. Although a failure from one of these interfaces is  
12921 probably a fatal system error, these checks will cause the  
12922 immediate abort of the currently executing method or interface.

12924 Fixed a problem where the AcpiSetCurrentResources interface could  
12925 fault. This was a side effect of the deployment of the new memory  
12926 allocation model.

12928 Fixed a couple of problems with the Global Lock support introduced  
12929 in the last major build. The "common" (1.0/2.0) internal FACS was  
12930 being overwritten with the FACS signature and clobbering the  
12931 Global Lock pointer. Also, the actual firmware FACS was being  
12932 unmapped after construction of the "common" FACS, preventing  
12933 access to the actual Global Lock field within it. The "common"  
12934 internal FACS is no longer installed as an actual ACPI table; it  
12935 is used simply as a global.

12937 Code and Data Size: Current core subsystem library sizes are shown  
12938 below. These are the code and data sizes for the acpica.lib  
12939 produced by the Microsoft Visual C++ 6.0 compiler, and these  
12940 values do not include any ACPI driver or OSPM code. The debug  
12941 version of the code includes the debug output trace mechanism and  
12942 has a larger code and data size. Note that these values will vary  
12943 depending on the efficiency of the compiler and the compiler  
12944 options used during generation.

12946	Previous Release (02_07_01)			
12947	Non-Debug Version:	65.2K Code,	6.2K Data,	71.4K Total
12948	Debug Version:	136.9K Code,	56.4K Data,	193.3K Total
12949	Current Release:			
12950	Non-Debug Version:	65.4K Code,	6.2K Data,	71.6K Total
12951	Debug Version:	138.0K Code,	56.6K Data,	194.6K Total

12954 2) Linux

12956 Updated Linux-specific code for core macro and OSL interface  
12957 changes described above.

12959 Improved /proc/acpi/event. It now can be opened only once and has  
12960 proper poll functionality.

12962 Fixed and restructured power management (acpi\_bus).

12964 Only create /proc "view by type" when devices of that class exist.

12966 Fixed "charging/discharging" bug (and others) in acpi\_battery.

12968 Improved thermal zone code.

12971 3) ASL Compiler, version X2039:

12974 Implemented the new compiler restriction on ASL String hex/octal  
12975 escapes to non-null, ASCII values. An error results if an invalid  
12976 value is used. (This will require an ACPI 2.0 specification  
12977 change.)

12979 AML object labels that are output to the optional C and ASM source  
12980 are now prefixed with both the ACPI table signature and table ID  
12981 to help guarantee uniqueness within a large BIOS project.

12984 -----  
12985 Summary of changes for this label: 02\_01\_02

12987 1) ACPI CA Core Subsystem:

12989 ACPI 2.0 support is complete in the entire Core Subsystem and the  
12990 ASL compiler. All new ACPI 2.0 operators are implemented and all  
12991 other changes for ACPI 2.0 support are complete. With  
12992 simultaneous code and data optimizations throughout the subsystem,  
12993 ACPI 2.0 support has been implemented with almost no additional  
12994 cost in terms of code and data size.

12996 Implemented a new mechanism for allocation of return buffers. If  
12997 the buffer length is set to ACPI\_ALLOCATE\_BUFFER, the buffer will  
12998 be allocated on behalf of the caller. Consolidated all return  
12999 buffer validation and allocation to a common procedure. Return  
13000 buffers will be allocated via the primary OSL allocation interface  
13001 since it appears that a separate pool is not needed by most users.  
13002 If a separate pool is required for these buffers, the caller can  
13003 still use the original mechanism and pre-allocate the buffer(s).

13005 Implemented support for string operands within the DereferOf  
13006 operator.

13008 Restructured the Hardware and Event managers to be table driven,  
13009 simplifying the source code and reducing the amount of generated  
13010 code.

13012 Split the common read/write low-level ACPI register bitfield  
13013 procedure into a separate read and write, simplifying the code  
13014 considerably.

13016 Obsolete the AcpiOsCallocate OSL interface. This interface was  
13017 used only a handful of times and didn't have enough critical mass  
13018 for a separate interface. Replaced with a common calloc procedure  
13019 in the core.

13021 Fixed a reported problem with the GPE number mapping mechanism  
13022 that allows GPE1 numbers to be non-contiguous with GPE0.  
13023 Reorganized the GPE information and shrunk a large array that was

13024 originally large enough to hold info for all possible GPEs (256)  
 13025 to simply large enough to hold all GPEs up to the largest GPE  
 13026 number on the machine.

13028 Fixed a reported problem with resource structure alignment on 64-  
 13029 bit platforms.

13031 Changed the AcpiEnableEvent and AcpiDisableEvent external  
 13032 interfaces to not require any flags for the common case of  
 13033 enabling/disabling a GPE.

13035 Implemented support to allow a "Notify" on a Processor object.

13037 Most TBDs in comments within the source code have been resolved  
 13038 and eliminated.

13041 Fixed a problem in the interpreter where a standalone parent  
 13042 prefix (^) was not handled correctly in the interpreter and  
 13043 debugger.

13045 Removed obsolete and unnecessary GPE save/restore code.

13047 Implemented Field support in the ASL Load operator. This allows a  
 13048 table to be loaded from a named field, in addition to loading a  
 13049 table directly from an Operation Region.

13051 Implemented timeout and handle support in the external Global Lock  
 13052 interfaces.

13054 Fixed a problem in the AcpiDump utility where pathnames were no  
 13055 longer being generated correctly during the dump of named objects.

13057 Modified the AML debugger to give a full display of if/while  
 13058 predicates instead of just one AML opcode at a time. (The  
 13059 predicate can have several nested ASL statements.) The old method  
 13060 was confusing during single stepping.

13062 Code and Data Size: Current core subsystem library sizes are shown  
 13063 below. These are the code and data sizes for the acpica.lib  
 13064 produced by the Microsoft Visual C++ 6.0 compiler, and these  
 13065 values do not include any ACPI driver or OSPM code. The debug  
 13066 version of the code includes the debug output trace mechanism and  
 13067 has a larger code and data size. Note that these values will vary  
 13068 depending on the efficiency of the compiler and the compiler  
 13069 options used during generation.

13071	Previous Release (12_18_01)			
13072	Non-Debug Version:	66.1K Code,	5.5K Data,	71.6K Total
13073	Debug Version:	138.3K Code,	55.9K Data,	194.2K Total
13074	Current Release:			
13075	Non-Debug Version:	65.2K Code,	6.2K Data,	71.4K Total
13076	Debug Version:	136.9K Code,	56.4K Data,	193.3K Total

13078 2) Linux

13080 Implemented fix for PIIX reverse throttling errata (Processor  
 13081 driver)

13083 Added new Limit interface (Processor and Thermal drivers)

13085 New thermal policy (Thermal driver)

13087 Many updates to /proc

13089 Battery "low" event support (Battery driver)

13091 Supports ACPI PCI IRQ routing (PCI Link and PCI root drivers)

13093 IA32 - IA64 initialization unification, no longer experimental

13095 Menuconfig options redesigned

13097 3) ASL Compiler, version X2037:

13099 Implemented several new output features to simplify integration of  
 13100 AML code into firmware: 1) Output the AML in C source code with  
 13101 labels for each named ASL object. The original ASL source code  
 13102 is interleaved as C comments. 2) Output the AML in ASM source code  
 13103 with labels and interleaved ASL source. 3) Output the AML in  
 13104 raw hex table form, in either C or ASM.

13106 Implemented support for optional string parameters to the  
 13107 LoadTable operator.

13109 Completed support for embedded escape sequences within string  
 13110 literals. The compiler now supports all single character escapes  
 13111 as well as the Octal and Hex escapes. Note: the insertion of a  
 13112 null byte into a string literal (via the hex/octal escape) causes  
 13113 the string to be immediately terminated. A warning is issued.

13115 Fixed a problem where incorrect AML was generated for the case  
 13116 where an ASL namepath consists of a single parent prefix (  
 13118 ) with no trailing name segments.

13120 The compiler has been successfully generated with a 64-bit C  
 13121 compiler.

13126 -----  
 13127 Summary of changes for this label: 12\_18\_01

13129 1) Linux

13131 Enhanced blacklist with reason and severity fields. Any table's  
 13132 signature may now be used to identify a blacklisted system.

13134 Call \_PIC control method to inform the firmware which interrupt  
 13135 model the OS is using. Turn on any disabled link devices.

13137 Cleaned up busmgr /proc error handling (Andreas Dilger)

13139 2) ACPI CA Core Subsystem:

13141 Implemented ACPI 2.0 semantics for the "Break" operator (Exit from  
 13142 while loop)

13144 Completed implementation of the ACPI 2.0 "Continue",  
 13145 "ConcatenateResTemplate", "DataTableRegion", and "LoadTable"  
 13146 operators. All new ACPI 2.0 operators are now implemented in both  
 13147 the ASL compiler and the AML interpreter. The only remaining ACPI  
 13148 2.0 task is support for the String data type in the Derefof  
 13149 operator. Fixed a problem with AcquireMutex where the status code  
 13150 was lost if the caller had to actually wait for the mutex.

13152 Increased the maximum ASL Field size from 64K bits to 4G bits.

13154 Completed implementation of the external Global Lock interfaces --  
 13155 AcpiAcquireGlobalLock and AcpiReleaseGlobalLock. The Timeout and

13156 Handler parameters were added.

13158 Completed another pass at removing warnings and issues when  
13159 compiling with 64-bit compilers. The code now compiles cleanly  
13160 with the Intel 64-bit C/C++ compiler. Most notably, the pointer  
13161 add and subtract (diff) macros have changed considerably.

13164 Created and deployed a new ACPI\_SIZE type that is 64-bits wide on  
13165 64-bit platforms, 32-bits on all others. This type is used  
13166 wherever memory allocation and/or the C sizeof() operator is used,  
13167 and affects the OSL memory allocation interfaces AcpiOsAllocate  
13168 and AcpiOsCAllocate.

13170 Implemented sticky user breakpoints in the AML debugger.

13172 Code and Data Size: Current core subsystem library sizes are shown  
13173 below. These are the code and data sizes for the acpica.lib  
13174 produced by the Microsoft Visual C++ 6.0 compiler, and these  
13175 values do not include any ACPI driver or OSPM code. The debug  
13176 version of the code includes the debug output trace mechanism and  
13177 has a larger code and data size. Note that these values will vary  
13178 depending on the efficiency of the compiler and the compiler  
13179 options used during generation.

13181	Previous Release (12_05_01)			
13182	Non-Debug Version:	64.7K Code,	5.3K Data,	70.0K Total
13183	Debug Version:	136.2K Code,	55.6K Data,	191.8K Total
13184	Current Release:			
13185	Non-Debug Version:	66.1K Code,	5.5K Data,	71.6K Total
13186	Debug Version:	138.3K Code,	55.9K Data,	194.2K Total

13188 3) ASL Compiler, version X2034:

13190 Now checks for (and generates an error if detected) the use of a  
13191 Break or Continue statement without an enclosing While statement.

13194 Successfully generated the compiler with the Intel 64-bit C  
13195 compiler.

13197 -----  
13198 Summary of changes for this label: 12\_05\_01

13200 1) ACPI CA Core Subsystem:

13202 The ACPI 2.0 CopyObject operator is fully implemented. This  
13203 operator creates a new copy of an object (and is also used to  
13204 bypass the "implicit conversion" mechanism of the Store operator.)

13206 The ACPI 2.0 semantics for the SizeOf operator are fully  
13207 implemented. The change is that performing a SizeOf on a  
13208 reference object causes an automatic dereference of the object to  
13209 the actual value before the size is evaluated. This behavior was  
13210 undefined in ACPI 1.0.

13212 The ACPI 2.0 semantics for the Extended IRQ resource descriptor  
13213 have been implemented. The interrupt polarity and mode are now  
13214 independently set.

13216 Fixed a problem where ASL Constants (Zero, One, Ones, Revision)  
13217 appearing in Package objects were not properly converted to  
13218 integers when the internal Package was converted to an external  
13219 object (via the AcpiEvaluateObject interface.)

13221 Fixed a problem with the namespace object deletion mechanism for

13222 objects created by control methods. There were two parts to this  
13223 problem: 1) Objects created during the initialization phase method  
13224 parse were not being deleted, and 2) The object owner ID mechanism  
13225 to track objects was broken.

13227 Fixed a problem where the use of the ASL Scope operator within a  
13228 control method would result in an invalid opcode exception.

13230 Fixed a problem introduced in the previous label where the buffer  
13231 length required for the \_PRT structure was not being returned  
13232 correctly.

13234 Code and Data Size: Current core subsystem library sizes are shown  
13235 below. These are the code and data sizes for the acpica.lib  
13236 produced by the Microsoft Visual C++ 6.0 compiler, and these  
13237 values do not include any ACPI driver or OSPM code. The debug  
13238 version of the code includes the debug output trace mechanism and  
13239 has a larger code and data size. Note that these values will vary  
13240 depending on the efficiency of the compiler and the compiler  
13241 options used during generation.

13243	Previous Release (11_20_01)			
13244	Non-Debug Version:	64.1K Code,	5.3K Data,	69.4K Total
13245	Debug Version:	135.1K Code,	55.4K Data,	190.5K Total

13247	Current Release:			
13248	Non-Debug Version:	64.7K Code,	5.3K Data,	70.0K Total
13249	Debug Version:	136.2K Code,	55.6K Data,	191.8K Total

13251 2) Linux:

13253 Updated all files to apply cleanly against 2.4.16.

13255 Added basic PCI Interrupt Routing Table (PRT) support for IA32  
13256 (acpi\_pci.c), and unified the PRT code for IA32 and IA64. This  
13257 version supports both static and dynamic PRT entries, but dynamic  
13258 entries are treated as if they were static (not yet  
13259 reconfigurable). Architecture- specific code to use this data is  
13260 absent on IA32 but should be available shortly.

13262 Changed the initialization sequence to start the ACPI interpreter  
13263 (acpi\_init) prior to initialization of the PCI driver (pci\_init)  
13264 in init/main.c. This ordering is required to support PRT and  
13265 facilitate other (future) enhancement. A side effect is that the  
13266 ACPI bus driver and certain device drivers can no longer be loaded  
13267 as modules.

13269 Modified the 'make menuconfig' options to allow PCI Interrupt  
13270 Routing support to be included without the ACPI Bus and other  
13271 device drivers.

13273 3) ASL Compiler, version X2033:

13275 Fixed some issues with the use of the new CopyObject and  
13276 DataTableRegion operators. Both are fully functional.

13278 -----  
13279 Summary of changes for this label: 11\_20\_01

13281 20 November 2001. Summary of changes for this release.

13283 1) ACPI CA Core Subsystem:

13285 Updated Index support to match ACPI 2.0 semantics. Storing a  
13286 Integer, String, or Buffer to an Index of a Buffer will store only  
13287 the least-significant byte of the source to the Indexed buffer

13288 byte. Multiple writes are not performed.

13290 Fixed a problem where the access type used in an AccessAs ASL  
13291 operator was not recorded correctly into the field object.

13293 Fixed a problem where ASL Event objects were created in a  
13294 signalled state. Events are now created in an unsignalled state.

13296 The internal object cache is now purged after table loading and  
13297 initialization to reduce the use of dynamic kernel memory -- on  
13298 the assumption that object use is greatest during the parse phase  
13299 of the entire table (versus the run-time use of individual control  
13300 methods.)

13302 ACPI 2.0 variable-length packages are now fully operational.

13304 Code and Data Size: Code and Data optimizations have permitted new  
13305 feature development with an actual reduction in the library size.  
13306 Current core subsystem library sizes are shown below. These are  
13307 the code and data sizes for the acpica.lib produced by the  
13308 Microsoft Visual C++ 6.0 compiler, and these values do not include  
13309 any ACPI driver or OSPM code. The debug version of the code  
13310 includes the debug output trace mechanism and has a larger code  
13311 and data size. Note that these values will vary depending on the  
13312 efficiency of the compiler and the compiler options used during  
13313 generation.

13315	Previous Release (11_09_01):			
13316	Non-Debug Version:	63.7K Code,	5.2K Data,	68.9K Total
13317	Debug Version:	134.5K Code,	55.4K Data,	189.9K Total

13319	Current Release:			
13320	Non-Debug Version:	64.1K Code,	5.3K Data,	69.4K Total
13321	Debug Version:	135.1K Code,	55.4K Data,	190.5K Total

13323 2) Linux:

13325 Enhanced the ACPI boot-time initialization code to allow the use  
13326 of Local APIC tables for processor enumeration on IA-32, and to  
13327 pave the way for a fully MPS-free boot (on SMP systems) in the  
13328 near future. This functionality replaces  
13329 arch/i386/kernel/acpitables.c, which was introduced in an earlier  
13330 2.4.15-preX release. To enable this feature you must add  
13331 "acpi\_boot=on" to the kernel command line -- see the help entry  
13332 for CONFIG\_ACPI\_BOOT for more information. An IA-64 release is in  
13333 the works...

13335 Restructured the configuration options to allow boot-time table  
13336 parsing support without inclusion of the ACPI Interpreter (and  
13337 other) code.

13339 NOTE: This release does not include fixes for the reported events,  
13340 power-down, and thermal passive cooling issues (coming soon).

13342 3) ASL Compiler:

13344 Added additional typechecking for Fields within restricted access  
13345 Operation Regions. All fields within EC and CMOS regions must be  
13346 declared with ByteAcc. All fields withing SMBus regions must be  
13347 declared with the BufferAcc access type.

13349 Fixed a problem where the listing file output of control methods  
13350 no longer interleaved the actual AML code with the ASL source  
13351 code.

13356 -----  
13357 Summary of changes for this label: 11\_09\_01

13359 1) ACPI CA Core Subsystem:

13361 Implemented ACPI 2.0-defined support for writes to fields with a  
13362 Buffer, String, or Integer source operand that is smaller than the  
13363 target field. In these cases, the source operand is zero-extended  
13364 to fill the target field.

13366 Fixed a problem where a Field starting bit offset (within the  
13367 parent operation region) was calculated incorrectly if the

13369 alignment of the field differed from the access width. This  
13370 affected CreateWordField, CreateDwordField, CreateQwordField, and  
13371 possibly other fields that use the "AccessAny" keyword.

13373 Fixed a problem introduced in the 11\_02\_01 release where indirect  
13374 stores through method arguments did not operate correctly.

13376 2) Linux:

13378 Implemented boot-time ACPI table parsing support  
13379 (CONFIG\_ACPI\_BOOT) for IA32 and IA64 UP/SMP systems. This code  
13380 facilitates the use of ACPI tables (e.g. MADT, SRAT) rather than  
13381 legacy BIOS interfaces (e.g. MPS) for the configuration of system  
13382 processors, memory, and interrupts during setup\_arch(). Note that  
13383 this patch does not include the required architecture-specific  
13384 changes required to apply this information -- subsequent patches  
13385 will be posted for both IA32 and IA64 to achieve this.

13387 Added low-level sleep support for IA32 platforms, courtesy of Pat  
13388 Mochel. This allows IA32 systems to transition to/from various  
13389 sleeping states (e.g. S1, S3), although the lack of a centralized  
13390 driver model and power-manageable drivers will prevent its  
13391 (successful) use on most systems.

13393 Revamped the ACPI 'menuconfig' layout: created new "ACPI Support"  
13394 submenu, unified IA32 and IA64 options, added new "Boot using ACPI  
13395 tables" option, etc.

13397 Increased the default timeout for the EC driver from 1ms to 10ms  
13398 (1000 cycles of 10us) to try to address AE\_TIME errors during EC  
13399 transactions.

13401 -----  
13402 Summary of changes for this label: 11\_02\_01

13404 1) ACPI CA Core Subsystem:

13406 ACPI 2.0 Support: Implemented ACPI 2.0 64-bit Field access  
13407 (QWordAcc keyword). All ACPI 2.0 64-bit support is now  
13408 implemented.

13410 OSL Interfaces: Several of the OSL (AcpiOs\*) interfaces required  
13411 changes to support ACPI 2.0 Qword field access. Read/Write  
13412 PciConfiguration(), Read/Write Memory(), and Read/Write Port() now  
13413 accept an ACPI\_INTEGER (64 bits) as the value parameter. Also,  
13414 the value parameter for the address space handler interface is now  
13415 an ACPI\_INTEGER. OSL implementations of these interfaces must now  
13416 handle the case where the Width parameter is 64.

13418 Index Fields: Fixed a problem where unaligned bit assembly and  
13419 disassembly for IndexFields was not supported correctly.

13421 Index and Bank Fields: Nested Index and Bank Fields are now  
 13422 supported. During field access, a check is performed to ensure  
 13423 that the value written to an Index or Bank register is not out of  
 13424 the range of the register. The Index (or Bank) register is  
 13425 written before each access to the field data. Future support will  
 13426 include allowing individual IndexFields to be wider than the  
 13427 DataRegister width.

13429 Fields: Fixed a problem where the AML interpreter was incorrectly  
 13430 attempting to write beyond the end of a Field/OpRegion. This was  
 13431 a boundary case that occurred when a DWORD field was written to a  
 13432 BYTE access OpRegion, forcing multiple writes and causing the  
 13433 interpreter to write one datum too many.

13435 Fields: Fixed a problem with Field/OpRegion access where the  
 13436 starting bit address of a field was incorrectly calculated if the  
 13437 current access type was wider than a byte (WordAcc, DwordAcc, or  
 13438 QwordAcc).

13440 Fields: Fixed a problem where forward references to individual  
 13441 FieldUnits (individual Field names within a Field definition) were  
 13442 not resolved during the AML table load.

13444 Fields: Fixed a problem where forward references from a Field  
 13445 definition to the parent Operation Region definition were not  
 13446 resolved during the AML table load.

13448 Fields: Duplicate FieldUnit names within a scope are now detected  
 13449 during AML table load.

13451 Acpi Interfaces: Fixed a problem where the AcpiGetName() interface  
 13452 returned an incorrect name for the root node.

13454 Code and Data Size: Code and Data optimizations have permitted new  
 13455 feature development with an actual reduction in the library size.  
 13456 Current core subsystem library sizes are shown below. These are  
 13457 the code and data sizes for the acpica.lib produced by the  
 13458 Microsoft Visual C++ 6.0 compiler, and these values do not include  
 13459 any ACPI driver or OSPM code. The debug version of the code  
 13460 includes the debug output trace mechanism and has a larger code  
 13461 and data size. Note that these values will vary depending on the  
 13462 efficiency of the compiler and the compiler options used during  
 13463 generation.

13465	Previous Release (10_18_01):			
13466	Non-Debug Version:	63.9K Code,	5.1K Data,	69.0K Total
13467	Debug Version:	136.7K Code,	57.4K Data,	194.2K Total

13469	Current Release:			
13470	Non-Debug Version:	63.7K Code,	5.2K Data,	68.9K Total
13471	Debug Version:	134.5K Code,	55.4K Data,	189.9K Total

13473 2) Linux:

13475 Improved /proc processor output (Pavel Machek) Re-added  
 13476 MODULE\_LICENSE("GPL") to all modules.

13478 3) ASL Compiler version X2030:

13480 Duplicate FieldUnit names within a scope are now detected and  
 13481 flagged as errors.

13483 4) Documentation:

13485 Programmer Reference updated to reflect OSL and address space

13486 handler interface changes described above.

13488 -----  
 13489 Summary of changes for this label: 10\_18\_01

13491 ACPI CA Core Subsystem:

13493 Fixed a problem with the internal object reference count mechanism  
 13494 that occasionally caused premature object deletion. This resolves  
 13495 all of the outstanding problem reports where an object is deleted  
 13496 in the middle of an interpreter evaluation. Although this problem  
 13497 only showed up in rather obscure cases, the solution to the  
 13498 problem involved an adjustment of all reference counts involving  
 13499 objects attached to namespace nodes.

13501 Fixed a problem with Field support in the interpreter where  
 13502 writing to an aligned field whose length is an exact multiple (2  
 13503 or greater) of the field access granularity would cause an attempt  
 13504 to write beyond the end of the field.

13506 The top level AML opcode execution functions within the  
 13507 interpreter have been renamed with a more meaningful and  
 13508 consistent naming convention. The modules exmonad.c and  
 13509 exdyadic.c were eliminated. New modules are exoparg1.c,  
 13510 exoparg2.c, exoparg3.c, and exoparg6.c.

13512 Support for the ACPI 2.0 "Mid" ASL operator has been implemented.

13514 Fixed a problem where the AML debugger was causing some internal  
 13515 objects to not be deleted during subsystem termination.

13517 Fixed a problem with the external AcpiEvaluateObject interface  
 13518 where the subsystem would fault if the named object to be  
 13519 evaluated referred to a constant such as Zero, Ones, etc.

13521 Fixed a problem with IndexFields and BankFields where the  
 13522 subsystem would fault if the index, data, or bank registers were  
 13523 not defined in the same scope as the field itself.

13525 Added printf format string checking for compilers that support  
 13526 this feature. Corrected more than 50 instances of issues with  
 13527 format specifiers within invocations of ACPI\_DEBUG\_PRINT  
 13528 throughout the core subsystem code.

13530 The ASL "Revision" operator now returns the ACPI support level  
 13531 implemented in the core - the value "2" since the ACPI 2.0 support  
 13532 is more than 50% implemented.

13534 Enhanced the output of the AML debugger "dump namespace" command  
 13535 to output in a more human-readable form.

13537 Current core subsystem library code sizes are shown below. These

13539 are the code and data sizes for the acpica.lib produced by the  
 13540 Microsoft Visual C++ 6.0 compiler, and these values do not include  
 13541 any ACPI driver or OSPM code. The debug version of the code  
 13542 includes the full debug trace mechanism -- leading to a much

13544 larger code and data size. Note that these values will vary  
 13545 depending on the efficiency of the compiler and the compiler  
 13546 options used during generation.

13548	Previous Label (09_20_01):			
13549	Non-Debug Version:	65K Code,	5K Data,	70K Total
13550	Debug Version:	138K Code,	58K Data,	196K Total

13552        This Label:

13554        Non-Debug Version:   63.9K Code,    5.1K Data,    69.0K Total  
 13555        Debug Version:       136.7K Code,   57.4K Data,   194.2K Total

13557 Linux:

13559 Implemented a "Bad BIOS Blacklist" to track machines that have  
 13560 known ASL/AML problems.

13562 Enhanced the /proc interface for the thermal zone driver and added  
 13563 support for \_HOT (the critical suspend trip point). The 'info'  
 13564 file now includes threshold/policy information, and allows setting  
 13565 of \_SCP (cooling preference) and \_TZP (polling frequency) values  
 13566 to the 'info' file. Examples: "echo tzp=5 > info" sets the polling  
 13567 frequency to 5 seconds, and "echo scp=1 > info" sets the cooling  
 13568 preference to the passive/quiet mode (if supported by the ASL).

13570 Implemented a workaround for a gcc bug that resuted in an OOPs  
 13571 when loading the control method battery driver.

13573 -----  
 13574 Summary of changes for this label: 09\_20\_01

13576 ACPI CA Core Subsystem:

13578 The AcpiEnableEvent and AcpiDisableEvent interfaces have been  
 13579 modified to allow individual GPE levels to be flagged as wake-  
 13580 enabled (i.e., these GPEs are to remain enabled when the platform  
 13581 sleeps.)

13583 The AcpiEnterSleepState and AcpiLeaveSleepState interfaces now  
 13584 support wake-enabled GPEs. This means that upon entering the  
 13585 sleep state, all GPEs that are not wake-enabled are disabled.  
 13586 When leaving the sleep state, these GPEs are reenabled.

13588 A local double-precision divide/modulo module has been added to  
 13589 enhance portability to OS kernels where a 64-bit math library is  
 13590 not available. The new module is "utmath.c".

13592 Several optimizations have been made to reduce the use of CPU  
 13593 stack. Originally over 2K, the maximum stack usage is now below  
 13594 2K at 1860 bytes (1.82k)

13596 Fixed a problem with the AcpiGetFirmwareTable interface where the  
 13597 root table pointer was not mapped into a logical address properly.

13599 Fixed a problem where a NULL pointer was being dereferenced in the  
 13600 interpreter code for the ASL Notify operator.

13602 Fixed a problem where the use of the ASL Revision operator  
 13603 returned an error. This operator now returns the current version  
 13604 of the ACPI CA core subsystem.

13606 Fixed a problem where objects passed as control method parameters  
 13607 to AcpiEvaluateObject were always deleted at method termination.  
 13608 However, these objects may end up being stored into the namespace  
 13609 by the called method. The object reference count mechanism was  
 13610 applied to these objects instead of a force delete.

13612 Fixed a problem where static strings or buffers (contained in the  
 13613 AML code) that are declared as package elements within the ASL  
 13614 code could cause a fault because the interpreter would attempt to  
 13615 delete them. These objects are now marked with the "static  
 13616 object" flag to prevent any attempt to delete them.

13618 Implemented an interpreter optimization to use operands directly  
 13619 from the state object instead of extracting the operands to local  
 13620 variables. This reduces stack use and code size, and improves  
 13621 performance.

13623 The module exxface.c was eliminated as it was an unnecessary extra  
 13624 layer of code.

13626 Current core subsystem library code sizes are shown below. These  
 13627 are the code and data sizes for the acpica.lib produced by the  
 13628 Microsoft Visual C++ 6.0 compiler, and these values do not include  
 13629 any ACPI driver or OSPM code. The debug version of the code  
 13630 includes the full debug trace mechanism -- leading to a much  
 13631 larger code and data size. Note that these values will vary  
 13632 depending on the efficiency of the compiler and the compiler  
 13633 options used during generation.

13635        Non-Debug Version:   65K Code,    5K Data,    70K Total  
 13636        (Previously 69K)    Debug Version:   138K Code, 58K Data, 196K  
 13637        Total        (Previously 195K)

13639 Linux:

13641 Support for ACPI 2.0 64-bit integers has been added.    All ACPI  
 13642 Integer objects are now 64 bits wide

13644 All Acpi data types and structures are now in lower case.   Only  
 13645 Acpi macros are upper case for differentiation.

13647 Documentation:

13649 Changes to the external interfaces as described above.

13651 -----  
 13652 Summary of changes for this label: 08\_31\_01

13654 ACPI CA Core Subsystem:

13656 A bug with interpreter implementation of the ASL Divide operator  
 13657 was found and fixed. The implicit function return value (not the  
 13658 explicit store operands) was returning the remainder instead of  
 13659 the quotient. This was a longstanding bug and it fixes several  
 13660 known outstanding issues on various platforms.

13662 The ACPI\_DEBUG\_PRINT and function trace entry/exit macros have  
 13663 been further optimized for size. There are 700 invocations of the  
 13664 DEBUG\_PRINT macro alone, so each optimization reduces the size of  
 13665 the debug version of the subsystem significantly.

13667 A stack trace mechanism has been implemented. The maximum stack  
 13668 usage is about 2K on 32-bit platforms. The debugger command "stat  
 13669 stack" will display the current maximum stack usage.

13671 All public symbols and global variables within the subsystem are  
 13672 now prefixed with the string "Acpi". This keeps all of the  
 13673 symbols grouped together in a kernel map, and avoids conflicts  
 13674 with other kernel subsystems.

13676 Most of the internal fixed lookup tables have been moved into the  
 13677 code segment via the const operator.

13679 Several enhancements have been made to the interpreter to both  
 13680 reduce the code size and improve performance.

13682 Current core subsystem library code sizes are shown below. These  
 13683 are the code and data sizes for the acpica.lib produced by the

13684 Microsoft Visual C++ 6.0 compiler, and these values do not include  
 13685 any ACPI driver or OSPM code. The debug version of the code  
 13686 includes the full debug trace mechanism which contains over 700  
 13687 invocations of the DEBUG\_PRINT macro, 500 function entry macro  
 13688 invocations, and over 900 function exit macro invocations --  
 13689 leading to a much larger code and data size. Note that these  
 13690 values will vary depending on the efficiency of the compiler and  
 13691 the compiler options used during generation.

13693 Non-Debug Version: 64K Code, 5K Data, 69K Total  
 13694 Debug Version: 137K Code, 58K Data, 195K Total

13696 Linux:

13698 Implemented wbinvd() macro, pending a kernel-wide definition.

13700 Fixed /proc/acpi/event to handle poll() and short reads.

13702 ASL Compiler, version X2026:

13704 Fixed a problem introduced in the previous label where the AML

13706 code emitted for package objects produced packages with zero  
 13707 length.

13709 -----  
 13710 Summary of changes for this label: 08\_16\_01

13712 ACPI CA Core Subsystem:

13714 The following ACPI 2.0 ASL operators have been implemented in the  
 13715 AML interpreter (These are already supported by the Intel ASL  
 13716 compiler): ToDecimalString, ToHexString, ToString, ToInteger, and  
 13717 ToBuffer. Support for 64-bit AML constants is implemented in the  
 13718 AML parser, debugger, and disassembler.

13720 The internal memory tracking mechanism (leak detection code) has  
 13721 been upgraded to reduce the memory overhead (a separate tracking  
 13722 block is no longer allocated for each memory allocation), and now  
 13723 supports all of the internal object caches.

13725 The data structures and code for the internal object caches have  
 13726 been coalesced and optimized so that there is a single cache and  
 13727 memory list data structure and a single group of functions that  
 13728 implement generic cache management. This has reduced the code  
 13729 size in both the debug and release versions of the subsystem.

13731 The DEBUG\_PRINT macro(s) have been optimized for size and replaced  
 13732 by ACPI\_DEBUG\_PRINT. The syntax for this macro is slightly  
 13733 different, because it generates a single call to an internal  
 13734 function. This results in a savings of about 90 bytes per  
 13735 invocation, resulting in an overall code and data savings of about  
 13736 16% in the debug version of the subsystem.

13738 Linux:

13740 Fixed C3 disk corruption problems and re-enabled C3 on supporting  
 13741 machines.

13743 Integrated low-level sleep code by Patrick Mochel.

13745 Further tweaked source code Linuxization.

13747 Other minor fixes.

13749 ASL Compiler:

13751 Support for ACPI 2.0 variable length packages is fixed/completed.

13753 Fixed a problem where the optional length parameter for the ACPI  
 13754 2.0 ToString operator.

13756 Fixed multiple extraneous error messages when a syntax error is  
 13757 detected within the declaration line of a control method.

13759 -----  
 13760 Summary of changes for this label: 07\_17\_01

13762 ACPI CA Core Subsystem:

13764 Added a new interface named AcpiGetFirmwareTable to obtain any  
 13765 ACPI table via the ACPI signature. The interface can be called at  
 13766 any time during kernel initialization, even before the kernel  
 13767 virtual memory manager is initialized and paging is enabled. This  
 13768 allows kernel subsystems to obtain ACPI tables very early, even  
 13769 before the ACPI CA subsystem is initialized.

13771 Fixed a problem where Fields defined with the AnyAcc attribute  
 13772 could be resolved to the incorrect address under the following  
 13773 conditions: 1) the field width is larger than 8 bits and 2) the  
 13774 parent operation region is not defined on a DWORD boundary.

13776 Fixed a problem where the interpreter is not being locked during  
 13777 namespace initialization (during execution of the \_INI control  
 13778 methods), causing an error when an attempt is made to release it  
 13779 later.

13781 ACPI 2.0 support in the AML Interpreter has begun and will be  
 13782 ongoing throughout the rest of this year. In this label, The Mod  
 13783 operator is implemented.

13785 Added a new data type to contain full PCI addresses named  
 13786 ACPI\_PCI\_ID. This structure contains the PCI Segment, Bus, Device,  
 13787 and Function values.

13789 Linux:

13791 Enhanced the Linux version of the source code to change most  
 13792 capitalized ACPI type names to lowercase. For example, all  
 13793 instances of ACPI\_STATUS are changed to acpi\_status. This will  
 13794 result in a large diff, but the change is strictly cosmetic and  
 13795 aligns the CA code closer to the Linux coding standard.

13797 OSL Interfaces:

13799 The interfaces to the PCI configuration space have been changed to  
 13800 add the PCI Segment number and to split the single 32-bit combined  
 13801 DeviceFunction field into two 16-bit fields. This was  
 13802 accomplished by moving the four values that define an address in  
 13803 PCI configuration space (segment, bus, device, and function) to  
 13804 the new ACPI\_PCI\_ID structure.

13806 The changes to the PCI configuration space interfaces led to a  
 13807 reexamination of the complete set of address space access  
 13808 interfaces for PCI, I/O, and Memory. The previously existing 18  
 13809 interfaces have proven difficult to maintain (any small change  
 13810 must be propagated across at least 6 interfaces) and do not easily  
 13811 allow for future expansion to 64 bits if necessary. Also, on some  
 13812 systems, it would not be appropriate to demultiplex the access  
 13813 width (8, 16, 32, or 64) before calling the OSL if the  
 13814 corresponding native OS interfaces contain a similar access width  
 13815 parameter. For these reasons, the 18 address space interfaces

13816 have been replaced by these 6 new ones:

```
13818 AcpiOsReadPciConfiguration
13819 AcpiOsWritePciConfiguration
13820 AcpiOsReadMemory
13821 AcpiOsWriteMemory
13822 AcpiOsReadPort
13823 AcpiOsWritePort
```

13825 Added a new interface named AcpiOsGetRootPointer to allow the OSL  
13826 to perform the platform and/or OS-specific actions necessary to  
13827 obtain the ACPI RSDP table pointer. On IA-32 platforms, this  
13828 interface will simply call down to the CA core to perform the low-  
13829 memory search for the table. On IA-64, the RSDP is obtained from  
13830 EFI. Migrating this interface to the OSL allows the CA core to

13832 remain OS and platform independent.

13834 Added a new interface named AcpiOsSignal to provide a generic  
13835 "function code and pointer" interface for various miscellaneous  
13836 signals and notifications that must be made to the host OS. The  
13837 first such signals are intended to support the ASL Fatal and  
13838 Breakpoint operators. In the latter case, the AcpiOsBreakpoint  
13839 interface has been obsoleted.

13841 The definition of the AcpiFormatException interface has been  
13842 changed to simplify its use. The caller no longer must supply a  
13843 buffer to the call; A pointer to a const string is now returned  
13844 directly. This allows the call to be easily used in printf  
13845 statements, etc. since the caller does not have to manage a local  
13846 buffer.

13849 ASL Compiler, Version X2025:

13851 The ACPI 2.0 Switch/Case/Default operators have been implemented  
13852 and are fully functional. They will work with all ACPI 1.0  
13853 interpreters, since the operators are simply translated to If/Else  
13854 pairs.

13856 The ACPI 2.0 ElseIf operator is implemented and will also work  
13857 with 1.0 interpreters, for the same reason.

13859 Implemented support for ACPI 2.0 variable-length packages. These  
13860 packages have a separate opcode, and their size is determined by  
13861 the interpreter at run-time.

13863 Documentation The ACPI CA Programmer Reference has been updated to  
13864 reflect the new interfaces and changes to existing interfaces.

13866 -----  
13867 Summary of changes for this label: 06\_15\_01

13869 ACPI CA Core Subsystem:

13871 Fixed a problem where a DWORD-accessed field within a Buffer  
13872 object would get its byte address inadvertently rounded down to  
13873 the nearest DWORD. Buffers are always Byte-accessible.

13875 ASL Compiler, version X2024:

13877 Fixed a problem where the Switch() operator would either fault or  
13878 hang the compiler. Note however, that the AML code for this ACPI  
13879 2.0 operator is not yet implemented.

13881 Compiler uses the new AcpiOsGetTimer interface to obtain compile

13882 timings.

13884 Implementation of the CreateField operator automatically converts  
13885 a reference to a named field within a resource descriptor from a  
13886 byte offset to a bit offset if required.

13888 Added some missing named fields from the resource descriptor  
13889 support. These are the names that are automatically created by the  
13890 compiler to reference fields within a descriptor. They are only  
13891 valid at compile time and are not passed through to the AML  
13892 interpreter.

13894 Resource descriptor named fields are now typed as Integers and  
13895 subject to compile-time typechecking when used in expressions.

13897 -----  
13898 Summary of changes for this label: 05\_18\_01

13900 ACPI CA Core Subsystem:

13902 Fixed a couple of problems in the Field support code where bits  
13903 from adjacent fields could be returned along with the proper field  
13904 bits. Restructured the field support code to improve performance,  
13905 readability and maintainability.

13907 New DEBUG\_PRINTP macro automatically inserts the procedure name  
13908 into the output, saving hundreds of copies of procedure name  
13909 strings within the source, shrinking the memory footprint of the  
13910 debug version of the core subsystem.

13912 Source Code Structure:

13914 The source code directory tree was restructured to reflect the  
13915 current organization of the component architecture. Some files  
13916 and directories have been moved and/or renamed.

13918 Linux:

13920 Fixed leaking kacpidpc processes.

13922 Fixed queueing event data even when /proc/acpi/event is not  
13923 opened.

13925 ASL Compiler, version X2020:

13927 Memory allocation performance enhancement - over 24X compile time  
13928 improvement on large ASL files. Parse nodes and namestring  
13929 buffers are now allocated from a large internal compiler buffer.

13931 The temporary .SRC file is deleted unless the "-s" option is  
13932 specified

13934 The "-d" debug output option now sends all output to the .DBG file  
13935 instead of the console.

13937 "External" second parameter is now optional

13939 "ElseIf" syntax now properly allows the predicate

13941 Last operand to "Load" now recognized as a Target operand

13943 Debug object can now be used anywhere as a normal object.

13945 ResourceTemplate now returns an object of type BUFFER

13947 EISAID now returns an object of type INTEGER

13949 "Index" now works with a STRING operand

13951 "LoadTable" now accepts optional parameters

13953 "ToString" length parameter is now optional

13955 "Interrupt (ResourceType," parse error fixed.

13957 "Register" with a user-defined region space parse error fixed

13959 Escaped backslash at the end of a string ("\\") scan/parse error  
13960 fixed

13962 "Revision" is now an object of type INTEGER.

13966 -----  
13967 Summary of changes for this label: 05\_02\_01

13969 Linux:

13971 /proc/acpi/event now blocks properly.

13973 Removed /proc/sys/acpi. You can still dump your DSDT from  
13974 /proc/acpi/dsdt.

13976 ACPI CA Core Subsystem:

13978 Fixed a problem introduced in the previous label where some of the  
13979 "small" resource descriptor types were not recognized.

13981 Improved error messages for the case where an ASL Field is outside  
13982 the range of the parent operation region.

13984 ASL Compiler, version X2018:

13987 Added error detection for ASL Fields that extend beyond the length  
13988 of the parent operation region (only if the length of the region  
13989 is known at compile time.) This includes fields that have a  
13990 minimum access width that is smaller than the parent region, and  
13991 individual field units that are partially or entirely beyond the  
13992 extent of the parent.

13996 -----  
13997 Summary of changes for this label: 04\_27\_01

13999 ACPI CA Core Subsystem:

14001 Fixed a problem where the namespace mutex could be released at the  
14002 wrong time during execution of AcpiRemoveAddressSpaceHandler.

14004 Added optional thread ID output for debug traces, to simplify  
14005 debugging of multiple threads. Added context switch notification  
14006 when the debug code realizes that a different thread is now  
14007 executing ACPI code.

14009 Some additional external data types have been prefixed with the  
14010 string "ACPI\_" for consistency. This may effect existing code.  
14011 The data types affected are the external callback typedefs - e.g.,

14013 WALK\_CALLBACK becomes ACPI\_WALK\_CALLBACK.

14015 Linux:

14017 Fixed an issue with the OSL semaphore implementation where a  
14018 thread was waking up with an error from receiving a SIGCHLD  
14019 signal.

14021 Linux version of ACPI CA now uses the system C library for string  
14022 manipulation routines instead of a local implementation.

14024 Cleaned up comments and removed TBDs.

14026 ASL Compiler, version X2017:

14028 Enhanced error detection and reporting for all file I/O  
14029 operations.

14031 Documentation:

14033 Programmer Reference updated to version 1.06.

14037 -----  
14038 Summary of changes for this label: 04\_13\_01

14040 ACPI CA Core Subsystem:

14042 Restructured support for BufferFields and RegionFields.  
14043 BankFields support is now fully operational. All known 32-bit  
14044 limitations on field sizes have been removed. Both BufferFields  
14045 and (Operation) RegionFields are now supported by the same field  
14046 management code.

14048 Resource support now supports QWORD address and IO resources. The  
14049 16/32/64 bit address structures and the Extended IRQ structure  
14050 have been changed to properly handle Source Resource strings.

14052 A ThreadId of -1 is now used to indicate a "mutex not acquired"  
14053 condition internally and must never be returned by AcpiOsThreadId.  
14054 This reserved value was changed from 0 since Unix systems allow a  
14055 thread ID of 0.

14057 Linux:

14059 Driver code reorganized to enhance portability

14061 Added a kernel configuration option to control ACPI\_DEBUG

14063 Fixed the EC driver to honor \_GLK.

14065 ASL Compiler, version X2016:

14067 Fixed support for the "FixedHw" keyword. Previously, the FixedHw  
14068 address space was set to 0, not 0x7f as it should be.

14070 -----  
14071 Summary of changes for this label: 03\_13\_01

14073 ACPI CA Core Subsystem:

14075 During ACPI initialization, the \_SB\_.INI method is now run if  
14076 present.

14078 Notify handler fix - notifies are deferred until the parent method  
14079 completes execution. This fixes the "mutex already acquired"

14080 issue seen occasionally.

14082 Part of the "implicit conversion" rules in ACPI 2.0 have been  
14083 found to cause compatibility problems with existing ASL/AML. The  
14084 convert "result-to-target-type" implementation has been removed  
14085 for stores to method Args and Locals. Source operand conversion  
14086 is still fully implemented. Possible changes to ACPI 2.0  
14087 specification pending.

14089 Fix to AcpiRsCalculatePciRoutingTableLength to return correct  
14090 length.

14092 Fix for compiler warnings for 64-bit compiles.

14094 Linux:

14096 /proc output aligned for easier parsing.

14098 Release-version compile problem fixed.

14100 New kernel configuration options documented in Configure.help.

14102 IBM 600E - Fixed Sleep button may generate "Invalid <NULL>  
14103 context" message.

14105 OSPM:

14107 Power resource driver integrated with bus manager.

14109 Fixed kernel fault during active cooling for thermal zones.

14111 Source Code:

14113 The source code tree has been restructured.

14117 -----  
14118 Summary of changes for this label: 03\_02\_01

14120 Linux OS Services Layer (OSL):

14122 Major revision of all Linux-specific code.

14124 Modularized all ACPI-specific drivers.

14126 Added new thermal zone and power resource drivers.

14128 Revamped /proc interface (new functionality is under /proc/acpi).

14130 New kernel configuration options.

14132 Linux known issues:

14134 New kernel configuration options not documented in Configure.help  
14135 yet.

14138 Module dependencies not currently implemented. If used, they  
14139 should be loaded in this order: busmgr, power, ec, system,  
14140 processor, battery, ac\_adapter, button, thermal.

14142 Modules will not load if CONFIG\_MODVERSION is set.

14144 IBM 600E - entering S5 may reboot instead of shutting down.

14146 IBM 600E - Sleep button may generate "Invalid <NULL> context"  
14147 message.

14149 Some systems may fail with "execution mutex already acquired"  
14150 message.

14152 ACPI CA Core Subsystem:

14154 Added a new OSL Interface, AcpiOsGetThreadId. This was required  
14155 for the deadlock detection code. Defined to return a non-zero, 32-  
14156 bit thread ID for the currently executing thread. May be a non-  
14157 zero constant integer on single-thread systems.

14159 Implemented deadlock detection for internal subsystem mutexes. We  
14160 may add conditional compilation for this code (debug only) later.

14162 ASL/AML Mutex object semantics are now fully supported. This  
14163 includes multiple acquires/releases by owner and support for the

14165 Mutex SyncLevel parameter.

14167 A new "Force Release" mechanism automatically frees all ASL  
14168 Mutexes that have been acquired but not released when a thread  
14169 exits the interpreter. This forces conformance to the ACPI spec  
14170 ("All mutexes must be released when an invocation exits") and  
14171 prevents deadlocked ASL threads. This mechanism can be expanded  
14172 (later) to monitor other resource acquisitions if OEM ASL code  
14173 continues to misbehave (which it will).

14175 Several new ACPI exception codes have been added for the Mutex  
14176 support.

14178 Recursive method calls are now allowed and supported (the ACPI  
14179 spec does in fact allow recursive method calls.) The number of  
14180 recursive calls is subject to the restrictions imposed by the  
14181 SERIALIZED method keyword and SyncLevel (ACPI 2.0) method  
14182 parameter.

14184 Implemented support for the SyncLevel parameter for control  
14185 methods (ACPI 2.0 feature)

14187 Fixed a deadlock problem when multiple threads attempted to use  
14188 the interpreter.

14190 Fixed a problem where the string length of a String package  
14191 element was not always set in a package returned from  
14192 AcpiEvaluateObject.

14194 Fixed a problem where the length of a String package element was  
14195 not always included in the length of the overall package returned  
14196 from AcpiEvaluateObject.

14198 Added external interfaces (Acpi\*) to the ACPI debug memory  
14199 manager. This manager keeps a list of all outstanding  
14200 allocations, and can therefore detect memory leaks and attempts to  
14201 free memory blocks more than once. Useful for code such as the  
14202 power manager, etc. May not be appropriate for device drivers.  
14203 Performance with the debug code enabled is slow.

14205 The ACPI Global Lock is now an optional hardware element.

14207 ASL Compiler Version X2015:

14209 Integrated changes to allow the compiler to be generated on  
14210 multiple platforms.

14212 Linux makefile added to generate the compiler on Linux

14214 Source Code:

14216 All platform-specific headers have been moved to their own  
14217 subdirectory, Include/Platform.

14219 New source file added, Interpreter/ammutex.c

14221 New header file, Include/acstruct.h

14223 Documentation:

14225 The programmer reference has been updated for the following new  
14226 interfaces: AcpiOsGetThreadId AcpiAllocate AcpiCAllocate AcpiFree

14228 -----  
14229 Summary of changes for this label: 02\_08\_01

14231 Core ACPI CA Subsystem: Fixed a problem where an error was  
14232 incorrectly returned if the return resource buffer was larger than  
14233 the actual data (in the resource interfaces).

14235 References to named objects within packages are resolved to the  
14237 full pathname string before packages are returned directly (via  
14238 the AcpiEvaluateObject interface) or indirectly via the resource  
14239 interfaces.

14241 Linux OS Services Layer (OSL):

14243 Improved /proc battery interface.

14246 Added C-state debugging output and other miscellaneous fixes.

14248 ASL Compiler Version X2014:

14250 All defined method arguments can now be used as local variables,  
14251 including the ones that are not actually passed in as parameters.  
14252 The compiler tracks initialization of the arguments and issues an  
14253 exception if they are used without prior assignment (just like  
14254 locals).

14256 The -o option now specifies a filename prefix that is used for all  
14257 output files, including the AML output file. Otherwise, the  
14258 default behavior is as follows: 1) the AML goes to the file  
14259 specified in the DSDT. 2) all other output files use the input  
14260 source filename as the base.

14262 -----  
14263 Summary of changes for this label: 01\_25\_01

14265 Core ACPI CA Subsystem: Restructured the implementation of object  
14266 store support within the interpreter. This includes support for  
14267 the Store operator as well as any ASL operators that include a  
14268 target operand.

14270 Partially implemented support for Implicit Result-to-Target  
14271 conversion. This is when a result object is converted on the fly  
14272 to the type of an existing target object. Completion of this  
14273 support is pending further analysis of the ACPI specification  
14274 concerning this matter.

14276 CPU-specific code has been removed from the subsystem (hardware  
14277 directory).

14279 New Power Management Timer functions added

14281 Linux OS Services Layer (OSL): Moved system state transition code  
14282 to the core, fixed it, and modified Linux OSL accordingly.

14284 Fixed C2 and C3 latency calculations.

14287 We no longer use the compilation date for the version message on  
14288 initialization, but retrieve the version from AcpiGetSystemInfo().

14290 Incorporated for fix Sony VAIO machines.

14292 Documentation: The Programmer Reference has been updated and  
14293 reformatted.

14296 ASL Compiler: Version X2013: Fixed a problem where the line  
14297 numbering and error reporting could get out of sync in the  
14298 presence of multiple include files.

14300 -----  
14301 Summary of changes for this label: 01\_15\_01

14303 Core ACPI CA Subsystem:

14305 Implemented support for type conversions in the execution of the  
14306 ASL Concatenate operator (The second operand is converted to  
14307 match the type of the first operand before concatenation.)

14309 Support for implicit source operand conversion is partially  
14310 implemented. The ASL source operand types Integer, Buffer, and  
14311 String are freely interchangeable for most ASL operators and are  
14312 converted by the interpreter on the fly as required. Implicit  
14313 Target operand conversion (where the result is converted to the  
14314 target type before storing) is not yet implemented.

14316 Support for 32-bit and 64-bit BCD integers is implemented.

14318 Problem fixed where a field read on an aligned field could cause a  
14319 read past the end of the field.

14321 New exception, AE\_AML\_NO\_RETURN\_VALUE, is returned when a method  
14322 does not return a value, but the caller expects one. (The ASL  
14323 compiler flags this as a warning.)

14325 ASL Compiler:

14327 Version X2011:

14328 1. Static typechecking of all operands is implemented. This  
14329 prevents the use of invalid objects (such as using a Package where  
14330 an Integer is required) at compile time instead of at interpreter  
14331 run-time.

14332 2. The ASL source line is printed with ALL errors and warnings.

14333 3. Bug fix for source EOF without final linefeed.

14334 4. Debug option is split into a parse trace and a namespace trace.

14335 5. Namespace output option (-n) includes initial values for  
14336 integers and strings.

14337 6. Parse-only option added for quick syntax checking.

14338 7. Compiler checks for duplicate ACPI name declarations

14340 Version X2012:

14341 1. Relaxed typechecking to allow interchangeability between  
14342 strings, integers, and buffers. These types are now converted by  
14343 the interpreter at runtime.

14344 2. Compiler reports time taken by each internal subsystem in the  
14345 debug output file.

14348 -----  
14349 Summary of changes for this label: 12\_14\_00

14351 ASL Compiler:

14353 This is the first official release of the compiler. Since the  
14354 compiler requires elements of the Core Subsystem, this label  
14355 synchronizes everything.

14357 -----  
14358 Summary of changes for this label: 12\_08\_00

14361 Fixed a problem where named references within the ASL definition  
14362 of both OperationRegions and CreateXXXFields did not work  
14363 properly. The symptom was an AE\_AML\_OPERAND\_TYPE during  
14364 initialization of the region/field. This is similar (but not  
14365 related internally) to the problem that was fixed in the last  
14366 label.

14368 Implemented both 32-bit and 64-bit support for the BCD ASL  
14369 functions ToBCD and FromBCD.

14371 Updated all legal headers to include "2000" in the copyright  
14372 years.

14374 -----  
14375 Summary of changes for this label: 12\_01\_00

14377 Fixed a problem where method invocations within the ASL definition  
14378 of both OperationRegions and CreateXXXFields did not work  
14379 properly. The symptom was an AE\_AML\_OPERAND\_TYPE during  
14380 initialization of the region/field:

14382 nsinit-0209: AE\_AML\_OPERAND\_TYPE while getting region arguments  
14383 [DEBG] ammonad-0284: Exec\_monadic2\_r/Not: bad operand(s)  
14384 (0x3005)

14386 Fixed a problem where operators with more than one nested  
14387 subexpression would fail. The symptoms were varied, by mostly  
14388 AE\_AML\_OPERAND\_TYPE errors. This was actually a rather serious  
14389 problem that has gone unnoticed until now.

14391 Subtract (Add (1,2), Multiply (3,4))

14393 Fixed a problem where AcpiGetHandle didn't quite get fixed in the  
14394 previous build (The prefix part of a relative path was handled  
14395 incorrectly).

14397 Fixed a problem where Operation Region initialization failed if  
14398 the operation region name was a "namepath" instead of a simple  
14399 "nameseg". Symptom was an AE\_NO\_OPERAND error.

14401 Fixed a problem where an assignment to a local variable via the  
14402 indirect RefOf mechanism only worked for the first such  
14403 assignment. Subsequent assignments were ignored.

14405 -----  
14406 Summary of changes for this label: 11\_15\_00

14408 ACPI 2.0 table support with backwards support for ACPI 1.0 and the  
14409 0.71 extensions. Note: although we can read ACPI 2.0 BIOS tables,

14410 the AML interpreter does NOT have support for the new 2.0 ASL  
14411 grammar terms at this time.

14413 All ACPI hardware access is via the GAS structures in the ACPI 2.0  
14414 FADT.

14416 All physical memory addresses across all platforms are now 64 bits  
14417 wide. Logical address width remains dependent on the platform  
14418 (i.e., "void \*").

14420 AcpiOsMapMemory interface changed to a 64-bit physical address.

14422 The AML interpreter integer size is now 64 bits, as per the ACPI  
14423 2.0 specification.

14425 For backwards compatibility with ACPI 1.0, ACPI tables with a  
14426 revision number less than 2 use 32-bit integers only.

14428 Fixed a problem where the evaluation of OpRegion operands did not  
14429 always resolve them to numbers properly.

14431 -----  
14432 Summary of changes for this label: 10\_20\_00

14434 Fix for CBN\_.\_STA issue. This fix will allow correct access to  
14435 CBN\_ OpRegions when the \_STA returns 0x8.

14437 Support to convert ACPI constants (Ones, Zeros, One) to actual  
14438 values before a package object is returned

14440 Fix for method call as predicate to if/while construct causing  
14441 incorrect if/while behavior

14443 Fix for Else block package lengths sometimes calculated wrong (if  
14444 block > 63 bytes)

14446 Fix for Processor object length field, was always zero

14448 Table load abort if FACP sanity check fails

14450 Fix for problem with Scope(name) if name already exists

14452 Warning emitted if a named object referenced cannot be found  
14453 (resolved) during method execution.

14459 -----  
14460 Summary of changes for this label: 9\_29\_00

14462 New table initialization interfaces: AcpiInitializeSubsystem no  
14463 longer has any parameters AcpiFindRootPointer - Find the RSDP (if  
14464 necessary) AcpiLoadTables (RSDP) - load all tables found at RSDP-  
14465 >RSDT Obsolete Interfaces AcpiLoadFirmwareTables - replaced by  
14466 AcpiLoadTables

14468 Note: These interface changes require changes to all existing OSDs

14470 The PCI\_Config default address space handler is always installed  
14471 at the root namespace object.

14473 -----  
14474 Summary of changes for this label: 09\_15\_00

14476 The new initialization architecture is implemented. New  
 14477 interfaces are: AcpiInitializeSubsystem (replaces AcpiInitialize)  
 14478 AcpiEnableSubsystem Obsolete Interfaces: AcpiLoadNamespace

14480 (Namespace is automatically loaded when a table is loaded)

14482 The ACPI\_OPERAND\_OBJECT has been optimized to shrink its size from  
 14483 52 bytes to 32 bytes. There is usually one of these for every  
 14484 namespace object, so the memory savings is significant.

14486 Implemented just-in-time evaluation of the CreateField operators.

14488 Bug fixes for IA-64 support have been integrated.

14490 Additional code review comments have been implemented

14492 The so-called "third pass parse" has been replaced by a final walk  
 14493 through the namespace to initialize all operation regions (address  
 14494 spaces) and fields that have not yet been initialized during the  
 14495 execution of the various \_INI and REG methods.

14497 New file - namespace/nsinit.c

14499 -----  
 14500 Summary of changes for this label: 09\_01\_00

14502 Namespace manager data structures have been reworked to change the  
 14503 primary object from a table to a single object. This has  
 14504 resulted in dynamic memory savings of 3X within the namespace and  
 14505 2X overall in the ACPI CA subsystem.

14507 Fixed problem where the call to AcpiEvFindPciRootBuses was  
 14508 inadvertently left commented out.

14510 Reduced the warning count when generating the source with the GCC  
 14511 compiler.

14513 Revision numbers added to each module header showing the  
 14514 SourceSafe version of the file. Please refer to this version  
 14515 number when giving us feedback or comments on individual modules.

14517 The main object types within the subsystem have been renamed to  
 14518 clarify their purpose:

14520 ACPI\_INTERNAL\_OBJECT -> ACPI\_OPERAND\_OBJECT  
 14521 ACPI\_GENERIC\_OP -> ACPI\_PARSE\_OBJECT  
 14522 ACPI\_NAME\_TABLE\_ENTRY -> ACPI\_NAMESPACE\_NODE

14524 NOTE: no changes to the initialization sequence are included in  
 14525 this label.

14527 -----  
 14528 Summary of changes for this label: 08\_23\_00

14530 Fixed problem where TerminateControlMethod was being called  
 14531 multiple times per method

14533 Fixed debugger problem where single stepping caused a semaphore to  
 14534 be oversignalled

14536 Improved performance through additional parse object caching -  
 14537 added ACPI\_EXTENDED\_OP type

14539 -----  
 14540 Summary of changes for this label: 08\_10\_00

14542 Parser/Interpreter integration: Eliminated the creation of  
 14543 complete parse trees for ACPI tables and control methods.  
 14544 Instead, parse subtrees are created and then deleted as soon as  
 14545 they are processed (Either entered into the namespace or executed  
 14546 by the interpreter). This reduces the use of dynamic kernel  
 14547 memory significantly. (about 10X)

14549 Exception codes broken into classes and renumbered. Be sure to  
 14550 recompile all code that includes acexcep.h. Hopefully we won't  
 14551 have to renumber the codes again now that they are split into  
 14552 classes (environment, programmer, AML code, ACPI table, and  
 14553 internal).

14555 Fixed some additional alignment issues in the Resource Manager  
 14556 subcomponent

14558 Implemented semaphore tracking in the AcpiExec utility, and fixed  
 14559 several places where mutexes/semaphores were being unlocked  
 14560 without a corresponding lock operation. There are no known  
 14561 semaphore or mutex "leaks" at this time.

14563 Fixed the case where an ASL Return operator is used to return an  
 14564 unnamed package.

14566 -----  
 14567 Summary of changes for this label: 07\_28\_00

14569 Fixed a problem with the way addresses were calculated in  
 14570 AcpiAmlReadFieldData() and AcpiAmlWriteFieldData(). This problem  
 14571 manifested itself when a Field was created with WordAccess or  
 14572 DwordAccess, but the field unit defined within the Field was less  
 14574 than a Word or Dword.

14576 Fixed a problem in AmlDumpOperands() module's loop to pull  
 14577 operands off of the operand stack to display information. The  
 14578 problem manifested itself as a TLB error on 64-bit systems when  
 14579 accessing an operand stack with two or more operands.

14581 Fixed a problem with the PCI configuration space handlers where  
 14582 context was getting confused between accesses. This required a  
 14583 change to the generic address space handler and address space  
 14584 setup definitions. Handlers now get both a global handler context  
 14585 (this is the one passed in by the user when executing  
 14586 AcpiInstallAddressSpaceHandler()) and a specific region context  
 14587 that is unique to each region (For example, the \_ADR, \_SEG and  
 14588 \_BBN values associated with a specific region). The generic  
 14589 function definitions have changed to the following:

14591 typedef ACPI\_STATUS (\*ADDRESS\_SPACE\_HANDLER) ( UINT32 Function,  
 14592 UINT32 Address, UINT32 BitWidth, UINT32 \*Value, void  
 14593 \*HandlerContext, // This used to be void \*Context void  
 14594 \*RegionContext); // This is an additional parameter

14596 typedef ACPI\_STATUS (\*ADDRESS\_SPACE\_SETUP) ( ACPI\_HANDLE  
 14597 RegionHandle, UINT32 Function, void \*HandlerContext, void  
 14598 \*\*RegionContext); // This used to be \*\*ReturnContext

14600 -----  
 14601 Summary of changes for this label: 07\_21\_00

14603 Major file consolidation and rename. All files within the  
 14604 interpreter have been renamed as well as most header files. This  
 14605 was done to prevent collisions with existing files in the host  
 14606 OSs -- filenames such as "config.h" and "global.h" seem to be  
 14607 quite common. The VC project files have been updated. All

14608 makefiles will require modification.

14610 The parser/interpreter integration continues in Phase 5 with the  
14611 implementation of a complete 2-pass parse (the AML is parsed  
14612 twice) for each table; This avoids the construction of a huge  
14613 parse tree and therefore reduces the amount of dynamic memory  
14614 required by the subsystem. Greater use of the parse object cache  
14615 means that performance is unaffected.

14617 Many comments from the two code reviews have been rolled in.

14619 The 64-bit alignment support is complete.

14621 -----  
14622 Summary of changes for this label: 06\_30\_00

14624 With a nod and a tip of the hat to the technology of yesteryear,  
14625 we've added support in the source code for 80 column output  
14626 devices. The code is now mostly constrained to 80 columns or  
14627 less to support environments and editors that 1) cannot display  
14628 or print more than 80 characters on a single line, and 2) cannot  
14629 disable line wrapping.

14631 A major restructuring of the namespace data structure has been  
14632 completed. The result is 1) cleaner and more  
14633 understandable/maintainable code, and 2) a significant reduction  
14634 in the dynamic memory requirement for each named ACPI object  
14635 (almost half).

14637 -----  
14638 Summary of changes for this label: 06\_23\_00

14640 Linux support has been added. In order to obtain approval to get  
14641 the ACPI CA subsystem into the Linux kernel, we've had to make  
14642 quite a few changes to the base subsystem that will affect all  
14643 users (all the changes are generic and OS- independent). The  
14644 effects of these global changes have been somewhat far reaching.  
14645 Files have been merged and/or renamed and interfaces have been  
14646 renamed. The major changes are described below.

14648 Osd\* interfaces renamed to AcpiOs\* to eliminate namespace  
14649 pollution/confusion within our target kernels. All OSD  
14650 interfaces must be modified to match the new naming convention.

14652 Files merged across the subsystem. A number of the smaller source  
14653 and header files have been merged to reduce the file count and  
14654 increase the density of the existing files. There are too many  
14655 to list here. In general, makefiles that call out individual  
14656 files will require rebuilding.

14658 Interpreter files renamed. All interpreter files now have the  
14659 prefix am\* instead of ie\* and is\*.

14661 Header files renamed: The acapi.h file is now acpixf.h. The  
14662 apciiosd.h file is now apciiosxf.h. We are removing references to  
14663 the acronym "API" since it is somewhat windowsy. The new name is  
14664 "external interface" or xface or xf in the filenames.j

14667 All manifest constants have been forced to upper case (some were  
14668 mixed case.) Also, the string "ACPI\_" has been prepended to many  
14669 (not all) of the constants, typedefs, and structs.

14671 The globals "DebugLevel" and "DebugLayer" have been renamed  
14672 "AcpiDbgLevel" and "AcpiDbgLayer" respectively.

14674 All other globals within the subsystem are now prefixed with  
14675 "AcpiGbl\_" Internal procedures within the subsystem are now  
14676 prefixed with "Acpi" (with only a few exceptions). The original  
14677 two-letter abbreviation for the subcomponent remains after "Acpi"  
14678 - for example, CmCAllocate became AcpiCmCAllocate.

14680 Added a source code translation/conversion utility. Used to  
14681 generate the Linux source code, it can be modified to generate  
14682 other types of source as well. Can also be used to cleanup  
14683 existing source by removing extraneous spaces and blank lines.  
14684 Found in tools/acpisrc/\*

14686 OsdUnMapMemory was renamed to OsdUnmapMemory and then  
14687 AcpiOsUnmapMemory. (UnMap became Unmap).

14689 A "MaxUnits" parameter has been added to AcpiOsCreateSemaphore.  
14690 When set to one, this indicates that the caller wants to use the

14692 semaphore as a mutex, not a counting semaphore. ACPI CA uses  
14693 both types. However, implementers of this call may want to use  
14694 different OS primitives depending on the type of semaphore  
14695 requested. For example, some operating systems provide separate

14697 "mutex" and "semaphore" interfaces - where the mutex interface is  
14698 much faster because it doesn't have all the overhead of a full  
14699 semaphore implementation.

14701 Fixed a deadlock problem where a method that accesses the PCI  
14702 address space can block forever if it is the first access to the  
14703 space.

14705 -----  
14706 Summary of changes for this label: 06\_02\_00

14708 Support for environments that cannot handle unaligned data  
14709 accesses (e.g. firmware and OS environments devoid of alignment  
14710 handler technology namely SAL/EFI and the IA-64 Linux kernel) has  
14711 been added (via configurable macros) in these three areas: -  
14712 Transfer of data from the raw AML byte stream is done via byte  
14713 moves instead of word/dword/qword moves. - External objects are  
14714 aligned within the user buffer, including package elements (sub-  
14715 objects). - Conversion of name strings to UINT32 Acpi Names is now  
14716 done byte-wise.

14718 The Store operator was modified to mimic Microsoft's  
14719 implementation when storing to a Buffer Field.

14721 Added a check of the BM\_STS bit before entering C3.

14723 The methods subdirectory has been obsoleted and removed. A new  
14724 file, cmeval.c subsumes the functionality.

14726 A 16-bit (DOS) version of AcpiExec has been developed. The  
14727 makefile is under the acpiexec directory.

742 *
743 * RETURN:      Status
744 *
745 * DESCRIPTION: Common low-level function to insert a new name into the global
746 *              list of Externals which will in turn be later emitted as
747 *              External() declarations in the disassembled output.
748 *
749 *              Note: The external name should not include a root prefix
750 *              (backslash). We do not want External() statements to contain
751 *              a leading '\', as this prevents duplicate external statements
752 *              of the form:
753 *
754 *                  External (\ABCD)
755 *                  External (ABCD)
756 *
757 *              This would cause a compile time error when the disassembled
758 *              output file is recompiled.
759 *
760 *              There are two cases that are handled here. For both, we emit
761 *              an External() statement:
762 *              1) The name was simply not found in the namespace.
763 *              2) The name was found, but it originated in a table other than
764 *              the table that is being disassembled.

1175 #if 0
1176 Summary of the external control method problem:

1178 When the -e option is used with disassembly, the various SSDTs are simply
1179 loaded into a global namespace for the disassembler to use in order to

```

1180 resolve control method references (invocations).  
 1182 The disassembler tracks any such references, and will emit an External()  
 1183 statement for these types of methods, with the proper number of arguments .

1185 Without the SSDTs, the AML does not contain enough information to properly  
 1186 disassemble the control method invocation -- because the disassembler does  
 1187 not know how many arguments to parse.

1189 An example: Assume we have two control methods. ABCD has one argument, and  
 1190 EFGH has zero arguments. Further, we have two additional control methods  
 1191 that invoke ABCD and EFGH, named T1 and T2:

```
1193 Method (ABCD, 1)
1194 {
1195 }
1196 Method (EFGH, 0)
1197 {
1198 }
1199 Method (T1)
1200 {
1201     ABCD (Add (2, 7, Local0))
1202 }
1203 Method (T2)
1204 {
1205     EFGH ()
1206     Add (2, 7, Local0)
1207 }
```

1209 Here is the AML code that is generated for T1 and T2:

```
1211 185: Method (T1)
1213 0000034C: 14 10 54 31 5F 5F 00 ... "..T1__."
1215 186: {
1216 187:     ABCD (Add (2, 7, Local0))
1218 00000353: 41 42 43 44 ..... "ABCD"
1219 00000357: 72 0A 02 0A 07 60 ..... "r...."
1221 188: }
1223 190: Method (T2)
1225 0000035D: 14 10 54 32 5F 5F 00 ... "..T2__."
1227 191: {
1228 192:     EFGH ()
1230 00000364: 45 46 47 48 ..... "EFGH"
1232 193:     Add (2, 7, Local0)
1234 00000368: 72 0A 02 0A 07 60 ..... "r...."
1235 194: }
```

1237 Note that the AML code for T1 and T2 is essentially identical. When  
 1238 disassembling this code, the methods ABCD and EFGH must be known to the  
 1239 disassembler, otherwise it does not know how to handle the method invocations.

1241 In other words, if ABCD and EFGH are actually external control methods  
 1242 appearing in an SSDT, the disassembler does not know what to do unless  
 1243 the owning SSDT has been loaded via the -e option.

50 #define _COMPONENT          ACPI_CA_DISASSEMBLER
51 #define ACPI_MODULE_NAME    ("dmtdbinfo")

53 /*
54 * How to add a new table:
55 *
56 * - Add the C table definition to the actbl1.h or actbl2.h header.
57 * - Add ACPI_xxxx_OFFSET macro(s) for the table (and subtables) to list below.
58 * - Define the table in this file (for the disassembler). If any

```

```

59 * new data types are required (ACPI_DMT_*), see below.
60 * - Add an external declaration for the new table definition (AcpiDmTableInfo*)
61 * in acdisasm.h
62 * - Add new table definition to the dispatch table in dmtdb.c (AcpiDmTableDat
63 * If a simple table (with no subtables), no disassembly code is needed.
64 * Otherwise, create the AcpiDmDump* function for to disassemble the table
65 * and add it to the dmtdb.c file.
66 * - Add an external declaration for the new AcpiDmDump* function in acdisasm.h
67 * - Add the new AcpiDmDump* function to the dispatch table in dmtdb.c
68 * - Create a template for the new table
69 * - Add data table compiler support
70 *
71 * How to add a new data type (ACPI_DMT_*):
72 *
73 * - Add new type at the end of the ACPI_DMT list in acdisasm.h
74 * - Add length and implementation cases in dmtdb.c (disassembler)
75 * - Add type and length cases in dtutils.c (DT compiler)

819 * Note concerning support for "module-level code".
820 *
821 * ACPI 1.0 allowed Type1 and Type2 executable opcodes outside of control
822 * methods (the so-called module-level code.) This support was explicitly
823 * removed in ACPI 2.0, but this type of code continues to be created by
824 * BIOS vendors. In order to support the disassembly and recompilation of
825 * such code (and the porting of ASL code to iASL), iASL supports this
826 * code in violation of the current ACPI specification.
827 *
828 * The grammar change to support module-level code is to revert the
829 * {ObjectList} portion of the DefinitionBlockTerm in ACPI 2.0 to the
830 * original use of {TermList} instead (see below.) This allows the use
831 * of Type1 and Type2 opcodes at module level.

530 /*****
531 *
532 * FUNCTION:      OpcDoEisaId
533 *
534 * PARAMETERS:   Op          - Parse node
535 *
536 * RETURN:       None
537 *
538 * DESCRIPTION:  Convert a string EISA ID to numeric representation. See the
539 *               Pnp BIOS Specification for details. Here is an excerpt:
540 *
541 *               A seven character ASCII representation of the product
542 *               identifier compressed into a 32-bit identifier. The seven
543 *               character ID consists of a three character manufacturer code,
544 *               a three character hexadecimal product identifier, and a one
545 *               character hexadecimal revision number. The manufacturer code
546 *               is a 3 uppercase character code that is compressed into 3 5-bit
547 *               values as follows:
548 *               1) Find hex ASCII value for each letter
549 *               2) Subtract 40h from each ASCII value
550 *               3) Retain 5 least significant bits for each letter by
551 *                  discarding upper 3 bits because they are always 0.
552 *               4) Compressed code = concatenate 0 and the 3 5-bit values
553 *
554 *               The format of the compressed product identifier is as follows:
555 *               Byte 0: Bit 7          - Reserved (0)
556 *                       Bits 6-2:      - 1st character of compressed mfg code
557 *                       Bits 1-0       - Upper 2 bits of 2nd character of mfg code
558 *               Byte 1: Bits 7-5       - Lower 3 bits of 2nd character of mfg code
559 *                       Bits 4-0       - 3rd character of mfg code
560 *               Byte 2: Bits 7-4       - 1st hex digit of product number
561 *                       Bits 3-0       - 2nd hex digit of product number
562 *               Byte 3: Bits 7-4       - 3rd hex digit of product number
563 *                       Bits 3-0       - Hex digit of the revision number
564 *
