310 #if (!ACPI_REDUCED_HARDWARE)
311 /*****
312 *
313 * FUNCTION:      AcpiReadBitRegister
314 *
315 * PARAMETERS:    RegisterId      - ID of ACPI Bit Register to access
316 *                ReturnValue      - Value that was read from the register,
317 *                                normalized to bit position zero.
318 *
319 * RETURN:        Status and the value read from the specified Register. Value
320 *                returned is normalized to bit0 (is shifted all the way right)
321 *
322 * DESCRIPTION:   ACPI BitRegister read function. Does not acquire the HW lock.
323 *
324 * SUPPORTS:      Bit fields in PM1 Status, PM1 Enable, PM1 Control, and
325 *                PM2 Control.
326 *
327 * Note: The hardware lock is not required when reading the ACPI bit registers
328 *        since almost all of them are single bit and it does not matter that
329 *        the parent hardware register can be split across two physical
330 *        registers. The only multi-bit field is SLP_TYP in the PM1 control
331 *        register, but this field does not cross an 8-bit boundary (nor does
332 *        it make much sense to actually read this field.)

496 /*****
497  *
498  * FUNCTION:      AcpiGetSleepTypeData
499  *
500  * PARAMETERS:    SleepState      - Numeric sleep state
501  *                *SleepTypeA     - Where SLP_TYPa is returned
502  *                *SleepTypeB     - Where SLP_TYPb is returned
503  *
504  * RETURN:        Status
505  * RETURN:        Status - ACPI status
506  *
507  * DESCRIPTION:   Obtain the SLP_TYPa and SLP_TYPb values for the requested
508  *                sleep state via the appropriate \_Sx object.
509  * DESCRIPTION:   Obtain the SLP_TYPa and SLP_TYPb values for the requested sleep
510  *                state.
511  *
512  * The sleep state package returned from the corresponding \_Sx object
513  * must contain at least one integer.
514  *
515  * March 2005:
516  * Added support for a package that contains two integers. This
517  * goes against the ACPI specification which defines this object as a
518  * package with one encoded DWORD integer. However, existing practice
519  * by many BIOS vendors is to return a package with 2 or more integer
520  * elements, at least one per sleep type (A/B).
521  *
522  * January 2013:
523  * Therefore, we must be prepared to accept a package with either a
524  * single integer or multiple integers.
525  *
526  * The single integer DWORD format is as follows:
527  *   BYTE 0 - Value for the PM1A SLP_TYP register
528  *   BYTE 1 - Value for the PM1B SLP_TYP register
529  *   BYTE 2-3 - Reserved
530  *
531  * The dual integer format is as follows:
532  *   Integer 0 - Value for the PM1A SLP_TYP register
533  *   Integer 1 - Value for the PM1B SLP_TYP register

57 *
58 * This module validates predefined ACPI objects that appear in the namespace,
59 * at the time they are evaluated (via AcpiEvaluateObject). The purpose of this
```

new/usr/src/common/acpica/components/namespace/nspredef.c

2

```
60 * validation is to detect problems with BIOS-exposed predefined ACPI objects
61 * before the results are returned to the ACPI-related drivers.
62 *
63 * There are several areas that are validated:
64 *
65 * 1) The number of input arguments as defined by the method/object in the
66 * ASL is validated against the ACPI specification.
67 * 2) The type of the return object (if any) is validated against the ACPI
68 * specification.
69 * 3) For returned package objects, the count of package elements is
70 * validated, as well as the type of each package element. Nested
71 * packages are supported.
72 *
73 * For any problems found, a warning message is issued.

53 #define _COMPONENT          ACPI_NAMESPACE
54       ACPI_MODULE_NAME    ("nsrepair")

57 /*****
58 *
59 * This module attempts to repair or convert objects returned by the
```

new/usr/src/common/acpica/components/namespace/nsrepair.c

2

```
60 * predefined methods to an object type that is expected, as per the ACPI
61 * specification. The need for this code is dictated by the many machines that
62 * return incorrect types for the standard predefined methods. Performing these
63 * conversions here, in one place, eliminates the need for individual ACPI
64 * device drivers to do the same. Note: Most of these conversions are different
65 * than the internal object conversion routines used for implicit object
66 * conversion.
67 *
68 * The following conversions can be performed as necessary:
69 *
70 * Integer -> String
71 * Integer -> Buffer
72 * String -> Integer
73 * String -> Buffer
74 * Buffer -> Integer
75 * Buffer -> String
76 * Buffer -> Package of Integers
77 * Package -> Package of one Package
78 *
79 * Additional conversions that are available:
80 * Convert a null return or zero return value to an EndTag descriptor
81 * Convert an ASCII string to a Unicode buffer
82 *
83 * An incorrect standalone object is wrapped with required outer package
84 *
85 * Additional possible repairs:
86 * Required package elements that are NULL replaced by Integer/String/Buffer
87 *

561  *
562  * FUNCTION:      AcpiNsWrapWithPackage
563  *
564  * PARAMETERS:    Info                - Method execution information block
565  *                OriginalObject      - Pointer to the object to repair.
566  *                ObjDescPtr          - The new package object is returned here
567  *
568  * RETURN:        Status, new object in *ObjDescPtr
569  *
570  * DESCRIPTION:   Repair a common problem with objects that are defined to
571  *                return a variable-length Package of sub-objects. If there is
572  *                only one sub-object, some BIOS code mistakenly simply declares
573  *                the single object instead of a Package with one sub-object.
574  *                This function attempts to repair this error by wrapping a
575  *                Package object around the original object, creating the
576  *                correct and expected Package with one sub-object.
577  *
578  *                Names that can be repaired in this manner include:
579  *                _ALR, _CSD, _HPX, _MLS, _PLD, _PRT, _PSS, _TRT, _TSS,
580  *                _BCL, _DOD, _FIX, _Sx

70 *
71 * PARAMETERS: TargetName - Ascii ACPI name to search for
72 * ParentNode - Starting node where search will begin
73 * Type - Object type to match
74 * ReturnNode - Where the matched Named obj is returned
75 *
76 * RETURN: Status
77 *
78 * DESCRIPTION: Search a single level of the namespace. Performs a
79 * simple search of the specified level, and does not add
80 * entries or search parents.
81 *
82 *
83 * Named object lists are built (and subsequently dumped) in the
84 * order in which the names are encountered during the namespace load;
85 *
86 * All namespace searching is linear in this implementation, but
87 * could be easily modified to support any improved search
88 * algorithm. However, the linear search was chosen for simplicity
89 * and because the trees are small and the other interpreter
90 * execution overhead is relatively high.
91 *
92 * Note: CPU execution analysis has shown that the AML interpreter spends
93 * a very small percentage of its time searching the namespace. Therefore,
94 * the linear search seems to be sufficient, as there would seem to be
95 * little value in improving the search.

502  * FUNCTION:      AcpiNsResolveReferences
503  *
504  * PARAMETERS:    Info              - Evaluation info block
505  *
506  * RETURN:        Info->ReturnObject is replaced with the dereferenced object
507  *
508  * DESCRIPTION:   Dereference certain reference objects. Called before an
509  *                internal return object is converted to an external ACPI_OBJECT.
510  *
511  * Performs an automatic dereference of Index and RefOf reference objects.
512  * These reference objects are not supported by the ACPI_OBJECT, so this is a
513  * last resort effort to return something useful. Also, provides compatibility
514  * with other ACPI implementations.
515  *
516  * NOTE: does not handle references within returned package objects or nested
517  * references, but this support could be added later if found to be necessary.
518  *

452 *                 Expand 32-bit addresses to 64-bit as necessary. Also validate
453 *                 important fields within the FADT.
454 */

```

```

455 * NOTE:          AcpiGbl_FADT must be of size (ACPI_TABLE_FADT), and must
456 *                contain a copy of the actual BIOS-provided FADT.
457 *
458 * Notes on 64-bit register addresses:
459 *
460 * After this FADT conversion, later ACPICA code will only use the 64-bit "X"
461 * fields of the FADT for all ACPI register addresses.
462 *
463 * The 64-bit X fields are optional extensions to the original 32-bit FADT
464 * V1.0 fields. Even if they are present in the FADT, they are optional and
465 * are unused if the BIOS sets them to zero. Therefore, we must copy/expand
466 * 32-bit V1.0 fields to the 64-bit X fields if the the 64-bit X field is
467 * originally zero.
468 *
469 * For ACPI 1.0 FADTs (that contain no 64-bit addresses), all 32-bit address
470 * fields are expanded to the corresponding 64-bit X fields in the internal
471 * common FADT.
472 *
473 * For ACPI 2.0+ FADTs, all valid (non-zero) 32-bit address fields are expanded
474 * to the corresponding 64-bit X fields, if the 64-bit field is originally
475 * zero. Adhering to the ACPI specification, we completely ignore the 32-bit
476 * field if the 64-bit field is valid, regardless of whether the host OS is
477 * 32-bit or 64-bit.
478 *
479 * Possible additional checks:
480 * (AcpiGbl_FADT.PmlEventLength >= 4)
481 * (AcpiGbl_FADT.PmlControlLength >= 2)
482 * (AcpiGbl_FADT.PmTimerLength >= 4)
483 * Gpe block lengths must be multiple of 2
484 *

62 *          RegionNode      - OpRegion namespace node
63 *
64 * RETURN:       Status
65 *
66 * DESCRIPTION:  Add the Operation Region address range to the global list.
67 *               The only supported Space IDs are Memory and I/O. Called when
68 *               the OpRegion address/length operands are fully evaluated.
69 *
70 * MUTEX:        Locks the namespace
71 *
72 * NOTE: Because this interface is only called when an OpRegion argument
73 * list is evaluated, there cannot be any duplicate RegionNodes.
74 * Duplicate Address/Length values are allowed, however, so that multiple
75 * address conflicts can be detected.
76 *

695 *                  functions. This is the size of the Destination buffer.
696 *
697 * RETURN:        TRUE if the operation would overflow the destination buffer.
698 *
699 * DESCRIPTION:    Safe versions of standard Clib string functions. Ensure that
700 *                  the result of the operation will not overflow the output string
701 *                  buffer.
702 *
703 * NOTE:          These functions are typically only helpful for processing
704 *                  user input and command lines. For most ACPICA code, the
705 *                  required buffer length is precisely calculated before buffer
706 *                  allocation, so the use of these functions is unnecessary.
707 *

49 *
50 * Return Package types
51 *
52 * 1) PTYPE1 packages do not contain sub-packages.
53 *
54 * ACPI_PTYPE1_FIXED: Fixed-length length, 1 or 2 object types:
55 *   object type
56 *   count
57 *   object type
58 *   count
59 */
```

new/usr/src/common/acpica/include/acpredef.h

2

```
60 * ACPI_PTYPE1_VAR: Variable-length length. Zero-length package is allowed:
61 *   object type (Int/Buf/Ref)
62 *
63 * ACPI_PTYPE1_OPTION: Package has some required and some optional elements
64 *   (Used for _PRW)
65 *
66 *
67 * 2) PTYPE2 packages contain a Variable-length number of sub-packages. Each
68 *   of the different types describe the contents of each of the sub-packages.
69 *
70 * ACPI_PTYPE2: Each subpackage contains 1 or 2 object types. Zero-length
71 *   parent package is allowed:
72 *   object type
73 *   count
74 *   object type
75 *   count
76 *   (Used for _ALR, _MLS, _PSS, _TRT, _TSS)
77 *
78 * ACPI_PTYPE2_COUNT: Each subpackage has a count as first element.
79 *   Zero-length parent package is allowed:
80 *   object type
81 *   (Used for _CSD, _PSD, _TSD)
82 *
83 * ACPI_PTYPE2_PKG_COUNT: Count of subpackages at start, 1 or 2 object types:
84 *   object type
85 *   count
86 *   object type
87 *   count
88 *   (Used for _CST)
89 *
90 * ACPI_PTYPE2_FIXED: Each subpackage is of Fixed-length. Zero-length
91 *   parent package is allowed.
92 *   (Used for _PRT)
93 *
94 * ACPI_PTYPE2_MIN: Each subpackage has a Variable-length but minimum length.
95 *   Zero-length parent package is allowed:
96 *   (Used for _HPX)
97 *
98 * ACPI_PTYPE2_REV_FIXED: Revision at start, each subpackage is Fixed-length
99 *   (Used for _ART, _FPS)
100 *
101 * ACPI_PTYPE2_FIX_VAR: Each subpackage consists of some fixed-length elements
102 *   followed by an optional element. Zero-length parent package is allowed.
103 *   object type
104 *   count
105 *   object type
106 *   count = 0 (optional)
107 *   (Used for _DLM)

167 /*****
168  *
169  * Predefined method/object information table.
170  *
171  * These are the names that can actually be evaluated via AcpiEvaluateObject.
172  * Not present in this table are the following:
173  *
174  * 1) Predefined/Reserved names that are never evaluated via
175  *    AcpiEvaluateObject:
176  *      _Lxx and _Exx GPE methods
177  *      _Qxx EC methods
178  *      _T_x compiler temporary variables
179  *      _Wxx wake events
180  *
181  * 2) Predefined names that never actually exist within the AML code:
182  *      Predefined resource descriptor field names
183  *
184  * 3) Predefined names that are implemented within ACPICA:
185  *      _OSI
186  *
187  * The main entries in the table each contain the following items:
188  *
189  * Name                - The ACPI reserved name
190  * ArgumentList         - Contains (in 16 bits), the number of required
191  *                        arguments to the method (3 bits), and a 3-bit type

```

```

192 *      field for each argument (up to 4 arguments). The
193 *      METHOD_?ARGS macros generate the correct packed data.
194 * ExpectedBtypes      - Allowed type(s) for the return value.
195 *                      0 means that no return value is expected.
196 *
197 * For methods that return packages, the next entry in the table contains
198 * information about the expected structure of the package. This information
199 * is saved here (rather than in a separate table) in order to minimize the
200 * overall size of the stored data.
201 *
202 * Note: The additional braces are intended to promote portability.
203 *
204 * Note2: Table is used by the kernel-resident subsystem, the iASL compiler,
205 * and the AcpiHelp utility.
206 *
207 * TBD: _PRT - currently ignore reversed entries. Attempt to fix in nsrepair.
208 * Possibly fixing package elements like _BIF, etc.
209 *

73 /*
74 * Architecture-specific ACPICA Subsystem Data Types
75 *
76 * The goal of these types is to provide source code portability across
77 * 16-bit, 32-bit, and 64-bit targets.
78 *
79 * 1) The following types are of fixed size for all targets (16/32/64):
80 *
81 * BOOLEAN      Logical boolean
82 *
83 * UINT8        8-bit (1 byte) unsigned value
84 * UINT16       16-bit (2 byte) unsigned value
85 * UINT32       32-bit (4 byte) unsigned value
86 * UINT64       64-bit (8 byte) unsigned value
87 *
88 * INT16        16-bit (2 byte) signed value
89 * INT32        32-bit (4 byte) signed value
90 * INT64        64-bit (8 byte) signed value
91 *
92 * COMPILER_DEPENDENT_UINT64/INT64 - These types are defined in the
93 * compiler-dependent header(s) and were introduced because there is no common
94 * 64-bit integer type across the various compilation models, as shown in
95 * the table below.
96 *
97 * Datatype  LP64  ILP64  LLP64  ILP32  LP32  16bit
98 * char      8      8      8      8      8
99 * short     16     16     16     16     16
100 * _int32    32
101 * int       32     64     32     32     16    16
102 * long      64     64     32     32     32     32
103 * long long 64     64     64     64
104 * pointer   64     64     64     32     32     32
105 *
106 * Note: ILP64 and LP32 are currently not supported.
107 *
108 *
109 * 2) These types represent the native word size of the target mode of the
110 * processor, and may be 16-bit, 32-bit, or 64-bit as required. They are
111 * usually used for memory allocation, efficient loop counters, and array
112 * indexes. The types are similar to the size_t type in the C library and are
113 * required because there is no C type that consistently represents the native
114 * data width. ACPI_SIZE is needed because there is no guarantee that a
115 * kernel-level C library is present.
116 *
117 * ACPI_SIZE      16/32/64-bit unsigned value
118 * ACPI_NATIVE_INT 16/32/64-bit signed value
119 */

115 *
116 * PARAMETERS:    None
117 *
118 * RETURN:        None
119 *
120 * DESCRIPTION:   Enter/Exit the raw character input mode for the terminal.
121 *
122 * Interactive line-editing support for the AML debugger. Used with the
```

```

123 * common/acgetline module.
124 *
125 * readline() is not used because of non-portability. It is not available
126 * on all systems, and if it is, often the package must be manually installed.
127 *
128 * Therefore, we use the POSIX tcgetattr/tcsetattr and do the minimal line
129 * editing that we need in AcpiOsGetLine.
130 *
131 * If the POSIX tcgetattr/tcsetattr interfaces are unavailable, these
132 * calls will also work:
133 *   For OsEnterLineEditMode: system ("stty cbreak -echo")
134 *   For OsExitLineEditMode: system ("stty cooked echo")
135 *

52 *
53 * ACPICA Example Code
54 *
55 * This module contains examples of how the host OS should interface to the
56 * ACPICA subsystem.
57 *
58 * 1) How to use the platform/acenv.h file and how to set configuration
59 * options.
```

new/usr/src/common/acpica/tools/examples/examples.c

2

```
60 *
61 * 2) main - using the debug output mechanism and the error/warning output
62 * macros.
63 *
64 * 3) Two examples of the ACPICA initialization sequence. The first is a
65 * initialization with no "early" ACPI table access. The second shows
66 * how to use ACPICA to obtain the tables very early during kernel
67 * initialization, even before dynamic memory is available.
68 *
69 * 4) How to invoke a control method, including argument setup and how to
70 * access the return value.
71 *

28 /*
29  *      Power Button Driver
30  *
31  *      This driver handles interrupt generated by the power button on
32  *      platforms with "power" device node which has "button" property.
33  *      Currently, these platforms are:
34  *
35  *          ACPI-enabled x86/x64 platforms
36  *          Ultra-5_10, Ultra-80, Sun-Blade-100, Sun-Blade-150,
37  *          Sun-Blade-1500, Sun-Blade-2500,
38  *          Sun-Fire-V210, Sun-Fire-V240, Netra-240
39  *
40  *      Only one instance is allowed to attach. In order to know when
41  *      an application that has opened the device is going away, a new
42  *      minor clone is created for each open(9E) request. There are
43  *      allocations for creating minor clones between 1 and 255. The iocctl
44  *      interface is defined by pbio(7I) and approved as part of
45  *      PSARC/1999/393 case.

30 /*
31 * There are three types of container objects defined in the ACPI Spec as below.
32 * PNP0A05: Generic Container Device
33 *   A device whose settings are totally controlled by its ACPI resource
34 *   information, and otherwise needs no device or bus-specific driver support.
35 *   This was originally known as Generic ISA Bus Device.
36 *   This ID should only be used for containers that do not produce resources
37 *   for consumption by child devices. Any system resources claimed by a PNP0A05
38 *   device's _CRS object must be consumed by the container itself.
39 * PNP0A06: Generic Container Device
40 *   This device behaves exactly the same as the PNP0A05 device.
41 *   This was originally known as Extended I/O Bus.
42 *   This ID should only be used for containers that do not produce resources
43 *   for consumption by child devices. Any system resources claimed by a PNP0A06
44 *   device's _CRS object must be consumed by the container itself.
45 * ACPI0004: Module Device.
46 *   This device is a container object that acts as a bus node in a namespace.
47 *   A Module Device without any of the _CRS, _PRS and _SRS methods behaves
48 *   the same way as the Generic Container Devices (PNP0A05 or PNP0A06).
49 *   If the Module Device contains a _CRS method, only the resources
50 *   described in the _CRS are available for consumption by its child devices.
51 *   Also, the Module Device can support _PRS and _SRS methods if _CRS is
52 *   supported.

26 /*
27 * Platform specific device enumerator for ACPI specific devices.
28 * "x86 system devices" refers to the suite of hardware components which are
29 * common to the x86 platform and play important roles in the system
30 * architecture but can't be enumerated/discovered through industry-standard
31 * bus specifications. Examples of these x86 system devices include:
32 *   * Logical processor/CPU
33 *   * Memory device
34 *   * Non-PCI discoverable IOMMU or DMA Remapping Engine
35 *   * Non-PCI discoverable IOxAPIC
36 *   * Non-PCI discoverable HPET (High Precision Event Timer)
37 *   * ACPI defined devices, including power button, sleep button, battery etc.
38 *
39 * X86 system devices may be discovered through BIOS/Firmware interfaces, such
40 * as SMBIOS tables, MPS tables and ACPI tables since their discovery isn't
41 * covered by any industry-standard bus specifications.
42 *
43 * In order to aid Solaris in flexibly managing x86 system devices,
44 * x86 system devices are placed into a specific firmware device
45 * subtree whose device path is '/devices/fw'.
46 *
47 * This driver populates the firmware device subtree with ACPI-discoverable
48 * system devices if possible. To achieve that, the ACPI object
49 * namespace is abstracted as ACPI virtual buses which host system devices.
50 * Another nexus driver for the ACPI virtual bus will manage all devices
51 * connected to it.
52 *
53 * For more detailed information, please refer to PSARC/2009/104.

134  * If enabled, the distribution works as follows:
135  * On every interrupt entry, the current ipl for the CPU is set in cpu_info
136  * and the irq corresponding to the ipl is also set in the aci_current array.
137  * interrupt exit and setspl (due to soft interrupts) will cause the current
138  * ipl to be changed. This is cache friendly as these frequently used
139  * paths write into a per cpu structure.
140  *
141  * Sampling is done by checking the structures for all CPUs and incrementing
142  * the busy field of the irq (if any) executing on each CPU and the busy field
143  * of the corresponding CPU.
144  * In periodic mode this is done on every clock interrupt.
145  * In one-shot mode, this is done thru a cyclic with an interval of
146  * apic_redistribute_sample_interval (default 10 milli sec).
147  *

38 /*
39 * Solaris uses an HPET Timer to generate interrupts for CPUs in Deep C-state
40 * with stalled LAPIC Timers. All CPUs use one HPET timer. The timer's
41 * interrupt targets one CPU (via the I/O APIC). The one CPU that receives
42 * the HPET's interrupt wakes up other CPUs as needed during the HPET Interrupt
43 * Service Routing. The HPET ISR uses poke_cpus to wake up other CPUs with an
44 * Inter Processor Interrupt.
45 *
46 * Please see the Intel Programmer's guides. Interrupts are disabled before
47 * a CPU Halts into Deep C-state. (This allows CPU-hardware-specific cleanup
48 * before servicing interrupts.) When a Deep C-state CPU wakes up (due to
49 * an externally generated interrupt), it resume execution where it halted.
50 * The CPU returning from Deep C-state must enable interrupts before it will
51 * handle the pending interrupt that woke it from Deep C-state.
52 *
53 *
54 * HPET bits as defined in the Intel IA-PC HPET Specification Rev 1.0a.
55 *
56 * The physical address space layout of the memory mapped HPET looks like this:
57 *
58 * struct hpet {
59 *     uint64_t         gen_cap;
```

new/usr/src/uts/i86pc/sys/hpet\_acpi.h

2

```
60 *     uint64_t         res1;
61 *     uint64_t         gen_config;
62 *     uint64_t         res2;
63 *     uint64_t         gen_inter_stat;
64 *     uint64_t         res3;
65 *     uint64_t         main_counter_value;
66 *     uint64_t         res4;
67 *     struct hpet_timer {
68 *         uint64_t         config_and_capability;
69 *         uint64_t         comparator_value;
70 *         uint64_t         FSB_interrupt_route;
71 *         uint64_t         reserved;
72 *     } timers[32];
73 * }
74 *
75 * There are 32 possible timers in an hpet. Only the first 3 timers are
76 * required. The other 29 timers are optional.
77 *
78 * HPETs can have 64-bit or 32-bit timers. Timers/compare registers can
79 * be 64-bit or 32-bit and can be a mixture of both.
80 * The first two timers are not used. The HPET spec intends the first two
81 * timers to be used as "legacy replacement" for the PIT and RTC timers.
82 *
83 * Solaris uses the first available non-legacy replacement timer as a proxy
84 * timer for processor Local APIC Timers that stop in deep idle C-states.
85 */

30 # This Makefile defines all file modules and build rules for the
31 # directory uts/intel and its children. These are the source files which
32 # are specific to the intel processor.
33 #
34 # The following two-level ordering must be maintained in this file.
35 # Lines are sorted first in order of decreasing specificity based on
36 # the first directory component. That is, sun4u rules come before
37 # sparc rules come before common rules.
38 #
39 # Lines whose initial directory components are equal are sorted
40 # alphabetically by the remaining components.
41 #
42 #
43 # Need a way to distinguish between the ia32 and amd64 subdirs.
44 #
45 SUBARCH_DIR_32 = ia32
46 SUBARCH_DIR_64 = amd64
