\*\*\*\*\*

```
1 How to add a new ACPI table to ACPICA and the iASL compiler.
2 -----

4 There are four main tasks that are needed to provide support for a
5 new ACPI table:
6 1) Create a full definition of the table and any subtables
7   in the ACPICA headers.
8 2) Add disassembler support for the new table
9 3) Add iASL table compiler support for the new table
10 4) Create a default template for the new table for iASL -T
11   option.

13 Notes for each of these tasks provided below.

16 1) Header Support
17 -----

19 New tables should be added to the appropriate header:
20 actbl2.h: Used for new tables that are not defined in the ACPI spec.
21 actbl3.h: Used for new tables that are defined in the ACPI spec.

23 Use ACPI_TABLE_HEADER for the common ACPI table header.
24 Subtables should be defined separately from the main table.
25 Don't add placeholder fields for subtables and other multiple data items.
26 (Don't use xxxxx[1] for a field that can have multiple items.)
27 The disassembler and data table compiler depends on this.
28 For tables not defined in the ACPI spec, add a comment to indicate where
29 the table came from.
30 Use other table definitions for additional guidance.

33 2) iASL Disassembler Support
34 -----

36 Add definition of the table (and subtables) in common/dmtdbinfo.c
37 Add table access macro(s) of the form ACPI_xxxx_OFFSET
38 Add ACPI_DMT_TERMINATOR at the end of every table/subtable definition

40 Add externals for the table/subtable definitions in acdisasm.h
41 Add an entry for the new table in the AcpiDmTableData in common/dmtdbtable.c

43 If there are no subtables, add the AcpiDmTableInfoXXXX name to the
44 AcpiDmTableData and it will automatically be disassembled.

46 If there are subtables, a dump routine must be written:
47 Add an AcpiDmDumpXXXX function to dmtdbdump.c -- note, code for another
48 similar table can often be ported for the new table.
49 Add an external for this function to acdisasm.h
50 Add this function to the AcpiDmTableData entry for the new ACPI table

52 Debug/Test: Either find an existing example of the new ACPI table, or
53 create one using the "generic ACPI table support" included in the
54 iASL data table compiler. Use the -G option to force a
55 generic compile. It is often best to create the table from scratch,
56 since this clearly exposes the dependencies (lengths, offsets, etc.)
57 that the Table Compiler support will need to generate.

60 3) iASL Table Compiler Support
61 -----
```

new/usr/src/common/acpica/compiler/new\_table.txt

2

```
63 Simple tables do not require a compile routine. The definition of the
64 table in common/dmtdbinfo.c (created in step 2 above) will suffice.

66 Complex tables with subtables will require a compile routine with a name
67 of the form DtCompileXXXX.
68 Add a DtCompileXXXX function to the dtdtable.c module.
69 Add an external for this function in dtcompiler.h
70 Add this function to the AcpiDmTableData entry for the new ACPI table
71 in common/dmtdbtable.c

74 4) Template Support (-T iASL option)
75 -----

77 Create an example of the new ACPI table. This example should create
78 multiple subtables (if supported), and multiple instances of any
79 variable length data.

81 Compile the example file with the -sc option. This will create a C
82 array that contains the table contents.

84 Add this array to the dtdtemplate.h file. Name the array TemplateXXXX.
85 Add this array name to the AcpiDmTableData entry for the new ACPI table

87 Debug/Test: Create the template file. Compile the file. Disassemble the file.
88 Compile the disassembly file.

1

\*\*\*\*\*

4383 Fri Jan 17 07:29:46 2014  
new/usr/src/common/acpica/compiler/readme.txt  
update to acpica-unix2-20131218  
acpica-unix2-20130823  
\*\*\*\*\*

```
1 /*
2  * Miscellaneous instructions for building and using the iASL compiler.
3  */
4 Last update 9 December 2013.
```

```
7 1) Generating iASL from source
8 -----
```

10 Generation of the ASL compiler from source code requires these items:

- 12 1) The ACPICA source code tree.
- 13 2) An ANSI C compiler.
- 14 3) The Flex (or Lex) lexical analyzer generator.
- 15 4) The Bison (or Yacc) parser generator.

17 There are three major ACPICA source code components that are required to  
18 generate the compiler (Basically, the entire ACPICA source tree should  
19 be installed):

- 21 1) The ASL compiler source.
- 22 2) The ACPICA Core Subsystem source. In particular, the Namespace  
23 Manager component is used to create an internal ACPI namespace  
24 and symbol table, and the AML Interpreter is used to evaluate  
25 constant expressions.
- 26 3) The "common" source directory that is used for all ACPI components.

```
29 1a) Notes for Linux/Unix generation
30 -----
```

32 iASL has been generated with these versions of Flex/Bison:

```
34 flex: Version 2.5.32
35 bison: Version 2.6.2
```

37 Other required packages:

```
39 make
40 gcc C compiler
41 m4 (macro processor required by bison)
```

43 On Linux/Unix systems, the following commands will build the compiler:

```
45 cd acpica (or cd acpica/generate/unix)
46 make clean
47 make iasl
```

```
50 1b) Notes for Windows generation
51 -----
```

53 On Windows, the Visual Studio 2008 project file appears in this directory:

```
55 generate/msvc9/AcpiComponents.sln
```

57 The Windows versions of GNU Flex/Bison must be installed, and they must  
58 be installed in a directory that contains no embedded spaces in the  
59 pathname. They cannot be installed in the default "c:\Program Files"  
60 directory. This is a bug in Bison. The default Windows project file for

new/usr/src/common/acpica/compiler/readme.txt

2

61 iASL assumes that these tools are installed at this location:

```
63 c:\GnuWin32
```

65 Once the tools are installed, ensure that this path is added to the  
66 default system \$Path environment variable:

```
68 c:\GnuWin32\bin
```

70 Goto: ControlPanel/System/AdvancedSystemSettings/EnvironmentVariables

72 Important: Now Windows must be rebooted to make the system aware of  
73 the updated \$Path. Otherwise, Bison will not be able to find the M4  
74 interpreter library and will fail.

76 iASL has been generated with these versions of Flex/Bison for Windows:

```
78 Flex for Windows: V2.5.4a
79 Bison for Windows: V2.4.1
```

81 Flex is available at: <http://gnuwin32.sourceforge.net/packages/flex.htm>  
82 Bison is available at: <http://gnuwin32.sourceforge.net/packages/bison.htm>

```
86 2) Integration as a custom tool for Visual Studio
87 -----
```

89 This procedure adds the iASL compiler as a custom tool that can be used  
90 to compile ASL source files. The output is sent to the VC output  
91 window.

93 a) Select Tools->Customize.

95 b) Select the "Tools" tab.

97 c) Scroll down to the bottom of the "Menu Contents" window. There you  
98 will see an empty rectangle. Click in the rectangle to enter a  
99 name for this tool.

101 d) Type "iASL Compiler" in the box and hit enter. You can now edit  
102 the other fields for this new custom tool.

104 e) Enter the following into the fields:

```
106 Command: C:\Acpi\iasl.exe
107 Arguments: -vi "$(FilePath)"
108 Initial Directory "$(FileDir)"
109 Use Output Window <Check this option>
```

111 "Command" must be the path to wherever you copied the compiler.  
112 "-vi" instructs the compiler to produce messages appropriate for VC.  
113 Quotes around FilePath and FileDir enable spaces in filenames.

115 f) Select "Close".

117 These steps will add the compiler to the tools menu as a custom tool.  
118 By enabling "Use Output Window", you can click on error messages in  
119 the output window and the source file and source line will be  
120 automatically displayed by VC. Also, you can use F4 to step through  
121 the messages and the corresponding source line(s).

```
125 3) Integrating iASL into a Visual Studio ASL project build
126 -----
```

```
128 This procedure creates a project that compiles ASL files to AML.  
130 a) Create a new, empty project and add your .ASL files to the project  
132 b) For all ASL files in the project, specify a custom build (under  
133 Project/Settings/CustomBuild with the following settings (or similar):  
  
135 Commands:  
136     c:\acpi\libraries\iasl.exe -vs -vi "$(InputPath)"  
  
138 Output:  
139     $(InputDir)\$(InputPath).aml
```

```

55 /*
56 * Note: History of _PRW support in ACPIA
57 *
58 * Originally (2000 - 2010), the GPE initialization code performed a walk of
```

new/usr/src/common/acpica/components/events/evgpeinit.c

2

```
59 * the entire namespace to execute the _PRW methods and detect all GPEs
60 * capable of waking the system.
61 *
62 * As of 10/2010, the _PRW method execution has been removed since it is
63 * actually unnecessary. The host OS must in fact execute all _PRW methods
64 * in order to identify the device/power-resource dependencies. We now put
65 * the onus on the host OS to identify the wake GPEs as part of this process
66 * and to inform ACPIA of these GPEs via the AcpiSetupGpeForWake interface. Thi
67 * not only reduces the complexity of the ACPIA initialization code, but in
68 * some cases (on systems with very large namespaces) it should reduce the
69 * kernel boot time as well.

451     * However, the memory region is not guaranteed to remain stable and
452     * we must copy the table to a local buffer. For example, the memory
453     * region is corrupted after suspend on some machines. Dynamically
454     * loaded tables are usually small, so this overhead is minimal.
455     *
456     * The latest implementation (5/2009) does not use a mapping at all.
457     * We use the low-level operation region interface to read the table
458     * instead of the obvious optimization of using a direct mapping.
459     * This maintains a consistent use of operation regions across the
460     * entire subsystem. This is important if additional processing must
461     * be performed in the (possibly user-installed) operation region
462     * handler. For example, AcpiExec and ASLTS depend on this.

59 /*!
60 * Naming convention for AML interpreter execution routines.
61 *
62 * The routines that begin execution of AML opcodes are named with a common
63 * convention based upon the number of arguments, the number of target operands,
64 * and whether or not a value is returned:
65 *
66 * AcpiExOpcode_xA_yT_zR
67 *
68 * Where:
69 *
70 * xA - ARGUMENTS: The number of arguments (input operands) that are
71 * required for this opcode type (1 through 6 args).
72 * yT - TARGETS: The number of targets (output operands) that are required
73 * for this opcode type (0, 1, or 2 targets).
74 * zR - RETURN VALUE: Indicates whether this opcode type returns a value
75 * as the function return (0 or 1).
76 *
77 * The AcpiExOpcode* functions are called via the Dispatcher component with
78 * fully resolved operands.

2

```
58 * Naming convention for AML interpreter execution routines.
59 *
60 * The routines that begin execution of AML opcodes are named with a common
61 * convention based upon the number of arguments, the number of target operands,
62 * and whether or not a value is returned:
63 *
64 *     AcpiExOpcode_xA_yT_zR
65 *
66 * Where:
67 *
68 * xA - ARGUMENTS:   The number of arguments (input operands) that are
69 *                   required for this opcode type (1 through 6 args).
70 * yT - TARGETS:     The number of targets (output operands) that are required
71 *                   for this opcode type (0, 1, or 2 targets).
72 * zR - RETURN VALUE: Indicates whether this opcode type returns a value
73 *                   as the function return (0 or 1).
74 *
75 * The AcpiExOpcode* functions are called via the Dispatcher component with
76 * fully resolved operands.
